IT appeared that I had wounded Monsieur le Vicomte severely. I believe he was a better fencer than I; but I was stronger, also I was coldly furious. Afterwards (it was then about five o'clock in the morning) I asked admittance to the apartments of Madame de Pompadour for the purpose of taking Eelin away. I found what I expected. Eelin was sitting alone, twisting and untwisting her little hands. Madame was in bed in the next room, shouting consolation from time to time. I could hear the brave, pitiful little voice choking over some courteous reply to madame's condolences. 'Yes, he is a brave fighter, madame. You will excuse me; but I was ill before I left home, otherwise we are used to swords.' Then silence. The yawning lackey admitted me. We forgot madame and everybody else for a time. Eelin was telling me how, last night, De Longville had spoken to her—had said he loved her. 'Love!' said little Eelin. 'As if *they* knew what love was!'

'What didst thou say, child?' I said, wishing sincerely I had finished De Longville once and for all.

'I?' said Eelin. 'I curtsied and I said, "Monsieur will do well to repeat his words to the MacColla; otherwise I myself will repeat them."'

'I did hear them from him,' I said. 'I was furious. I am very proud of thee, darling.'

'A very pretty scene,' said madame, appearing in the doorway in a state of elegant undress. She insisted upon our remaining to breakfast with her. So we drank her excellent coffee gratefully. She talked all the time. Eelin was very quiet. I talked to madame, but somehow my eyes kept wandering to the eyes I loved, and I saw that the soft colour was coming back to the pale, sweet face.

Madame laughed suddenly, and her laugh did not sound quite real. '*Mon dieu*, what lovers!' she said. 'It is as one reads in the old stories with you two.'

Eelin's eyes met hers softly. 'Madame understands?' she said.

'No,' said madame simply; 'I do not understand. I can wonder at it, but that is all. It is not for me—eh, Æneas the Greek?' She turned to me sharply, giving me the King's nickname, as she often did.

The look in her eyes seemed to frighten Eelin in some way, for she turned to me; and—what did madame matter?—I took her in my arms, and she hid her face against my breast. Then I spoke to

madame. 'I will take her away. Thank you again for your kindness, madame.'

'Yes,' said madame slowly, 'it will be best—to take her away.'

Then suddenly Eelin seemed to recover herself, and she thanked her also, then put up her face to kiss madame. I heard madame choke back a sob as she bent and kissed Eelin. Then she turned to me, and I bowed and kissed her hand.

'With your wife's permission, not my hand, Æneas,' she said, laughing unsteadily.

So I bent and saluted La Pompadour. Then we turned and left her.

Thus, whatever the world may say of La Pompadour, she has my homage, for she is a fair woman, and kind, because she had goodwill towards the one whom I love above all things.

. . . . . .

Next day we went to Provence. When we do go to Paris now things are rather different. As Armand de Gascon said once, 'There is something in being six-foot-five and looking like a fury when one is insulted.' Through all things La Pompadour is our friend. So we live. Some day, perhaps, we shall go home, little Eelin and I—who knows? But I know it will be changed for the worse. For the rest, 'Mayst thou know such good love,' were my father's last words to me. And I know it! I know it! She is sitting among the roses now, and her thoughts are among the sea-washed crags of Rathmor, where we met that day. In spite of our sorrow for our lost land, we know that wherever love is, that is home. For me, I know that without little Eelin, Paradise would be hell, and with her hell would be Paradise. And for her I know it is the same.

So with this, the last descendant of Æneas the Milesian, who now is Æneas of the King of France's army, bids you farewell.

THE END.

THE TRAGEDY OF THE CENCI.

PART II.

WHEN Pope Clement heard that Beatrice had finally confessed her guilt, he is reported to have said in an outburst of wild fury (we must hope, for the sake of humanity, not knowing the true facts), 'Let them all be tied to the tails of wild horses and dragged along the streets until they are dead. Let their bodies then be cast into the Tiber.' But the cardinals, in the interests of their order, united with Farinacci to dissuade the Pope from such insensate cruelty, and Clement himself when calmer did not persist in his savage resolve. Farinacci wrested, also, at last a reluctantly granted permission from the Pontiff, in behalf of himself and his colleagues, to plead the cause of the four Cenci before the criminal court.

Beatrice, James, Bernard, and the Lady Lucretia Petreni Cenci were therefore arraigned before the court on their own confession of having encompassed the death of Count Francis Cenci by hired assassins. Pale, worn by moral and physical anguish, they stood at the bar of that ruthless tribunal wan spectres of their former selves. Long and eloquent were the speeches of the three defenders of the accused, but longest and most eloquent of all was the speech of Farinacci as he pleaded passionately for the life of Beatrice. The turpitude, the insane cruelties, the unspeakable crimes of Francis Cenci were all set forth in winged words of scathing obloquy, and the trials so patiently endured for so long, the nobility of character of her who stood now before them, were forcibly dwelt upon by the great orator. As period after period rolled forth in thrilling accents, even the case-hardened judges who sat there to condemn were stirred to unwonted emotion. His concluding words were: 'Yes, Lady Beatrice has confessed to having slain her father with her own hand, but also in self-defence, and to save life and honour. She slew her father, 'tis true—how we have seen, and who the slain man was we also know. He was one who had rejoiced at the death of three of his sons, and longed for the death of the others; one who, far from protecting or loving his children, persecuted and hated them, and strove to corrupt both mind and body. Can such a man be called a father? Assuredly not. Nay, the worthier of death from his disregard of his duties and his violation of all laws human and divine. It were a profanation of the name to call Francis Cenci a father, and such my lips refuse to call him who was the jailer or executioner of his children. No, my lords; Beatrice, the pure Roman virgin, loving daughter, is no parricide, but the defender of her own outraged modesty, of her menaced life. She only struck in the last extremity, after having sought and implored the aid of man in vain. No, you cannot doom Beatrice Cenci, for if this ye do ye condemn innocence and virtue in the same breath.'

A murmur of admiration—checked, it is said, only by the presence of the Pope from breaking out into loud applause—followed the conclusion of the orator's speech, to which the commanding stature, sonorous voice, and delivery of the speaker lent additional force. Applauded on all sides, confident in the justice of the cause he had pleaded for, on hearing that the sentence would be given late at night Farinacci went home—not to rest, indeed, but to give himself up to one of those nights of dissipation in which this singular and inconsistent man was wont to indulge between his hours of

study and professional work. The dread news reached him there, if we are to trust the old chronicle, that all had been found guilty, and had been sentenced: Lucretia, Beatrice, and Bernard to be beheaded; James to be maced or brained; all were to be torn with red-hot pincers and quartered, and to forfeit their estates to the apostolic treasury.

The only grace granted by the descendant of St Peter was to remit the penalty of being torn by pincers and quartered in the case of Lucretia and Beatrice, and life was granted to Bernard, a boy of twelve, on condition that he should be present on the scaffold during the doing to death of his brother, sister, and second mother. Such were the mercies of the Head of the Church, of the so-called Holy Father.

Lucretia and Beatrice were to be beheaded, though the sole evidence against them was a confession wrung from the former by torture, from the second by the pangs of the rack and cord, or made in the hope of saving her brothers and the Lady Lucretia, of a deed which was done at most in self-defence, certainly to escape shocking ill-usage and constant brutality.

Bernard, with an atrocious mockery of justice, was condemned to assist at the execution of Beatrice and Lucretia and at the butchery of his brother, and to the galleys for life, although a mere child, who, even if he had had a knowledge of the crime beforehand, would have been powerless to prevent it.

James, the last, whose barbarous execution as related with all its ghastly particulars by the powerful pen of Guerrazzi, was residing in Rome at the time of the murder, and, though living in straits, had not been reduced to desperation like Beatrice or Lucretia. He too had confessed under torture, but had recanted later on, and he had been exonerated by the compelled or voluntary confession of Beatrice.

The sentence, however, was not carried out immediately; rumours even had begun to circulate of a reprieve or further commutation of the punishment. Public opinion, such as it was, had been stirred up by the incidents of the trial, and great pity was felt for the accused throughout Rome—especially for Beatrice, whose youth, beauty, and courage had moved all hearts. The Romans might well hesitate before the tide-wave of compassion and indignation which was sweeping over the city, which would subside shortly, but which was very high and threatening at that juncture. While the balance was perhaps wavering for a conditional pardon of one or two of the accused, an event occurred which dulled the edge of the pity of some and awoke fears or doubts in others, and gave the authorities the pretext they wanted; it may really have influenced some. This event was the murder of a noble Roman lady by her son, a kinsman of the Cenci. There could be no pardon for the matricide, whose hand had dealt the blow merely that he might come into his inheritance; but the deed, though differing so essentially from that attributed to the Cenci, resembled it outwardly, and no pains were spared in order to confuse the two deeds. The die was cast. The Governor of Rome received on the 10th of September the warrant for the execution of the sentence.

The 11th of September, which was to be the last day on earth for Beatrice and the two others, dawned in that gorgeous Roman sky which is so frequently to be seen even in midwinter. Beatrice and the Lady Lucretia prepared themselves resignedly and courageously to meet their end.

From the Via Giulia to the Square of St Angelo, where the scaffold had been erected, the condemned had to wend their way slowly through the city. Guarded by soldiers, pikemen, and horsemen, accompanied by hooded forms of the brotherhood of the Misericordia whose duty was to attend and comfort the dying, followed by thousands whom pity or curiosity or both had attracted, they reached the Chapel of St Celsius, where they were to await and be led forth one by one for execution. The two ladies had been joined on the way by James and Bernard, who had been confined in another prison, that of the Torre di Nena. Sister and brother embraced and parted for the last time in the Church of St Celsius; but James was to die last. The Lady Lucretia Cenci was the first to be led out. She displayed constancy and composure in her last moments, only shrinking from the polluting touch of the executioner when he approached to divest her of her veil and mantle or cape; she shrank also from the gaze of the multitude when exposed thus half-dressed, but she never shrank from death. With the pious exclamation, 'O Lord, have pity on my soul, who is coming before Thee for judgment!' she was adjusted, but with difficulty, on the fatal plank. Her last words were, 'This is truly a hard bed to lie on.' Her head fell the instant after, and, according to custom, was held up by the doomsman, who showed it to the people, saying, 'This is the head of the Lady Lucretia Petreni Cenci!'

Beatrice was next led to the scaffold, accompanied by the members of the Misericordia. The executioner accosted her with unwonted reverence, for as she stood there, the fairest maiden in Rome, even he felt reluctant to undo nature's handiwork; and as the people round realised that all that loveliness, and in their opinion all that innocence, was about to perish under the axe, they gave vent to their feelings in sighs and groans, and a rush was made to rescue her; but the ill-concerted attempt was easily baffled. The rescuers were held back by the pikes of the footmen, and charged by the grim horsemen, who rode them down and closed round the scaffold again, where Beatrice was standing still, waiting for the tumult to subside before speaking her few last words to her brother Bernard, whose punishment was to witness the death of all those he loved. She spoke to him gently, and lovingly kissed him, and then turning to the headsman, asked him what she had to do; and being told,

she laid herself in her turn on the plank, and the axe, descending, cut short the life of one who, young in years but old in sorrow, is still remembered by the people of Rome as one of the most tragic figures in her tragic history. According to a popular tradition, the head was not held up by the executioner, but by Beatrice's confessor, who crowned it with a wreath of roses, and, showing it to the people, cried, 'This is the head of Beatrice Cenci, a maiden of Rome.'

The third victim, James Cenci, walked swiftly to his dreadful doom, which, awful as it was, he welcomed as a relief from his unendurable sufferings. Not one particular of the disgusting and cruel sight was spared the younger brother, and Bernard swooned away with horror.

The dismembered remains of James Cenci were buried in the family vault of St Thomas's Church; those of Lucretia were delivered for burial to her brother, who had them inhumed in the family Church of St Gregory. Beatrice's resting-place was St Peter in Montorio on the Janiculum.

The vast estates of the Cenci were declared forfeited to the apostolic exchequer, and for the greater part were eventually bestowed on members of the Aldobrandino family, the blood-relations of Pope Clement VIII. Some were granted to the Borghesi. Partial restitution was made to the destitute orphans of James Cenci—that is, of some entailed freeholds which had been confiscated contrary to law—but only on payment of a considerable sum.

These surviving members of their once proud and princely house long continued to battle for their rights against the rapacity of their plunderers, but with little success. The contest continued for centuries, and the Roman tribunals about the beginning of last century had to pronounce judgment between the Prince Borghese and the Count Bolognetti Cenci.

The guilt of the Cenci has been maintained by some and denied by others in whole or in part. But even those who have admitted the complicity of Beatrice have been compelled to admit also the intolerable maltreatment, insults, and privations to which the unhappy girl was subjected by her brutal and evil father, and also to bear witness to her otherwise blameless life, to her constancy under trials more than mortal, to her intelligence and innate goodness. They base their conviction on what we should call presumptive evidence and on the direct proof furnished by the confession of the accused. But this proof rests entirely on the confession of the accused *under torture*, or, as was asserted in the case of Beatrice, after torture had been employed in vain.

The part James Cenci played is somewhat obscure; his absence from Rocca Petrella would nowise absolutely exclude his moral participation—in other words, his being an accessory before the fact; for, according to the infamous custom then prevalent all over Italy, the nobles were wont to hire ruffians to execute their vengeance, and James would only have been following the general usage had he despatched two or three of these hirelings to stiletto his father. But there is no direct proof of this.

Guido Guerra, the betrothed of Beatrice, who, alone or in conjunction with two others, seems to have been the actual slayer, was the only one who escaped. Warned in time, he succeeded in leaving Rome disguised as a charcoal-seller. He and Beatrice never met again, though it is said that he headed the daring attempt to rescue her as she was being conducted to St Celsius, and that she waved to him her last farewell from the scaffold. He survived many years the death of his betrothed, leading the wandering life now of an outlaw, now of a soldier of fortune, fleeing from his own thoughts, but unable to find the peace of mind which he had lost on that dreadful 9th of September, when by his act, instead of saving, he had destroyed the hapless Beatrice and his own happiness. Wearying at last of broils and bloodshed, he was led by a sudden impulse to join the holy brotherhood of the monks of St Bernard; and in this case the title of holy is fitly given. On these snowy heights Guido lived out the rest of his existence, displaying in saving life the same undaunted courage that he had shown in facing danger as a bandit or a soldier.

The Cenci Palace still frowns vast and gloomy near the banks of the Tiber; but within all is changed and modernised. It is at present divided into flats, which are duly partitioned into small modern rooms in the usual Italian style of the day. But externally it bears much the same aspect as it did of yore. I was informed that some parts of the building have remained intact, but have not been able to verify the fact.

[Since Mr Pignatorre wrote this article in Rome, the main theatre of the tragedy, Mr F. Marion Crawford has published in the *Century Magazine* of January 1908 a paper entitled, 'Beatrice Cenci, the True Story of a Misunderstood Tragedy: with New Documents.' These new documents include two letters by Francesco Cenci, Beatrice's father, and a third letter by her brother Giacomo. Mr Crawford points out what he believes to be of mythical and legendary origin in the story, and establishes the age of Beatrice as exactly twenty-two years and seven months when she died. Shelley's tragedy, he thinks, is largely responsible for the Cenci legends, as the poet drew his information from inaccurate and untruthful sources. The story of Guido Reni's portrait in the Barberini Gallery, Rome, is discredited for many reasons, the chief of which is that the painter did not begin to paint in Rome until nine years after Beatrice's death. Mr Crawford traces the origin of the various mistakes made in Beatrice's story, and concludes thus: 'Divest the story of the Cenci of what has grown upon it, and you have a great love-drama, less noble, but even more human, and surely

far more awful, than the *Bride of Lammermoor*. There is the tragedy of the sins of the father inherited by the children—sins punished by his death and theirs. Upon his soul is the dire horror of knowing that their birthright of evil is from himself; of seeing them do again what he has done, and worse; of feeling from afar off the coming of their vengeance upon him for having brought them into the world to sin and suffer, to slay, and in their turn to die. There is over all his life and theirs the shadow that overhung the Priest of Nemi, the darkness of inevitable doom.']

SPAIN'S GREATEST HUMORIST AND HIS MASTERPIECE.

EARLY in the year 1605 was published at Madrid the first part of *The Ingenious Gentleman Don Quixote of La Mancha*. For the last three hundred years it has been read by people of all nations, and its popularity is amply proved by the fact that, perhaps with the exception of the Bible and *Pilgrim's Progress*, no work has gone through so many editions and been translated into so many languages.

The author of *Don Quixote*, Miguel de Cervantes Saavedra, was born at Alcalá de Henares on St Michael's Day (25th September) 1547. In common with many of the foremost literary Spaniards of his day, Cervantes belonged to a very ancient and distinguished family. In early days an ancestor had adopted as a surname Cervatos, the name of a castle in the possession of his house. On his death he left two sons, the elder appropriating the name; to which the younger objected, and, setting up a new branch of the family, called it after an old castle on the banks of the Tagus at Toledo, San Servantes or Cervantes.

Alcalá, situated on the road from Madrid to Saragossa, was at the time of Cervantes' birth an important university town, very different from the decayed, deserted place which travellers now see; and while residing there the future author would have many opportunities of seeing the numerous books of chivalry which poured from the presses of those days. As he confessed to being a great reader in his youth, one can picture with what eagerness he would devour the tales of romantic and adventurous chivalry which later he so cleverly satirised in *Don Quixote*. The strolling players who visited the town were very probably the cause of arousing his interest in the drama, and up to the very last his great ambition was to be a successful dramatist.

As far as can be ascertained, Cervantes did not receive much education; but, like our Shakespeare, he was a keen observer, and in his works, particularly in the *Don*, he drew very largely from experience, his varied and wonderful adventures furnishing plenty of material for the purpose.

In 1568 he accompanied a mission to Rome, but shortly resigned his post and joined the army, then chiefly engaged in fighting the Turks. He was wounded severely at the battle of Lepanto, and remained for some time in hospital at Messina, but eventually, in September 1575, his brother and he sailed from Naples for Spain, bringing back a letter of recommendation from Don John of Austria to the king. Unfortunately the vessel was attacked by a fleet of pirates and, after a stubborn resistance, captured, and all on board were carried as slaves to Algiers. This town was then notorious as the home of a great number of renegades and scoundrels of the worst description, who made a regular trade of capturing Christians, to be disposed of to the Turks to supply the demand for rowers and dockyard labourers for their great Mediterranean fleet. The prisoners were distributed among the pirates, Cervantes being handed over to one Ali or Dali Mami, a captain of one of the galleys. The brother, Rodrigo, was fortunate in soon being ransomed, and he promised to return to Algiers with a vessel to attempt the rescue of Miguel. In the meantime the latter tried several times to escape, but unsuccessfully. To make matters worse, just as he and some of his fellow-prisoners were being taken off by the vessel sent by Rodrigo, they were suddenly surrounded by Turkish troops, and Cervantes, as leader of the runaways, was brought before the Dey Hassan. Although threatened with torture (and the Algerines were famed for their ingenious cruelty), Cervantes nobly shielded his companions, and took upon himself the whole responsibility for the attempt at escape. His conduct seemed to have impressed the Dey, for the latter purchased him from Dali Mami for five hundred crowns, returning the other prisoners to their respective masters. A letter sent by Cervantes to the Governor of Oran, then a Spanish port, asking for assistance, was intercepted, and the letter-carrier promptly impaled. Miguel was condemned to receive two thousand blows of the stick; but the punishment was, however, not carried out, as some persons interceded on his behalf.

After this he was more closely confined; but still he never despaired, and at last his courage and cheerfulness under such cruel conditions were rewarded, for he was ransomed and set free on the 19th September 1580, after a captivity of five years all but a week.

He arrived in Spain penniless, and finding his old regiment just about to march to Portugal, he rejoined it. He took part in an expedition to the Azores in 1582, and the next year returned to Spain. Having a crippled left hand, he found promotion in the army impossible, and as Don John, his friend and patron, was dead, his prospects were anything but bright. During his captivity he had beguiled the

time by writing poetry, and he now succeeded in getting it published. While this was in the press he married Doña Catalina de Palacios Salazar y Vermediano, a friend of the family and a lady of sufficient means to keep him from actual want, but nothing more. Soon afterwards he was appointed a collector of revenue for the kingdom of Granada; but being robbed of the money he had collected by the merchant to whom he had entrusted it for delivery to the Treasury, and unable to find a sufficient amount to replace it, he was for a short time imprisoned in Seville.

Not long after his release the first part of *Don Quixote* was issued. Very probably it had been in manuscript for some time, as it was referred to by several writers before its actual publication. The work proved such a success that the publisher, who had only retained the rights of publication in one or two districts of Spain, soon took steps to secure the copyright for the remainder of the kingdom. Nine editions of the first part appeared before Cervantes' death, and a tenth shortly after. The nine editions published during his life consisted of about thirty thousand copies. Of the second part four editions were issued before his death, and since then edition after edition of the complete work has been called for. The earliest translations appear to have been made or published in the following order: English—Shelton's, made about 1608, published in 1612; French—Oudin's, appeared about 1616; German—appeared about 1621; Italian—Franciosini's, appeared in 1622. That within such a short period *Don Quixote* should be translated into the four principal languages of Europe shows conclusively the immediate and striking success of the work. The dramatists of the time and the writers of books of chivalry, however, did not relish their works being held up to ridicule; and Lope de Vega, Gongora, and a host of lesser lights vented their indignation upon the book and its author in a torrent of virulent abuse.

It is doubtful whether Cervantes would ever have completed the second part of the *Don* had he not been forestalled by the issue of a spurious second part by a strange hand. The author of this, by name Avellaneda, had in his preface inserted so much personal abuse of the author of the first part, pretending that the reason of the non-appearance of the real second part was due to the failing powers of Cervantes, that the latter was perforce compelled to finish the work, if only to prove the untruthfulness of Avellaneda's sneer.

The two parts differ somewhat in form and substance, the first being almost broad farce, the second consisting of humour more restrained and dignified. For this reason, perhaps, one reader considers the first part superior, while another may prefer the second. Generally speaking, however, the first is much oftener read than the second. Of the work itself it has been well said: 'This, the most cosmopolitan book in the world, is one of the most intensely national. *Manon Lescaut* is not more thoroughly French, *Tom Jones* not more English, *Rob Roy* not more Scotch, than *Don Quixote* is Spanish in character, in ideas, in sentiment, in local colour, in everything.'

Of the thousands of readers of *Don Quixote* at the present time who laugh over his tilting against windmills, or at Sancho Panza's quaintly practical sayings, it is doubtful whether many ever give a thought as to the cause which prompted the writing of the book and the follies which the work so wittily and successfully burlesqued. In England, at any rate, we are indebted to the *Don* for a word which has become part and parcel of our language, and when we use the expression 'quixotic' we are paying a tribute to the genius of Spain's greatest humorous writer.

Of his other works, the best known are the Exemplary Novels; but nothing of his, whether plays or tales, can approach *Don Quixote* in ability, interest, or humour.

Fortunately in his last years his circumstances were greatly improved, for the popularity of his book brought him not only friends but also money, the sale of the work being for that time unusually large. He was in a position to live in what was then the most fashionable quarter of Madrid, and it was in a house in the Calle de Leon that he died on the 23rd April 1616, the day on which (according to the English calendar, which had not yet been reformed) Shakespeare passed away.

What Cervantes was like in appearance is very much guess-work, as the portraits now in existence are not considered by competent authorities to be reliable likenesses. If his work be any guide to his disposition, he may be pictured as one who went through life—a troubled, hard, and painful one—with a joke and a smile; a firm friend to those in distress (to which his companions in exile at Algiers could testify), but a hard hitter and uncompromising foe to men like Avellaneda.

Spain has been blamed for not honouring Cervantes by any statue worthy of the man; but it may fairly be said that he needs none, for the greatest monument to his genius is that which he has left to posterity—*Don Quixote*.

THE HIDDEN WORD.

Listen! Behind that dear contralto of the thrush,
The mystic passion-dream of moon-fed nightingale,
The homely chat of nesting rooks aloft,
And moorland plover's strange, suggestive wail,
There is a voice that has no speech to mix with ours.
The pillared wood with starry primrose floor,
And cloud of misty hyacinthine blue,
These mark the way to shrines where angels guard
the door.
Oh, once to hear with understanding love!
Oh, once to have that door unlocked and look behind!
To see the glory clear, that vaguely now and then
In pearly dawns for briefest space we think we find!

BRIDGE AND ITS PROGRESS.

By F. KINLOCH.

IT is now more than ten years since bridge began to be played in this country. It is generally believed to have come, like the Wise Men, from the East, and Constantinople is vaguely spoken of as its birthplace. It is more probable, however, that the game was evolved at Vienna; for it is certain, to the writer's knowledge, that at least twenty-five years ago the fashionable game in that city was whist, with the dummy hand exposed. From this it is easy to imagine how bridge of the present day came to be thought out.

Bridge made its appearance at a time when all was favourable for the début of a new card-game. Whist, the favourite game in respectable clubs and family circles, had been undergoing a long and painful death at the hands of what were called the American leads and conventions, which sought to raise it to the height—or, if you like, reduce it to the level—of a game of mechanical certainty by an elaborate code of signals. Now, the essence and the charm of a game of cards is that element of luck which, in varied degree of course, always enters into the game. Which makes the bad player at times think he is as good as the good player, and which heightens the enjoyment or intensifies the disgust of every one, good or bad, whether he plays for a stake or for love. Therefore, modern whist, with its endless and ever-changing conventions, by which every card was supposed to be located, was moribund. It bored because it was too much of an intellectual exercise and too little of a recreation.

Thus the ground was all ready for a new card-game, for it is really remarkable how many of mankind, and womankind too, yearn for a card-game of some sort (not necessarily to be played for stakes). Enter bridge. At first it was played tentatively in the more advanced clubs, one table only being allotted to it, and the old whist-stagers vowed that they would have none of the innovation; but soon, very soon, the bridge-tables increased and the whist-tables proportionately diminished in number. Then the fame of the new game spread to society, ever ready to greet a new excitement, and was eagerly taken up. People who had never touched a card before became mad about bridge, some because it was the fashionable thing to do, others because of the gamble. Truth to tell, the stakes that were played when bridge first came in were very much higher all through than are played now, probably because many of those who played had little idea of the intrinsic worth of the game, and regarded it simply as a gambling medium. The gambling players who took the trouble to master its intricacies made a regular income, but these were comparatively few in number; and, curiously enough, many whist-players, even those who had been accounted quite good, took a long time to learn proper bridge. They were, indeed, hide-bound by whist and its conventions, and had, so to speak, to unlearn whist before they learnt bridge, because much of the play (especially that of the second hand) is different when a hand is exposed. The worst of it, for these whist-players, was that they were inclined rather to look down on the new game, and it took them a long time to find out that some of the old whist maxims were inapplicable to bridge.

As we have said, stakes were high as compared with those played now, penny or twopenny points seeming small to those who had been accustomed to think of half-crown or crown points, which were the general club whist points. So, even in the quiet clubs, one never saw a table where halfpenny or farthing points were played, as is generally the case now; while in some of the larger clubs in London, especially among the *jeunesse dorée*, absurdly high points were played. There is a story of an old stager who belonged to one of the senior clubs where play was supposed to be pretty high in the inner circle. While the club was spring or autumn cleaning, the members were admitted *pro tem.* to one of the most fashionable junior clubs. The man in question had been in the habit of playing the highest stakes, and being a good player, valued his play accordingly. He did not, therefore, anticipate

 [*All Rights Reserved.*]

getting a rubber which would satisfy his predatory instincts in the comparatively junior club. However, he made his way to the card-room on chance one evening, and there found three beardless youths waiting for a fourth. They hailed him with joy, for time was beginning to hang heavy. The elder man hesitated at the sight of the boys. 'I may say,' he said, 'that my points are'—so much, naming points which are to our notions very big —'and I do not wish to play for others.' This he said in perfect good faith, in order to keep matters quite straight. To his surprise, one of the youths got up, and, slapping him on the shoulder, said, 'Never mind, old cock; we'll "carry" you.' It should be explained that the term 'carry' means that the partner of the man who does not play as high as the others will make good the difference in the stakes if he loses, or, *vice versâ*, receive the difference if he wins. It turned out that these gilded youths were in the habit of playing three times the points of the older man.

Of course, that kind of thing could not last, and by degrees bridge-players became much more sensible; the points dropped as the gamblers dropped out; the professional bridge-player found that his occupation, or his profit, ceased to exist. And be it said that at one time there were very many of these gentlemen--quite honest players of course. Some of them, who could not afford to play high, were 'run' by a syndicate; that is to say, if a man was a good player but poor in pocket, a private company would be formed to supply him with funds to play in circles where the bridge was bad and the stakes high, and the dividends resulting from the venture were often very good. However, with the elimination of the gambling element and the increasing popularity of the game, points gradually became lower all round, until the game of bridge assumed the present position of being a pleasant recreation to all who care for card-games, with a certainty that wherever they play they can join in a table to suit their means. At most clubs there are two, if not three, gradations of stakes, so it cannot be said nowadays that bridge is in any way a gambling game.

It is, however, from the days when stakes were high that two at least of the bridge conventions or usages date—namely, the 'heart convention' and the 'spade convention.' Previously, it has been said, 'conventions' killed whist, and it is most sincerely to be hoped that conventions will not kill bridge. But a certain number of ordinary conventions are absolutely necessary for a card-game into which skill enters, because players must gain at any rate an elementary knowledge of their partners' hands. Without that, science of any kind disappears. Therefore, by all means let us have the ordinary conventional leads which every beginner must learn by heart, and about which there should be no dispute. But, fortunately perhaps for the game of bridge, the 'heart' and the 'spade' conventions are not universally followed. There are two schools, which is just as well; otherwise bridge would be in danger of suffering the same death as whist. Both the 'heart' and the 'spade' conventions had their origin in the days when play was higher than the purses of the players warranted; but they have both survived to the present day, and have many followers.

To those who are comparatively uninitiated in the game, be it said that the 'heart convention' means that when 'no trumps' are made by the adversaries, and your partner doubles, it is *de rigueur* that you lead him a heart. Now, there is safety in this method, for the mode of attack is clearly defined; in fact, its supporters claim that it constitutes a certainty—though in rare cases it has been known to fail—and, therefore, when men were playing for very high stakes it was reasonable, if not right, to adopt it. On the other hand, those who are opposed to it argue that it cramps the play, and limits all possibilities of the third hand bringing in a long suit unless he have the ace, or king and queen of hearts; indeed, the longer the suit the more certain is it that his hand will be useless. It is said that this 'heart convention' is going out of fashion, though there is a good deal to be said in its favour.

But the 'spade convention,' which also dates back to the days of high points, is, to the writer's mind, of infinitely more importance, whatever the value of the points be. Briefly it is this: If the declarer be dealt a very bad hand he should (except on rare occasions) declare spades in his own hand, and that whether or not he have spades in any quantity. What constitutes a proper original spade-hand is the difficulty, but the general idea seems to be that a hand with nothing but the value of one queen or two knaves (unless there be five meagre hearts) is an 'original spade.' This convention is very universally played now, though it took some time to come by its own. The idea for long was that it was not 'sportsman-like,' and any theory that can stand that criticism and yet emerge triumphant, in this country at any rate, must possess a deal of merit. The writer well remembers a certain occasion when he was upholding the benefit—nay, the necessity—of an original spade declaration. One of his opponents differed very decisively. 'It is,' he said, 'a confession of weakness, and I never hesitate to double; in fact, I may say I always do if I have got anything at all in my hand.' It so happened that almost the next deal there fell to me eight spades to a queen, with the king and queen of clubs. Needless to say, spades were made, the fish rose to the fly, and doubled, and of course was redoubled. I found my partner with one or two good cards, and eventually we made five by tricks in redoubled spades. The man who said he made it a practice to double an original spade had a lesson which, though somewhat unpalatable, he took in very good part.

The chief reason why an original spade declaration is such a useful thing is that it gives the partner so much more confidence on a left declaration. If

seems to say, 'If I leave it I must have something of value in my hand, and you may rely on that, and take it into consideration when making your choice.' Of course there are bitter moments when, after making spades, you find your partner with all the aces, kings, and queens in the pack; but it must be remembered that overwhelming 'no trump' hands are rare—*very rare*. And so it may be said that out of evil came good; from high play, necessitating cautious play, has come a convention of the first importance, and one which adds materially to the interest and the play of the game.

It would be interesting to keep a record of all the curious hands one meets with. The following incidence is worth recording, not only for the actual hands themselves, but for the coincidence which befell. Some three years ago I cut in at a table for the first rubber in the afternoon. The cards—new packs of course—were shuffled and dealt. I happened to be dealer, and on picking up my hand found seven spades with the four top honours, and six clubs to a ten. I left it, with some qualms, to my partner, who shuffled uneasily in his seat, after the manner of some men when they have a difficult declaration to make or card to play. Eventually he said, 'I must make clubs,' and put down seven clubs with four honours and the six remaining spades. We had not a red card between us! That hand was remarkable, but the coincidence was more so. Three years later I cut in at the same table, also the first rubber, and this time our opponents, who had first deal, declared clubs on almost identical hands save that they had one red card between them.

In the old days there used to be a great deal more doubling, especially of spades, than is seen now, and some men were positive nuisances to play with. The following remedy was devised by an ingenious man to give a well-deserved lesson to an inveterate 'spade-doubler.' It so happened that four men, including the 'spade-doubler,' were almost invariably the first to arrive in the card-room, and the proposed victim was generally the last of the lot, so that there was plenty of opportunity to hatch the conspiracy. The deviser of the scheme, being a skilful prestidigitator, so 'cooked' the cards as to contrive that the dealer in the first game of the rubber should have the seven smallest spades, and the rest of his hand should be six clubs to the ace, queen, knave, ten, nine, eight; to the doubler were dealt the six best spades, the ace, king, queen of hearts, the ace, king, queen of diamonds, and the king of clubs single. Of course spades were to be declared, and this was duly done, and then the fun began. It was double, redouble, and redouble until the limit of one hundred per trick was reached. To what they would have been carried had not the rule imposing the limit just been passed by the Portland Club no one can tell. The doubler, who had the lead, swelled with pride as, all unconscious of his coming downfall, he led out his big trumps. Not until his ace of hearts had been ruffed and the king of clubs had fallen to the ace did he realise the trap into which he had been lured. Somehow, he did not seem to enjoy the joke as much as some of the others; but he was more chary after that experience of doubling spades.

Nowadays men are rather inclined to go to the other extreme, and are too timid about doubling spades, for so many have been caught that courage seems to have deserted them. Yet there are opportunities. For instance, if you have, say, four spades to a queen, are good in diamonds and clubs but poor in hearts, and a spade is made by the adversaries on a pass, spades should, if the score allows it, be doubled, for the inference is that your partner is strong in hearts, so that you may assume that, between you, you have all the suits guarded; and yet that is a chance which is often let slip.

Another legacy from the days when bridge was played more as a game of chance than anything else is the practice—a reprehensible one—of not playing spades unless the magical number twenty (why twenty?) has been reached. The ostensible reason for this is that if spades are played the rubber takes a long time to finish; but the real reason may be found in the fact that there is little or no chance of 'getting out' on an undoubted spade-hand. To 'get out' as quickly as possible used to be the aim and object of those who treated bridge as a mere gamble, and so the end of the rubber was sought to be hastened by agreeing not to play spades. This proceeding is a mistake, probably in theory and certainly in practice. It is doubtful whether time is ultimately saved, though there is no hard-and-fast line of comparison by which one may judge of this; but undoubtedly a great deal of play and enjoyment is lost. There is as much play in a spade-hand as in any other, and indeed sometimes more, for often one has to adventure a good deal to arrive at the first milestone on the 'thirty' road. People affect to say that playing spades is dull; but what can be duller than throwing the hands unplayed on the table time after time? The other day I saw nine consecutive spade-hands, seven of which were not played. 'Not playing spades' is a disease which is rather difficult to eradicate once it has thoroughly impregnated a bridge circle; but a firm stand is now being made against it, and the practice is disappearing.

It is very remarkable how the bridge craze has taken hold of ladies. Bridge-parties, which begin early and continue late, are common wherever four enthusiasts can be got together; and be it said that a lady-player who is thoroughly bitten with the game is much keener than the average man. The writer is inclined to think that it is the excitement of the cards more than the enjoyment of the science of the play which appeals to most of the fair sex, even to those who are really good players; and for this reason, that when ladies have their bridge-parties they like to play straight on, rubber after rubber, never 'cutting out.' Now, among men you will

generally find that there is nothing they dislike more than a set rubber of four, and very rightly; for it is difficult, if not impossible, to concentrate one's thoughts on the proper play of the cards for more than three rubbers of the ordinary length without the play becoming mechanical. Directly that happens the real interest is gone; all depends on the luck of the cards, an interest which reduces the game to the level of pitch and toss. Therefore, a rest from the strain of thought is essential.

Bridge is now so popular that it may be safely predicted that unless it is ruined, as whist was, by absurdly attempted conventions, it will stay with us as an innocent amusement for many years. It is a game of skill, and yet the fortune of the cards often tempers the wind to the lamb who would otherwise be shorn; the stakes for which it can be played can be and often are nominal, so as to bring it within the reach of any one who cares for a game of cards; and it is a game which is at once a recreation and an intellectual enjoyment to many after their day's work is done.

A PAWN IN THE GAME.

CHAPTER XXVII.—ON THE WAY TO EGYPT.

THROUGH all these months, Jack, as may be imagined, had watched with ever-deepening amazement the career of his old comrade, the '*Paille au nez*' of schoolboy games and conflicts at Brienne. Was there ever before in human history such a career; a rise so swift, so sure, and to such heights? It was not the steady and ordered rise of a star in the night heavens, but the rush of a comet through space and darkness—Milton's comet, 'with fear of change perplexing monarchs.'

Jack had seen with wondering eyes his old comrade driving, with horses at the gallop, from Paris to take the command of the Army of Italy. On April 12, 1796, the opening battle against the Austrians at Montenotte was fought; a month afterwards came the fight at the bridge at Lodi, where Bonaparte won the nickname of 'the Little Corporal,' and became visible to all France. On February 12, 1797, came the capitulation of Marshal Wurmser and the final defeat of Austria. The campaign lasted ten months, and saw the overthrow of an empire.

In this campaign Bonaparte's battles were, perhaps, the least wonderful part of the amazing story. He learned to talk with the accents of a Cæsar. He made war and peace, set up republics, annexed provinces, overthrew kingdoms; kindled a revolution in some historic Italian state with a whisper, or suppressed it with a gesture.

A year after the capitulation of Wurmser, Bonaparte set sail from Toulon on some great and mysterious adventure in the East. The proudest fleet that ever left a French port carried an army afloat, the men that had overrun Italy and broken the strength of Austria, the most terrible fighting force in the world. For a time Europe could not guess towards what goal that mighty expedition was sailing. Then followed the wonders of the Egyptian campaign.

A career that in a space so brief had reached a height so dazzling might well be thought to have exhausted the gifts of fortune. No one could foresee the still greater events to follow. In August 1799 Bonaparte returned a semi-fugitive from Egypt. His fleet had been destroyed in Aboukir Bay; he had left the flower of his soldiers outside the shattered walls of Acre. But in less than three months he became the First Consul. The imperial crown was at his feet.

To step in a few weeks from a tent in Egypt to St Cloud, this—measured by the test of the almanac—is a history without parallel. The mere dates at this part of Bonaparte's career are an incredible romance. At the end of 1795 he is an artillery officer, with an arrested career, fretting with discontent in Paris. The Italian campaign takes a single year. The adventure in Egypt takes another year. Then come three months of obscure plotting in Paris—and the First Consulship!

The wondering interest with which Jack followed this chain of dazzling events can be guessed, and the story interpreted his old comrade to him. The pride, the majestic self-confidence, the assurance of a 'destiny' which always characterised his schoolmate, when embodied in a little, spindle-shanked, unknown artillery officer, were no doubt matter for laughter; but now '*Paille au nez*' became intelligible. Bonaparte's face and character were ciphers to which these tremendous events were the key.

That fretting discontent, that assurance of a beckoning destiny—what was all this but the self-consciousness of genius? Seen through drifting battle-smoke, that falcon-like face had quite a new significance. The challenging eyes, that aroused the noisy scorn of the cadets at Brienne, Jack felt were fit to look at kings with equal gaze. Yet still he knew there was in the character of his old comrade that fatal taint of ice-cold selfishness, that fundamental want of steady moral principle, that sooner or later must bring disaster.

Bonaparte, however, was still in Egypt fighting Arabs, storming ancient cities, and dreaming wild, unconfessed dreams of conquest—dreams that would have shaken half the thrones of Europe with alarm had they been known—when Jack Lawrence sailed in the *Sylph* for Egypt.

Ill-fate assigned to him perhaps the most crazy

ship at that moment in the employ of the British Admiralty. The absurdly named *Sylph* was a transport, ill-found, unseaworthy, foul with barnacles without, and fouler still with rats and vermin within. She sailed from the Downs in February, the month of wild winds, and was whipped with storms across the Bay of Biscay, past the coast of Spain, and through the whole length of the Mediterranean.

Jack, fortunately, had steady nerves and a sea-going stomach, or the experience might well have killed him. For three days the leaky transport hovered off Malta trying in vain to make that port, a tremendous sea breaking over her all the time. The attempt to reach Malta was abandoned, and the *Sylph*, with torn canvas and shattered bulwarks, went wallowing through the wild seas eastward. The captain was a rugged old salt, in whom a sort of sea-instinct or such unconscious and inherited faculty as a sea-bird possesses took the place of any scientific knowledge of navigation; and against the buffeting of sea and wind he armed himself with perpetual doses of rum till his whole body seemed drink-sodden.

The only consolation Jack had was the company of the second mate, named Grant, a seaman of the finest type, with a courage whose serenity no danger shook, and a smiling philosophy whose cheerfulness no hardship quenched. The sight of his wind-beaten but cheerful face, the sound of his unfailing laughter, was a perpetual tonic. Some inner and exhaustless fountain of mirth made him, on the deck of that storm-whipped ship, a bit of embodied sunshine.

Jack asked him one day as they stood under the break of the poop, while the green waves broke in a cataract of foam over the labouring ship's battered nose, what was their exact situation.

'The old man,' said Grant with a laugh, as though it were an exquisite jest, 'doesn't know. The only observation he has taken for the last week is through the bottom of a rum-bottle. Never mind, sir,' he added, as Jack's face grew grave at his words; 'it is all a sea-experience. We shall come through all right.'

But the next morning land was seen dimly through the drifting gusts of rain on the starboard bow. The captain pronounced it to be Rhodes. Towards evening land was discovered on the other bow too, and the astonished captain frankly declared he did not know where he was. Rhodes was on one side of their ship or the other, but on which, he declared with an oath, nobody could tell. Grant was still able to see the humorous side of the situation.

'The old man,' he told Lawrence, 'can often see two bottles of rum when only one is on the table, and cannot make up his mind which to take; and now he is not sure whether he really sees two capes when only one exists. But the capes are there right enough,' added Grant, with a new laugh, 'and we must claw past them both as best we can.'

All that wild night the ship lay to, labouring heavily. The next day at noon Grant took an observation, and was able to persuade the old man that they were at the entrance of the Gulf of Satalieh, and that to run on was to be lost. The leaky old transport, by some miracle of good luck, rounded the cape to starboard, and went ploughing its slow course eastward towards the coast of Syria, where it was to join Sidney Smith's squadron outside Acre.

On the fifth night after passing Rhodes Jack had turned in, weary of balancing himself on the wave-swept deck or of trying to read in the reeling cabin. Towards morning he was awakened by a tremendous shock, a crash that seemed to shake the old transport in every timber. Then came the tramp of hurrying feet overhead, the wild cries of the seamen, the roar of breaking seas. Jack had lain down half-dressed. He was hurriedly slipping on his coat, when he heard the sound of running feet outside his cabin. The door of his bunk opened, and Grant put in his head, with cheerfulness still visible in every line of his sea-wet visage.

'The old man has run us ashore, and the ship may break up any minute. Come on deck;' and with a pleasant nod as though he had just communicated some ordinary bit of intelligence, Grant vanished.

Jack strapped his despatches round his waist and hurried on deck. It was the darkest hour before daybreak; the sea was like ink under the black skies. But as he looked aft he could see, high in the air above the stern, a faint, uncertain, but swiftly travelling edge of grayish white. It was the crest of a great wave riding in on the ship. It broke and swept past him, as he clung to a ringbolt, a tumult of sound and foam. He heard the crash of broken spars and torn bulwarks as the rushing hill of water tore its way along the whole length of the ship; and above other sounds could be heard one still more dreadful—the cry of drowning men swept away in the gloom.

Fortunately the break of the poop still sheltered the spot where Jack stood, or a dozen times through the hour that followed he would have been carried away by the furious seas. Presently through the darkness he saw a figure struggling up the slanting deck to where he stood. It was Grant.

'The old man has gone with most of the crew, and unless the sea quietens the *Sylph* will soon be churned into chips.'

Their faces were close together, and Jack caught a gleam of the mate's white teeth. The reckless sailor could smile when telling tidings such as these as if he discerned a flavour of humour in them, and Jack felt the gloom and horror of the scene grow a little lighter from the contagion of Grant's courage.

'Can nothing be done?' he asked in a momentary quiet of the rushing waters.

'Nothing, except to hold on. The *Sylph* is an

old tub, but she has something of the solidity of a tub, and may hold together till the sea goes down. God is merciful,' he added cheerfully, 'and that is our hope.'

'Yes, Grant, this is the time to remember the mercy of God. But we oughtn't to wait till a time like this to remember it.'

'And do you think,' asked Grant in wondering tones, 'that a good seaman ever forgets the mercy of God? Living on God's sea, how can a man forget its Maker?'

And Jack felt rebuked by the note of astonishment in his voice.

Morning at last came, as it will come after the longest and darkest night; and with the breaking day the sea commenced to go down. Presently the two bedraggled figures, stiff and sore with the buffeting of the last three hours, were able to creep from their shelter under the break of the poop and look about them. The ship was fast; her masts had gone by the board; her bulwarks were a fringe of splinters; her bows were stove in. Evidently they were the only survivors. The black skies, the hurrying clouds, the empty, desolate horizon, the measureless stretch of leaping waves, the dim contour of the land (low and gray and half-obscured with drifting scud), all this made a scene enough to chill even a brave man's courage.

The shore was visible at a distance of about a quarter of a mile. The sandy beach was a tumult of racing foam; the low cliffs beyond were treeless, and showed no sign of human habitation. Grant had climbed up the sloping deck and was looking keenly to windward.

'No sail is in sight,' he said, 'and no sail could help us while this sea lasts. But the clouds are lifting, and before noon we shall see the sun. But the old craft shows signs of breaking in two amidships, and we may yet have to take our chance of riding ashore on a spar;' and he smiled cheerfully at the prospect, as though it were an ordinary, and on the whole not an unamusing, incident in a sailor's experience.

(To be continued.)

WALVISCH BAY.

By Rev. M. T. HAINSSELIN, R.N.

AN isolated little tract of British territory, barely seven hundred square miles in area, a mere bite on the edge of a large German slice of bread-and-butter—this is Walvisch Bay, on the south-west coast of Africa.

'The Earth'—so our first geography-book taught us—'is composed of land and water.' Substitute *sand* for *land*, and you have a perfect description of Walvisch Bay. It is an oblong patch, than which the Sahara Desert itself could not be sandier, indented on one side by a deep circular bay.

It is a simple matter to deal in gazetteer fashion with this little territory—as thus: productions *nil;* exports and imports *nil;* population *nil*, or very nearly. The great ocean liners do not stop there, even the lesser steamers as a rule disdain it, and its only communication with the outside world is by means of a small German boat once a fortnight. It is not a favourite tourist locality, and the average man who comes out to South Africa for a couple of months, and then writes a book about the country, probably never even hears the name of Walvisch Bay mentioned. Yet it is an extremely valuable and important possession, and one which there is every likelihood of our holding fast.

It may not be generally known that the vast German territory of Damaraland which surrounds Walvisch Bay was at one time held, more or less loosely, by ourselves, and even administered by our magistrates and officials. But in those days the possession of colonies—especially of South African colonies—was looked upon as rather a nuisance, and there was little desire to add to our burdensome responsibilities. Consequently, in 1884, the whole country was allowed to fall into the hands of the more far-seeing Germans. We did make, it is true, some sort of diplomatic struggle to retain it, awaking too late to the proper estimation of what we were letting slip; but it was only a half-awakening after all, and the struggle was as half-hearted as it was brief.

Nevertheless, we were not so totally short-sighted as to give up Walvisch Bay, the one spot where we had maintained a permanent station. Damaraland we gave up, a country well suited in the interior for grazing and agriculture, and enjoying a climate agreeing well with Europeans; Walvisch Bay, a barren tract, we retained. But it is the only harbour on the whole coast, the natural outlet of the vast hinterland. What Delagoa Bay is to the Transvaal, that Walvisch Bay is to Damaraland, the sole port of the country, a most desirable possession in the hands of an alien power.

Not even the dullest of politicians could fail to see the advantage of retaining such a spot, though it is difficult at this date to say what was the precise motive for so doing. Possibly there was the idea of securing the Customs dues of the country at the natural point of entry for all internal trade. Or it may have been that we wished to hold goods which we might exchange at some time with some other German possession; although one who ought to know has said that there is not a single square mile of German territory on the face of the globe which Great Britain covets or would have as a gift. Reasons such as these could only have been based upon the doubtful

events of the future; much more to the point, as a reason for our retention of Walvisch Bay, is the fact that it would become a danger to ourselves if it became German property. Developed into a naval base, as it might easily be, with docks, stores, and the other appurtenances of naval warfare, it would be a constant menace to our West and South African colonies in the event of war. We hold it, therefore, not because it is of any use to ourselves, but because of the use which might otherwise be made of it against us. The only practical use to which we put the harbour is that of making it the headquarters for the heavy gun practice-firing of the ships of the Cape Squadron. For this it is admirably adapted. The harbour is formed by a long sand-spit which runs northwards for about five miles; behind this the mainland is scooped out into an almost circular basin some twenty square miles in extent, where the water is calm and the anchorage good.

A few miles to the north a tiny river forms the boundary-line between British and German territory; and here the Germans have built the little town of Swakopmund, which they use as a make-shift port for their country. There is absolutely no shelter, except for the smallest vessels, from the huge Atlantic rollers, and a steamer recently took forty days in unloading her cargo there. From Walvisch to Swakopmund there runs—or used to run—a light railway, built by some enterprising and trustful person who hoped that our neighbours would make use of the British harbour for importing and exporting their goods. It would have been a most convenient arrangement; ships could have lain in Walvisch Bay in perfect security, and worked cargo in peace. A long pier was built out, with the railway lines laid to its very end, to facilitate such work. The Customs duties would have made a little revenue for the British settlement, and both countries would have been mutually convenienced. Unfortunately, however, the Germans preferred their own harbour, poor though it might be, to ours. And so the railway has fallen into a miserable decay. At some places the sand-drifts have raised their yellow hills to a height of twenty feet above it; at others the sand has fallen away and left yawning chasms beneath the line, where sleepers and rails, all rotten with rust and corroded with sand and salt, sag downwards and break with their own weight.

I walked for a few miles along this line. No view could more completely present the idea of desolation and decay. On all sides nothing can be seen for miles except a waste of sand, sometimes in flat stretches, more often in heaped-up dunes whose almost perpendicular sides had been exquisitely carved by the wind into the semblance of fortresses, with long walls, rounded bastions, and escarpments, all of the same monotonous dull yellow. The line of the railway is marked out on both sides by thousands of empty gin-bottles, the trade-mark of the West Coast, thrown aside by the natives after their abominable and poisonous contents had been consumed.

There are but few signs of animate creation. Chief amongst these few are the flamingoes, which line the shores of the bay in countless flocks. So numerous are they that, from the deck of a ship three or four miles away, the pink markings of their wings make a distinct line in the centre of the thicker line of white. There are a good many eider-duck, also solan geese or gannets. These fly around at a great height, 'quartering' the sea as a hawk does the land. Every now and then the gannet falls on his prey, not swooping as most gulls do, but dropping straight as a plummet, with tremendous speed and force. He disappears beneath the water for several seconds, but when he comes up again he is seldom without his prey.

The waters of the bay are frequented by a large claret-coloured jelly-fish, with streamers over a yard in length. Nowhere else have I ever seen these creatures in such vast numbers. They swarm in myriads, like a solid mass, and often one cannot see the water between them, so densely are they packed. Fragile as they are, in such numbers as these they are sufficient to check the way of a boat. Presumably the sea-floor of the bay must be covered with the remains of these beautiful but noxious creatures; for when a ship's anchor is weighed the mud which is brought to the surface has a most loathsome stench of corruption which is 'seldom equalled and never excelled.'

The settlement lies close to the landing-place, and consists of some half-score buildings, including the magistrate's and doctor's houses, the police-barracks, a couple of stores, and a small wooden church with an adjoining manse occupied by a missionary whose work lies chiefly amongst the natives. The European population amounts to about thirty, children included. With admirable enterprise, golf-links have been laid out on the sand, and there are a couple of tennis-courts. These recreations, with an occasional gallop along the beach, comprise the sum-total of the attractions of this seaside resort.

Some three miles to the rear of the settlement there is a straggling collection of squalid native huts dignified by the name of Sandfontein. Having heard of this place, I was anxious to see it, and made my way across the undulating sands till I came upon a few outlying huts. I asked if this were the village. 'This is *Little* Sandfontein,' was the reply; '*Great* Sandfontein lies over there'!

The natives are a mixed race, chiefly Hottentots of the lowest type, with a few Hereros amongst them. Some of them, however, possess a certain amount of education. Outside one filthy hut I saw a native woman squatting upon the ground and rubbing with gentle hand a little brown child who looked sickly and ill. Thinking, in the usual English manner, to adapt my language to the under-

standing of my hearer, I inquired, 'What de matter wid de pickaninny?' Great was my surprise to receive the answer, spoken in excellent English, with a perfect accent, 'She complains of pain in her stomach, sir.'

At the close of the recent German war with the natives, a good many Herero refugees made their way to Walvisch Bay, and it was noticeable that most of them were clothed in German uniforms.

No account of any place can be considered complete, from an Englishman's point of view at any rate, without some remarks concerning the weather. At Walvisch Bay, though well within the tropics, it is so cool that for the greater part of the year a fire is very welcome. Frequently the whole view is obscured by a dense white fog which chills one to the very marrow and deadens every sound. There is one good point about it, however: it drops for a while a kindly curtain over the relentless vista of everlasting and ubiquitous sand.

THE DUC D'ENGHIEN'S LOVE-STORY.

By M. Betham-Edwards.

I.

STRANGE links with the past will occasionally attract the literary *flâneur*. None surely were ever stranger than the following.

In his memoirs, Henri Rochefort, 'the stormy petrel of French politics,' who still lives and edits his once famous paper, mentions having as a child visited the Duchesse d'Enghien. For true it is, although the fact has been contested, that the last of the Condés left a widow, and to this widow her youthful relation, Victor-Henri, Comte de Luçay-Rochefort, was presented by his father, the Marquis, before his eighth year—that is to say, between 1833 and 1841, dates of his own birth and of the Duchess's death.

There can surely be few men or women living who have had a similar experience, and who have come in direct contact with personages of the *ancien régime!* That aged, grief-stricken lady in widow's weeds was the once vivacious, captivating Charlotte, Princess de Rochefort-Rohan, favourite companion of Marie Antoinette in her halcyon days, and niece and goddaughter of her evil genius, Cardinal Louis de Rohan, of the Diamond Necklace. Who can say? Perhaps the story of the Duchesse d'Enghien may have had something to do with her kinsman's implacable hatred of Imperialism, a hatred in no small degree contributing to its downfall. To her dying day Charlotte never forgave her husband's assassin. Gentlest of the gentle, devotee of devotees, her forgivingness could not go so far.

Blackest deed in the black Napoleonic annals, the crime of Vincennes has been recounted again and again. Less familiar is the sordid history of the *émigrés* and of Condé's army so called, a band of desperate men living upon the charity of their country's foes, one and all sworn to restore feudalism and the *ancien régime*. And wholly unknown to English readers is doubtless the one redeeming feature of the Coblentz campaign. No more pathetic love-story ever relieved blood-stained and dissolute chronicles than that I am about to relate.

Roy ne puis, duc ne daigne, Rohan suis, was the proud motto of the Rohan house, allied by marriage with royal blood. It was in 1762 that the beautiful Charlotte Gottfriede de Rohan-Soubise was married to a grandson of the hero of Rocroy; and just as her great-aunt had been fallen in love with at first sight by a Condé, so the first meeting of Charlotte de Rohan-Rochefort and Louis de Bourbon, Duc d'Enghien, seems to have decided their future existences as far as passion was concerned.

Girlhood in France of the *ancien régime*, as at the present time, played no part in domestic life. Until she became marriageable, the daughter of a princely or noble house remained as entirely a recluse as if shut up in a Turkish harem.

In the fashionable convent of Panthemont, Rue de Bellechasse, Paris, with others of the same rank, Charlotte had held her state, having a maid of honour, several attendants, and a daily cover at the abbess's table. From masters she took lessons in music, dancing, and other accomplishments of the day; but the school was essentially one of devotion and manners. The traditions of St Cyr and Madame de Maintenon were strictly kept up. First and foremost, the young ladies were made devout Catholics. Next they were formed for playing their part in society. No recluse or ascetic was the lady abbess; and at her hospitable board Charlotte early acquired the arts of conversation, deportment, and also worldly wisdom—*savoir faire*, as it is called in France.

On her education, or what passed for such, being completed, in her eighteenth year she took her place in the sumptuous family *hôtel*, aiding her mother with the honours of her *salon*, and joining the coterie of the unfortunate Princess Elizabeth, her junior by three years.

The youthful hostess of the Hôtel or rather Palais Rohan had inherited neither her mother's great beauty nor her brilliant social qualities, but those even more endearing—a rare winningness of character, and a depth of feeling proof against time, change, and bitterest ordeal. With Thekla she could have summed up her life in the sentence,

'*Ich habe gelebt und geliebt*' ('I have lived and loved'). She also could have penned Mademoiselle de l'Espinasse's famous line to her lover: '*Chaque instant de ma vie je vous aime, et je vous attend*' ('Every moment of my life I love you, and wait for you').

Rather Schiller's heroine her portrait suggests than D'Alembert's Egeria and the writer of perhaps the most impassioned love-letters ever penned. Almost Madonna-like in its suavity and pensiveness is the fair face set off, as fashion ordained, with long elaborate curls. For a brief—a very brief—space, however, her existence was radiant.

What a change from convent routine to the gaieties of a court and the attractions of a much-frequented *salon!* In her memoirs Madame Vigée Le Brun describes the *réunions* of the Hôtel Rohan: half-a-score of intimate friends, chosen for their amiability and sprightliness, sitting down to a late supper, Charlotte aiding her mother in doing the honours. The grace, affectionateness, and vivacity of the young hostess added a new attraction. Charlotte, moreover, was an heiress; her marriage naturally occupied many minds; suitors more or less desirable solicited her hand. Among these was a certain possible heir to the throne of Poland; but Charlotte's pretty head was not turned by the somewhat chimerical prospect of a crown. Paris, her mother, her friends, were not so lightly to be parted with. The possible heir to a northern kingdom was rejected, and a little, yet a little longer daily life answered to girlish dreams.

II.

THE storm broke with cataclysmal suddenness and fury. In less than three days after the fall of the Bastille the unfortunate Louis and Marie Antoinette found themselves abandoned alike by kinsfolk, friends, and the favourites who had been covered by them with wealth and honours. Never in the history of civilised nations was displayed such poltroonery and animal-like sense of self-preservation. The disgraceful stampede was led by the king's brothers; and on the 17th of July two carriages, stripped of their armorials, started post-haste for the eastern frontier, the inmates being the three Condés, its unworthy head called Monsieur le Prince; his son, the no more respectable Duc de Bourbon; and his youthful grandson, Louis, Duc d'Enghien. So overwhelming was the prevailing terror that Condé's daughter, the austere Princess Louise, afterwards Sister Marie-Joseph de la Miséricorde, accepted as travelling companion her father's mistress! Both vehicles were crowded to suffocation, ten persons occupying the room designed for eight. In torrid heat and desperate scurry the fugitives rattled several hundred miles, reaching Turin by way of Belgium, the Rhine, and Switzerland. A few months later the Rohan-Rochefort family joined the *émigrés* at Worms, for the time being Condé's military headquarters, those of the king's brothers being at Coblentz.

Charlotte de Rohan was now twenty-five, and, as might be expected from her bringing-up and surroundings, she had become a warm partisan of the royalist cause. Her cousin and junior by several years, whom she had only once seen as a boy, entered no less ardently into his chief's campaign. Animated with the spirit of his great ancestor the victor of Rocroy, the young soldier seems, indeed, almost a heroic figure among his unheroic *entourage*.

Personally, Louis de Bourbon had not been particularly favoured of nature. By one who knew him he is described as being below ordinary stature, but well made, extremely agile in his movements, and of taking appearance; also, in those early days, given to questionable adventure. But he was a dashing cavalier, he shared Charlotte's dynastic enthusiasm, and he represented a house next to that of France. Daily intercourse and constantly evoked sympathies developed an intimacy that, sisterly, brotherly, in the first instance, soon ripened into tenderest affection, ultimately deepening into a passion that dominated every other feeling. If ever two beings proved each other's destiny it was these two.

The history of Condé's ill-fated and ill-judged little army is an odyssey only touched upon here when necessary. The part played in the miserable story certainly redounded to the Duc d'Enghien's credit. Napoleon, with his appreciation of military qualities, may not unreasonably have learned to regard him with suspicion. If the young man showed the foibles of Condé's unworthy descendants, he also gave proof of redeeming qualities. On the march, in the skirmish or battlefield, he displayed not only courage but initiative, and, what at one time was rarer, consideration for those serving under him. When no fighting was going on he hunted, danced, rioted, and flirted with the rest. Not yet had his affection for Charlotte de Rohan developed into passionate love.

Meantime another figure claimed the girl's care and devotion.

A year before the fall of the Bastille the Cardinal de Rohan had been permitted to return to Paris. The affair of the Diamond Necklace seemed forgotten. An *émigré*, like his kinsfolk and friends, he betook himself to one of his numerous seigneurial residences, a small principality on the right bank of the Rhine over against Strasburg. The place was called Ettenheim, a name of itself enough to stamp Napoleon's memory with undying infamy. To the society-loving Cardinal this second exile appeared less bearable than the first. Formerly he had at least breathed native air; he was now cut off from French surroundings and French speech. In his discomfiture he thought of his favourite niece and god-daughter, the winning young hostess of the Hôtel de Rohan. Would she share his exile and cheer his solitude?

Meantime Charlotte's family was scattered—not

only leagues dividing the separate members, but opinions. Whilst the Prince, her father, with one of her brothers, had joined Condé's headquarters at Worms, the Princess and her elder children had remained in France. Strange to say, mother and sons were in sympathy with the changing order of things; and as a camp—such a camp at least as that of Worms—was hardly the place for a young lady fastidiously reared as had been Charlotte, we next hear of her under the Cardinal's roof. There she passed the terrible years that followed, her heart ever with her hero in the camp. Every testimony to the young Duke's ardour and what in her eyes constituted the sublimest patriotism but deepened growing passion, and in 1794 the pair were thrown together under romantic circumstances.

The rout of Condé's little army in Alsace, the fatigues of the recent campaign, and the discouragement of irretrievable disaster told upon the Duc d'Enghien's not too robust constitution. In January 1794 he fell dangerously ill, and was nursed by Charlotte at Ettenheim, the hospitable Cardinal apparently opening his doors to any of his friends or relations needing 'harbour and good company.' For months this idyl of convalescence lasted. As soon as the weather permitted, leaning on Charlotte's arm, her patient breathed the springtide air, their talks of France and Fleur de Lis, of all that was lost and all that they hoped to regain, of tragic events in Paris and projected reprisals, alternating with lighter, more personal themes. They were now lovers.

And who can say? Ardent royalist as was Charlotte, much as she gloried in her young soldier's ardour, perhaps for a brief space she now caressed dreams of union and fireside happiness. Might not the Duke prefer inaction to serving under foreign leadership? Might not altered prospects weigh with the proud head of the Condés? Well enough the lovers knew that hitherto nothing but a royal alliance would have been considered for a moment. The great-grandson of the victor of Rocroy must wed some princess of a reigning house.

'Le Roi' an exile, the little army of his followers scattered, the Courts of Europe holding aloof, alike royal and ducal coffers empty—surely such lofty ambitions had received a check?

Whatever may have been Charlotte's hopes, she never allowed them to overcome impersonal interests. In her counsels the Duke had always an Egeria. To his father he wrote of her during convalescence: 'When honour calls me, there is one here who, instead of hindering, will hasten my departure.'

What seemed the call of honour came. A little later the lovers parted after tenderest adieus, Charlotte receiving daily letters from her hero, now commanding the *avant-garde* of the little royalist army in Würtemberg. To the young soldier's capacity and daring in this brief campaign even his enemies paid homage. But again and again came crushing disaster and heart-chilling delays.

And again and again comfort and uplifting reached him from her to whom, despite his foibles, he ever remained faithful and a hero. As has been said, the Duc d'Enghien had inherited the errors as well as the courage of his race. If indeed a *preux chevalier*, it cannot be said of him that he was a *chevalier sans reproche*.

III.

TEN years passed, each in its course more completely falsifying the hopes of the royalist party. The *ancien régime* had not been restored by foreign arms. Napoleon, First Consul, had his heel on the neck of France. The proclamation of an autocracy was at hand.

Nothing more clearly reveals the Bourbon character than this story. No longer venturing to call himself Comte de Provence, an exile bearing an assumed name, now accepting a pittance and shelter from one sovereign, now from another, the brother of Louis XVI. had not been one whit changed by recent events. Nor had altered prospects in the very least modified the haughtiness of the Condés. Neither Monsieur le Prince nor the Duc de Bourbon abated a tittle of his former pretensions.

Within this space the familiar world had been turned upside-down. The order of things must undergo another and still more vital transformation ere 'Le Roi,' so called, would permit a Condé and a Bourbon to wed with any not of royal blood.

Royal and parental authority in the case of alliances, as we know, was absolute. During the reign of Louis XIV. a nobleman had sent his son to the galleys for having married out of his rank. The obtaining of a *lettre de cachet* in such cases was no unusual event until the Revolution—witness Mirabeau's story.

Tentatively, again and again the Duc d'Enghien approached his father on the subject of his marriage. Not venturing upon an open declaration, not even suggesting a marriage with Charlotte de Rohan, he seems to have hoped against hope that his wishes would be anticipated, that at last fireside joy should compensate him for bitterest disillusion.

On the other hand, the elder Condés were hoping against hope that an alliance of their grandson with some royal house would in some measure restore family fortunes and prestige. In 1802 we find the Duc d'Enghien writing to his father thus: 'My grandfather tells me that he and you are both trying to better my circumstances. I presume it is of my marriage that he speaks; but I am surprised that in a matter so nearly concerning myself I should be kept in the dark. I have long ceased to be a minor. Consequently we should be at one on a subject which I consider the most important in my life, and on which I should come to no hasty decision.'*

* 8 Avril 1802. Archives Nationales.

Quite suddenly the lovers' hopes were raised. By the death of the Cardinal de Rohan, his god-daughter, favourite niece, and devoted companion became an heiress. Might not such accession of wealth weigh with Monsieur le Prince or the Duc de Bourbon? Financially speaking, the house of Condé, with that of their royal master, was in direst straits. Alike royal and ducal coffers were empty, without any prospect of replenishment; one after another protégés on European thrones tightened their purse-strings; the Continent, indeed, had grown sick to death of the word *émigré*. Only with the utmost and reiterated insistence could the Comte de Lille—or 'Le Roi,' as he was called by his friends—extort a miserable little subsidy wherewith to keep up the semblance of a Court. Whether at this juncture the Duc d'Enghien boldly and fruitlessly demanded permission to marry Charlotte de Rohan we do not learn. The desperate decision arrived at a little later would seem to point to such a conclusion.

In the last days of 1803, and in the presence of two witnesses, the lovers were secretly married, the ceremony being performed by a late vicar-general of Strasburg Cathedral. Henceforth life to these two meant home only, mutually shared joy in common things. And with that blindness of human nature which the Greek dramatists regarded as fatality, bride and bridegroom chose to settle themselves within a stone's-throw of the French frontier. At a time when rumours of conspiracy had maddened Napoleon—when drum-head courts-martial were the order of the day, when any one bearing the name of Bourbon was forbidden to touch native soil on pain of instant death—scoffing at threats, rebutting persuasions, blind to dangers, the Duc d'Enghien coolly took up his residence at Ettenheim.

In a modest château the pair now made their home, busying themselves with the cultivation of flowers and vegetables, amid such occupations forgetting past illusions and gloomy forebodings. As has been said, this long love-story had not been without many a shadow. Charlotte's devotion could forgive lapses that might have proved unpardonable to many women. They were at last united, all that now seemed left to them being their love for each other.

IV.

ON the heels of honeymoon came dire tragedy. The frenzied haste, precipitation, and brutality with which Napoleon's orders were carried out look like insanity.

On the 15th of March 1804—that is to say, about three months after his secret marriage—the Duke was carried off by a strong armed escort, such violation of territory heightening the barbarity of the deed. From the citadel of Strasburg, in which he was lodged, the prisoner wrote a long letter to Charlotte, concluding thus: 'You know my long and tender attachment to you. Free or a prisoner, that attachment will never change.' And he adds: 'The faithful Mohiloff has never quitted me for an instant.' Mohiloff was the Princess Charlotte's dog, who had followed the military convoy to the Rhine. Not being permitted to enter the ferry-boat, he swam to the other bank, and jumped into the carriage, there lying at his master's feet, and showing his teeth at attempted interference.

This long and tenderly passionate letter, breathing hope and encouragement, naturally never reached its destination. With other papers it was straightway handed to Napoleon by the General in charge, named Leval.

Without for a moment dreaming of the fate in store for him, and never losing his self-control, the prisoner kept up his old habit of writing a diary. Here is his last entry: '*Sunday, March* 18.—I was taken away [from Strasburg] this night at half-past one. Only just time was given me to dress. I took leave of my unfortunate friends and servants and set forth alone, under guard of two officers and two gendarmes. I was told by Colonel Charlot that I was being taken before the General of Division, who had just received orders from Paris. Instead, I find a carriage with six post-horses before the Cathedral. I am bundled inside. Lieutenant Petermanns placed himself beside me, and an officer of the gendarmerie named Blitterdorf drove. Two gendarmes accompanied us—one inside, one out.'

The crime of the Iron Mask was not carried out with more secrecy than Napoleon's crowning infamy. At express speed and with frequent relays the *berline* rattled toward Paris. Along the route were posted soldiery, so fearful was the tyrant of losing his prey—a young man whose only crime was his name! And such was the precipitancy enjoined on his agents that no time was allowed for a meal. When, after sixty-two hours' incessant travel, the Duke and his faithful dog reached Vincennes, they were half-famished. A humble official, moved to pity by their appearance, hastened to the nearest restaurant, and set before the pair a bowl of vermicelli soup and a *fricandeau*, which were gratefully devoured. The name of this humane gendarme was Aufort, and in 1816 he published an account of what happened.

The following order had been forwarded that morning to Harel, governor of Vincennes:* 'An individual, whose name is not to be known, citizen commandant, will be conducted to the fortress under your charge. You will place him in a vacant cell, and take proper precautions for his security. The intention of the Government is that everything concerning him is to be kept a profound secret, and that no questions are to be asked as to the reason of his detention. You yourself are not to know who he is. You alone will communicate with him; no one else is to see him till the receipt of further

* Archives Nationales, where it can be seen (folio 6418, 29 Ventose An xii., Police Secrète).

orders. He will probably arrive this night. The First Consul, citizen commandant, relies upon your discretion and the exactitude with which these orders are carried out.'

Meantime the members of the impending court-martial were already assembled in close proximity to the prisoner, their instructions being to condemn and at once '*juger sans désemparer le prévenu*,' and on no account was sentence to be deferred.

Waked from a sound slumber at eleven o'clock the same evening, and briefly interrogated by the packed commission, three hours later the Duke was again roused from the deep sleep engendered of fatigue, this time by the commandant of the fortress. Lantern in hand, Harel conducted his prisoner through one dark passage after another, finally emerging into the open air. It was now pitch-dark, and a cold north wind was blowing.

'You are taking me to a dungeon?' asked the prisoner.

'Alas, no!' murmured Aufort, his benefactor, whose duty it was to be present.

A few seconds later and the victim knew his fate. He had been conducted to the *fosse* or dried moat between the fortress and outer wall; before him by the feeble light of torches gleamed the bayonets of the firing-party; at hand lay a freshly dug grave.

With extraordinary *sang-froid* he now cut off a lock of hair and begged an officer present, named Noirot, to see that it was delivered, with a ring and a pencilled note, to the Princess Charlotte; he next begged for the services of a priest, a request met with a gibe. Then the bayonets were levelled, as he fell the words escaping him, 'To die thus at the hands of Frenchmen!'

Hardly was the body hidden by hastily shovelled earth when a terrific howl rang through the enclosure. It was Mohiloff, who in desperation had broken loose, and now frantically tore the half-covered grave of his murdered master.

Such was the tragedy written in the face of the aged lady whom a Frenchman still living saw over sixty years ago. Charlotte de Rochefort never forgave her husband's assassin. Pitiless she remained to one who was himself the incarnation of pitilessness.

Only one or two more facts I will mention. Of European States, three alone protested against Napoleon's crime—namely, Great Britain, Sweden, and Russia. The Duc d'Enghien's dying commands were never carried out. The severed lock of hair, ring, and note never reached her for whom they were intended. Placed under lock and key in the police records (*Archives de la Police*), it was not until the final overthrow of Imperialism after Sedan that they were discovered. And these records contain an order which perhaps more than anything shows the real character of the Corsican Attila. It was this: the faithful Mohiloff was on no account to be restored to his mistress! Dog-lovers, however, may derive some consolation from the fact that poor Mohiloff found kind protectors. And later a follower of the Condés worthily commemorated him in the following epitaph:

Perdita Condæi proles dum quærit amicum
Solum te moriens spectat, amice canis!

THE LONDON OF 'ESMOND' AND 'THE VIRGINIANS.'

By Lewis Melville.

PART I.

THE London of *Esmond* and *The Virginians* is virtually the London of the eighteenth century. It was the age of the splendid, embroidered, beruffled, snuff-boxed, red-heeled, impertinent Folly, that withal knew how to make itself respected. It was the age of the *bel air* and the dignified mien, of perukes and powder and paint, when gallantry was the recognised pursuit and morality was at nearly as low an ebb as in that period of mad excesses, the Restoration. It was an age when men drank deep and swore heavily, when swords were drawn on the slightest provocation and women were left widows through the consequences of careless words uttered by excited men at the gaming-tables. It was an age of three-bottle men and of all-night sittings at taverns. The 'pace' of the *viveurs* of the day was awful. Peterborough lived into the very jaws of death, and Godolphin laboured all day and gambled at night; and Bolingbroke, in his retirement at Dawling, writing to Swift, dating his letter at six o'clock in the morning, and rising, as he says, refreshed, serene, and calm, calls to mind the time of his London life when about that hour he would be going to bed, surfeited by pleasure and jaded with business. An examination of the habits of men of the *beau monde* of the day cannot but fill us with envy of the strength of their constitutions. Of all the wits only Pope, always more or less an invalid, did not lead this life, and of all the wits only he and Prior were not fat. Swift, Addison, Steele, Gay, Thomson, all were corpulent, as they must be who, taking no exercise, spend their time, drinking, in heated rooms.

The difference between the present time and the reign of Queen Anne is not to be explained merely by the lapse of two centuries. There was less difference between the years 1700 and 1500 than in the later similar interval. Progress has made immense strides, and as Bulwer Lytton would have said, the British Lion is aroused and the schoolmaster is abroad.

A picture of the day is conjured up by Thackeray:

'The maypole rises in the Strand again in London, the churches are thronged with daily worshippers, the *beaux* are gathering in the coffee-houses, the gentry are going to the drawing-room, the ladies are thronging to the toy-shops, the chairmen are jostling in the streets, the footmen are running with links before the chariots or fighting round the theatre doors. In the country I see the young squire riding to Eton with his servants behind him, and Will Wimble, the friend of the family, to see him safe. To make that journey from the squire's and back, Will is a week on horseback. The coach takes five days between London and Bath. The Judges and the Bar ride the circuit. If my Lady comes to town in her post-chariot, her people carry pistols to fire a salute on Captain Macheath if he should appear, and her couriers ride ahead to prepare apartments for her at the great caravanserais on the road; Boniface receives her under the creaking sign of the "Bell" or the "Ram," and he and his chamberlains bow her up the great stair to the state apartments, whilst her carriage rumbles into the courtyard, where the "Exeter Fly" is housed that performs the journey in eight days, God willing, having achieved its daily flight of twenty miles, and landed its passengers for supper and sleep. The curate is taking his pipe in the kitchen, where the Captain's man, having hung up his master's half-pike, is at his bacon and eggs, bragging of Ramillies and Malplaquet to the townsfolk, who have their club in the chimney-corner. The Captain is ogling the chambermaid in the wooden gallery, or bribing her to know who is the pretty young mistress that has come in the coach. The pack-horses are in the great stable, and the drivers and ostlers carousing in the tap. And in Mrs Landlady's bar, over a glass of strong waters, sits a gentleman of military appearance, who travels with pistols, as all the rest of the world does, and has a rattling gray mare in the stable which will be saddled and away with its owner half-an-hour before the "Fly" sets out on its last day's flight. And some five miles on the road, as the "Exeter Fly" comes jingling and creaking onwards, it will suddenly be brought to a halt by a gentleman on a gray mare, with a black vizard on his face, who thrusts a long pistol into the coach window, and bids the company to hand out their purses. . . .' The maypole has gone; the churches are not filled on week-days; the toy-shops no longer exist; footmen do not run with links before the chariots of the nobility. Links died out when the streets were lighted with gas, the coaches have been replaced by railways, and even the steam-engine is passing as electricity slowly but surely takes its place as the motive-power of the future. The country inns have died of inanition, though the motor-car may here and there be giving a few hostelries a new lease of life, and the highwayman is as extinct as the dodo.

The city in the reign of Queen Anne multiplied its size manifold, and expanded beyond its walls, but there were still spaces on all sides—Hoxton Fields, White Conduit Street, Lamb's Conduit Fields, Marylebone Fields; but beyond St-Martin-le-Grand the streets were left in darkness absolute, and Temple Bar and the other city gates were closed at night.

Bloomsbury was beginning. Southampton House was there, and Bedford House, at the back of which, and overlooking the gardens, George Warrington lived in the street now known as Southampton Row. Montague House was a landmark, and in 1759 was opened as the British Museum. 'There's Montague House made into a confounded Don Saltero's museum, with books and stuffed birds and rhinoceroses,' Lord March exclaimed at White's in disgust. Soon the Sloane and other collections outgrew their habitation, and a new Ionic structure was erected in 1823 by Sir Robert Smirke, which is regarded as perhaps the most successful imitation of the Greek architecture in this country. The famous reading-room under the dome, however, was not built until half-a-century later. Steele, who, after marrying his 'dear Prue,' lived in 'the third house from Germaine Street, left hand of Berry Street,' in St James's, where the rent was not paid until after the landlord had put in an execution on Captain Steele's furniture, moved to a mansion in Bloomsbury Square. At this residence there was the same difficulty about the payment of rent, and it was here probably that Steele put the bailiff's men into his livery and made them wait at table. 'Do I know the Mall? Do I know the Opera? Why, Bloomsbury is the very height of the *mode*,' the satirical Mr St John assured Mr Steele. "Tis *rus in urbe*. You have gardens all the way to Hampstead, and palaces round about you.' It is almost impossible nowadays to realise that remark about the surroundings of Bloomsbury; yet when Queen's Square was built in the reign of Queen Anne—it was named in compliment to her, but the statue in the gardens is that of Queen Charlotte—much praise was bestowed upon it because of the beautiful view to the Hampstead and Highgate hills, for which reason the north side was left open! The outlook to the north is to-day confined to the immediately adjacent Guildford Street.

South of Old Bourne, or Holborn, as it is now written, was a popular quarter. Old Lord Castlewood had at one time a fine house in Lincoln's Inn Fields, nigh to the Duke's Theatre and the Portuguese Ambassador's Chapel. It was at the Duke's Playhouse that Francis, Viscount Castlewood, arranged to meet Lord Mohun before going on to sup at the 'Rose' or the 'Greyhound,' where they had agreed to quarrel. The play was Mr Wycherley's *Love in a Wood*. Thackeray has mentioned:

'Mrs Bracegirdle performed the girl's part in the comedy, and, disguised as a page, stood before the gentlemen as they sat on the stage, and looked over her shoulder with a pair of arch black eyes, and laughed at my Lord, and asked what ailed the gentleman from the country, and had he had bad

news from Bullock Fair. Between the acts of the play the gentlemen crossed over and conversed freely. There were two of Lord Mohun's party, Captain Macartney in a military habit, and a gentleman in a suit of blue velvet and silver in a fair periwig, with a rich fall of point of Venice lace—my Lord the Earl of Warwick and Holland. My Lord had a paper of oranges, which he ate, and offered to the actresses, joking with them. And Mrs Bracegirdle, when my Lord Mohun said something rude, turned on him and asked him what he did there, and whether he and his friends had come to stab anybody else, as they did poor Will Mountford.'

But the play could not have been *Love in a Wood*, for the disguise of a page is not worn by any of the ladies in Mr Wycherley's comedy, and Mrs Bracegirdle is not known ever to have sustained any part in that work, which was revived at Drury Lane in 1718, when the play-bills stated it had not been represented for thirty years.

In Thackeray's historical novels, as indeed in most of his writings, there is frequent reference to the playhouse. It will be remembered that when Mr Esmond retired from the army he devoted his leisure to the composition of a play, whereof the prompter's copy, once in the possession of Mrs Rachel Esmond Warrington of Virginia, is docketed *The Faithful Fool: a Comedy*. It was a sentimental piece, being written by a young man deeply in love with a beautiful woman, and was admired more by Mr (afterwards Sir Richard) Steele than by Mr Addison. The latter was bringing out his play of *Cato* at the time, the blaze of which quite extinguished the amateur's production, which perished on the third night of its performance by their Majesties' Servants, with only half-a-dozen persons to behold its last agonies. Esmond did not put his name to the piece, which was printed as by 'A Person of Quality.' Only nine copies were sold, though the famous Mr Dennis praised it, and said it was a work of great merit; and Colonel Esmond had the whole impression burned one day in a rage by Jack Lockwood, his man.

In *The Virginians* the Warringtons and the Lamberts go to Covent Garden Theatre to witness a performance of the play, by the great Mr John Home of Scotland, entitled *Douglas*, in which Mr Spranger Barry was magnificently attired as the immortal Norval, and the beautiful Mrs Washington made all the ladies, and even the grenadiers on guard on each side of the stage, weep visibly and audibly. From his grandfather, Colonel Esmond, Mr George Warrington inherited some literary ambitions, and his play *Carpezan* was produced with great success, with Mr Rich, at Covent Garden. George was less fortunate with his second play, a poetical tragedy entitled *Pocohontas*, produced at Drury Lane by Garrick, with O'Hagan (*ne* Geoghagan) as Sir Walter Raleigh, and Mrs Pritchard as the eponymous heroine. At the first performance, in the front boxes sat Samuel Johnson, who could not see, and Joshua Reynolds, who could not hear, and who had come good-naturedly *à deux* to form an opinion of the play. Everything went smoothly enough; but when the heroine rushed to the prisoner's arms, and a number of people were actually in tears, a rude fellow in the pit bawled out, 'Bedad! there's the "Belle Savage" kissing the "Saracen's Head"'—the ignorant fellow not knowing that Pocohontas was the Belle Savage from which the tavern took its name.

The incident in *The Virginians* of the marriage of O'Hagan with Lady Maria was doubtless founded upon the true story of O'Brien the actor who ran away with Lady Susan Fox Strangways, whose relations also sent them to America, with an allowance of four hundred a year, settled by Lord Holland on his niece; but the daring couple eventually decided not to accept expatriation, and returned to England, where they led a happy and contented life.

Though to-day the glory of Covent Garden has faded, yet a portion of the Italian colonnade known as the Piazza remains to remind us of the time when it was one of the sights of the town. Great houses were dotted around the vast square, and there still stands a corner house—the frontage, unaltered through many generations, may be seen in Hogarth's 'Morning'—which after the Restoration was occupied by Sir Kenelm Digby, later by Admiral the Earl of Orford, and eventually by Evans's famous tavern. Covent Garden was one of the great centres of the taverns and coffee-houses which played so great a part in the social life of the eighteenth century, the better class of which were the predecessors of the clubs of to-day, and the less reputable, and those frequented by the lower orders, of the modern public-houses. Each and all, however, were social exchanges for news, which but for these meeting-places would have travelled slowly in an era when newspapers were, to all intents and purposes, non-existent. Button, once the servant of the Countess of Warwick whom Addison married, set up his coffee-house on the south side of Russell Street, two doors from Covent Garden, and it was here that the famous Mr Congreve came, and the still greater Dean Swift. Mr Addison set up his headquarters at Button's, and was usually to be found there, surrounded by 'Dick' Steele, Budgell, Tickell, Phillips, and Carey, the principal officers of his court. There was a time when Mr Alexander Pope sat at the feet of the author of *Cato*, but the latter, 'too fond to rule alone,' could 'bear, like the Turk, no brother near the throne,' and Mr Pope withdrew from that society.

It was on the west side of Bow Street (where Lord Mohun lived in lodgings), at the corner of Russell Street, that the Rose Tavern stood. This had a singularly bad reputation, and a room in the hostelry, showing a midnight debauch, was depicted in the third print of 'The Rake's Progress.' Subsequently it was rechristened Will's, and its character improved. Nowhere was the smoking more constant

than at Will's, that celebrated house, sacred to polite 'letters.' Macaulay has recorded: 'Under no roof was a greater variety of figures to be seen. There were earls in stars and garters, clergymen in cassocks and bands, pert Templars, sheepish lads from the universities, translators and index-makers in ragged coats of frieze.' Old Dryden went there and sat for hours together in a room on the first floor, where the company assembled, and *beaux* contended together for the honour to be allowed to take a pinch out of the great man's snuff-box. Tom's was a resort frequented by Dr Johnson, Reynolds, and Garrick; and Offley's, in Henrietta Street, was visited by all who cared to listen to high-class singing. Not far off was the old Devil Tavern, near Temple Bar, where Ben Jonson had reigned supreme among the wits and gallants of his day. The 'Greyhound' (in Charing Cross, where my Lord Castlewood stayed) and Lockit's (in Spring Gardens) were also popular resorts.

Farther west were the 'George' and the 'Star and Garter,' 'over against the gate of the palace in Pall Mall,' and in St James's Street the 'Cocoa-Tree' and White's Chocolate-House. White's Club, frequented by the fashionable men about town, had its home at the chocolate-house of the same name. Close by the corner of St James's Street which faces that part of St James's Palace which stands between the Colour Court and the Ambassador's Court was the St James's Coffee-House, where fashionable wits forgathered, and Swift wrote so many of his letters to sweet, womanly Stella. 'He never sends away a letter to her but he begins a new one in the same day. He can't bear to let go her little hand, as it were.' Next door, in later days, Thackeray came to live for two years.

Pall Mall, perhaps owing to its proximity to St James's Palace, has always been a favourite street of 'the quality:'

> In town let me live, in town let me die,
> For in truth I can't relish the country, not I;
> If one must have a villa in summer to dwell,
> Oh, give me the sweet shady side of Pall Mall!'

'I lodged in the street called Pall Mall, the ordinary residence of strangers because of its vicinity to the Queen's Palace, the Park, the Parliament House, the theatres, and the chocolate and coffee houses, where the best company frequent,' says Defoe. 'If you would know our manner of living, 'tis thus: we rise by nine, and those that frequent great men's *levées* find entertainment at them till eleven, or, as at Holland, go to tea-tables. About twelve, the *beau monde* assembles in several coffee and chocolate houses, the best of which are the Cocoa-Tree or White's Chocolate-House; the St James's, the Smyrna, Mr Crockford's, and the British coffee-houses; and all these so near one another that in less than one hour you can see the company of them all.'

Thackeray also has written of Pall Mall and its memories, which were especially dear to him. He lived at the south-west corner of St James's Street, and one may well believe that as he walked through the famous street he peopled it with the famous folk who had lived and walked and talked there.

'I remember peeping through the colonnade at Carlton House, and seeing the abode of the great Prince Regent. I can see yet the Guards pacing before the gate of the palace. The palace! What palace? The palace exists no more than the palace of Nebuchadnezzar. It is but a name now. Where be the sentries who used to salute as the royal chariots drove in and out? The chariots, with the kings inside, have driven to the realms of Pluto; the tall Guards have marched into darkness, and the echoes of their drums are rolling in Hades. Where the palace once stood a hundred little children are paddling up and down the steps to St James's Park. A score of grave gentlemen are taking their tea at the Athenæum Club; as many grizzly warriors are garrisoning the United Service Club opposite. Pall Mall is the great social Exchange of London now—the mart of news, of politics, of scandal, of rumour—the English Forum, so to speak, where men discuss the last despatch from the Crimea, the last speech of Lord Derby, the next move of Lord John. And, now and then, to a few antiquarians whose thoughts are with the past rather than with the present, it is a memorial of old times and old people, and Pall Mall is our Palmyra. Look! About this spot, Tom of Ten Thousand was killed by Königsmarck's gang. In that great red house Gainsborough lived, and Culloden Cumberland, George III.'s uncle. Yonder is Sarah Marlborough's palace, just as it stood when that termagant occupied it. At 25 Walter Scott used to live; at the house now 79, and occupied by the Society for the Propagation of the Gospel in Foreign Parts, resided Mistress Eleanor Gwynne, comedian. How often has Queen Caroline's chair issued from under yonder arch! All the men of the Georges have passed up and down the street. It has seen Walpole's chariot and Chatham's sedan; and Fox, Gibbon, Sheridan, on their way to Brooks's; and stately William Pitt, stalking on the arm of Dundas; and Hanger and Tom Sheridan reeling out of Raggett's; and Byron limping into Wattier's; and Swift striding out of Bury Street; and Mr Addison and Dick Steele, both perhaps a little the better for liquor; and the Prince of Wales and the Duke of York clattering over the pavement; and Johnson counting the posts along the street, after dawdling before Dodsley's window; and Horry Walpole hobbling into his carriage with a gimcrack just bought at Christie's; and George Selwyn sauntering into White's.'

Pall Mall is now as much as ever the great social Exchange of London, and if it now contains few historic mansions, it contains some of the best-known clubs in the world; and a man who is acquainted with those whom not to know argues yourself unknown may meet more famous people in an hour in that street than in a week in any other thoroughfare.

RAT EXTERMINATION.

AT a meeting in London of a new association for the extermination of rats, Sir J. Crichton-Browne passed a powerful indictment against the rat as an agent in the dissemination of disease and as a destructive animal. Their yearly ravages amount to thousands, perhaps even millions, of pounds. Apart from the actual losses caused, there is the still more important matter of risk to health resulting from the presence of rats, the direct connection of these vermin with human plague having been abundantly proved. Dr Crichton-Browne further pointed out a new departure in the crusade against rats. Dr Danysz of the Pasteur Institute at Paris had produced a bacteriological preparation containing disease-germs to which only animals of the rat genus were susceptible. When the bait charged with that particular living organism or virus was eaten by these vermin they contracted a disease from which they died in from eight to fourteen days, and which they communicated to other rats. The Australian Government had asked Dr Danysz's aid in the extermination of rabbits, but with a different virus. This virus has already been successfully used on the Continent on a large scale, particularly at Odessa and elsewhere; by the Fareham and Hants Farmers' Club, which has experimented over an area of two thousand acres with satisfactory results; while the rats on the London Tube Railways have been dealt with in the same manner. The rats in the London Underground Electric Railways had been eating insulations and causing 'short circuits.' The virus was mixed with flaked oats for rat consumption. Rats so treated are said to leave their usual haunts and confined spaces in search of air, and die in the open. Spring and early summer is suggested as the best time for such a crusade.

Another interesting experiment has been conducted on the island of Little Cumbrae with a preparation called 'ratin,' which is said to have been tested by the German, Russian, and Norwegian Governments. Little Cumbrae covers an area of nine hundred acres, and is situated in the mouth of the Clyde, to the south of Great Cumbrae, and about two miles from the Ayrshire coast. It rises four hundred and nine feet, and has a lighthouse. It appears that about a hundred years ago the island was inhabited by about seventy families, who made their living partly as pilots and partly as scouts, bringing messages of importance and urgency to land and from there to Glasgow; but the only remains of their dwellings is the old inn, which is now used as a sort of barn. Rats have been on the island for a number of years, but only during the last four years have they been a considerable trouble; when about that time the French steamer *Lady Isabella* was wrecked off the coast, the rats swam ashore, and have multiplied at a tremendous rate.

The island is the property of the Eglinton family, and is held on lease by Mr E. S. Parker, of Liverpool, the well-known Demerara sugar-planter, who holds it purely as a sporting estate, rabbit and woodcock shooting being the form of healthy recreation it affords him. The island is very hilly, and in the summer-time is covered with large ferns and is a mass of bloom. The rats, of course, found plenty of food, and the keeper reports that last year he lost five tons of turnips; and at Christmas-time the rats attacked a twenty-pound turkey, killed it, and completely devoured it, leaving nothing but the bare bones. They have also been a terror to the young and weaker rabbits. Rose-bushes, wild-duck nests, mangolds—in fact, almost every department of feathered and earth culture—were in a constant state of struggle for life against the depredations of the rats.

It therefore became imperative for Mr Parker to do something properly to exterminate the vermin, and it might be mentioned that he had used every kind of poison or other remedy on the market without any success whatsoever, until he applied for assistance to the Ratin Laboratory. A representative went over the island, terms were arranged, and last January ratin was used, with the result that a total extermination is said to have been effected. A new exterminator is being introduced, which consumes the body of the rat. This we hope to describe later.

ON THE MOORS.

CLOSE to the heart of Nature! Far away
From crowded streets, from dust and din and strife;
Out on the wide green moors where, day by day,
Tired souls may drink the very wine of life.
No finer tonic than this bracing air,
No better antidote for fret and care.

Unbroken, vast, dream-haunted solitude
Of amethystine shade and golden light;
A subtler charm in every varying mood,
Or mystical and wild, or soft and bright.
No sound intrudes save when a plover's cry
Cleaves the pure azure of the tranquil sky.

A million flowers, with eyes of tender blue,
Peep where broad ferns their emerald banners toss;
A million pearls, made of the morning dew,
Hang all a-tremble on the sphagnum moss;
And purple foxglove-bells beneath the trees
Are gaily swung by velvet-coated bees.

Come! By the crystal of the moorland streams
Soft turf invites the weary limbs to rest;
Miles off the busy highway faintly gleams,
But peace reigns here; and it is surely best
To leave the round of labour for a space
And spend glad hours with Nature face to face.

E. MATHESON.

SIXTH SERIES.

THE TEACHER OF AUCHNACOUR.

By C. EDWARDES.

I.

JOHN STANHAM came to Auchnacour to engage with certain little problems of the higher mathematics. His university expected it of him. Other men might spend the vacation in climbing Alps or trips to America; but he was not like other men.

It was by complete chance that he hit upon Auchnacour. He saw the advertisement in a northern paper which Grant of Jacob's—a frivolous don of a frivolous college—had rolled into a sort of football and pitched through his open window at midnight. He was burning midnight oil; though, as a matter of fact, it was gas.

The paper football struck him on the head; and presently, his intellect being disturbed by the interruption, he smoothed out the paper, and there it was: 'Parlour and bedroom to let for August. Lovely district. Inverliggan Station eleven miles. Maclean, Auchnacour, Inverness-shire.'

His imagination took fire at once. He wasn't supposed to have any imagination, only the keenest of cold, keen common-sense. But though he himself would have smiled rather pityingly at any one who had charged him with the possession of that exhilarating yet untrustworthy faculty, he had a certain amount of it. He sat and saw visions of lonely crimson-sided mountains with rugged heads, of misty green valleys threaded by brawling white streams; and before he went to bed he penned a quite formal letter to Maclean of Auchnacour requesting further information.

The answer took four days to arrive. This in itself was magnificent proof of Auchnacour's remoteness, and therefore utter tranquillity.

The rooms were in the schoolhouse. There was no bath on the premises, but a river in the strath with very suitable pools for a gentleman. Mr Æsop the artist, who had been the lodger a year ago, had delighted in these natural baths chiselled out of the rocks. There was a very good lamp for reading, a pine-wood on one side of the house; and the writer, Kate Maclean, had a certificate for proficiency in cookery as well as an Edinburgh University degree for other attainments. She and her sister Fiona would do all they conveniently could to make Mr Stanham comfortable if he came.

The letter interested and even amused John Stanham greatly. He wrote again, and received another reply, in which Kate Maclean promised not to bore him with talk about education—'shop,' as he had termed it—and begged to remain his obedient servant. A postscript said she should take it for granted Auchnacour did not attract him unless he telegraphed an immediate answer to Grieg Bridge, the nearest office.

'I've set her back up, I can see,' said John Stanham with a grim chuckle.

He telegraphed in less than half-an-hour: 'Expect me next Thursday.' It was one of his odd characteristics to like people who had tempers. He had one himself, though he kept it under lock and key, so that few suspected its existence.

It was Friday morning ere he reached Auchnacour. He hadn't taken bad weather into consideration, and the wind and rain on the Thursday evening, when he got out of the train at Inverliggan, were so violent that he couldn't and wouldn't face an eleven-mile drive in the teeth of it, even to keep his promise to a punctilious Highland schoolmarm who had given him such express instructions about ways and means. She had asked him what he would like for his supper on the Thursday evening, and he had telegraphed the simple word 'chicken.' That ended the correspondence.

Friday was a bright morning, and Stanham was in bright spirits when the Inverliggan inn's dog-cart set him down at the schoolhouse. A pretty ivy-clad place, with the mountains towering across the strath, and that pine-wood very black on one side. But, heavens! the shock it gave him to see about thirty boys and girls capering on the green plot in front of the cottage.

'Do you mean to say they don't have holidays up here?' he asked the driver.

 [*All Rights Reserved.*]

The driver didna ken the ways of Auchnacour. They were all Catholics in this part, he said. Maybe they had times of their own for work and holidays differing from the times of other districts.

The children were mostly barelegged, and all seemed to be briefly awed by John's arrival. They crowded to the railings and watched him. Two or three of the boys had green tartan petticoats. As for the girls, never in Great Britain had he seen such black-haired little gipsies.

And then Kate Maclean came to him—a black-haired, determined little aboriginal Celt herself, all in white, save for a rowanberry-red bow at her neck. 'You are the gentleman, I suppose?' she said.

John smiled and supposed he was. 'You don't exactly have regiments of strange gentlemen, Miss—or Mrs—Maclean, I venture to think?' he added.

'Och, no, not at all,' said she. 'But we were looking for you last night. We sat up until one o'clock, Mr Stanham. Not that it matters indeed. But please to come in.'

She gave him about five minutes, introduced him to her sister Fiona, and then went to the door, clapped her hands, the children fluttered into school like poultry to their food, and John had the freedom of his surroundings. They were very much what he had been prepared for, save this considerable and annoying surprise about the children.

'Miss Fiona Maclean, I presume?' he said to the evidently younger sister; and then he learnt that they were both 'Miss.'

Fiona's eyes were not nearly so black as Kate's. They were a soft brown. Moreover, she seemed shy, which might be another annoyance to him, for he objected to anything so unreasonable as shyness.

'You'll be wanting some tea?' she said, and fled.

He unpacked, descended to find the tea on the table, rang and said he didn't want it—and then, very absurdly, changed his mind. 'It's quite all right,' he said. 'There's nothing to look so distressed about. I had coffee for breakfast only two hours ago; but—I will make an effort.'

She had nothing to urge against that; just left him to his effort. And afterwards he took his stick, climbed off into the hills, got caught in a mist, lost himself, and was exceedingly fortunate to strike the strath at nightfall, and a thatched cottage which provided him with a barelegged lassie as guide back to the schoolhouse. The lassie's name was Dodds. It is important to mention only because of the calf Fergus, which three weeks later her father, Alec Dodds, presented to John Stanham.

The way Kate Maclean lectured him that evening, even before he changed his clothes!

'I'm not doubting, Mr Stanham,' she said, 'that you are a very clever gentleman in England—you must be to teach mathematics to undergraduates; but you have to remember here that you are in the Highlands. It's not very sensible, indeed, to climb about without a map, and with nothing in your pockets to eat. I should not have thought anybody could have been quite so foolish.'

Fiona stood a little way behind her black-eyed sister during this reproof. She seemed dreadfully shy about it, yet eager; as if to see how far her sister's tongue would go in audacity, and how he would bear it.

'I'm really very sorry,' said John Stanham. 'To me it's a joke rather than an event of such tragic importance.'

Kate Maclean then turned sharply to her sister. 'What are you standing like that for, Fiona?' she demanded. 'Take some hot water upstairs at once to his room, and the foot-bath.—And I shall give you some whisky this minute, Mr Stanham!'

John went upstairs shaking his shoulders. 'What an acidulated little virago! About thirty!' he conjectured. 'Poor creature! No doubt tow-headed and barelegged children are trying to an ordinary brain.' And yet he didn't know about the 'poor creature'! 'Artful creature' were better. Why didn't she tell him she kept a school? She hadn't a conscience—that was why.

Fiona tapped so soft and low that he didn't hear her, and came in with the foot-bath and a meek and humble downcast look.

'I wish to goodness,' exclaimed John Stanham, in his shirt-sleeves, 'you'd knock before—— That is, yes, please, set it down there, anywhere.'

She whispered pathetically that she *had* knocked, and he could have knocked himself down afterwards.

There was something singularly touching about this younger sister. Two-and-twenty or so, he thought. The making of a fine woman physically, with eyes of such an appealing colour of brown. Shapely too. Her nose of a singularly estimable outline—a well-defined hypotenuse, and so forth. Dreadfully bullied by that encyclopædically crammed person her sister, of course!

An admirable little supper was ready for him when he came down in a glow at half-past ten o'clock. Men and supermen! Devilled kidneys *à la* something or other, and a trout mayonnaise the like of which——

'Do you mean to tell me,' he asked Kate Maclean when she appeared, after the trout, with two Highland mutton-cutlets, 'that you feed your guests always in this sybaritic fashion?'

'I don't know about sybaritic, Mr Stanham,' she said; 'but I like to show that I'm not a teacher in cookery for nothing. And—you are the first guest, as you call it, that we have had at all, except Mr Jessop last year. And—would you mind if I go to bed? The strawberries and custard you can perhaps help yourself to.'

'Certainly,' said he; 'certainly go to bed, Miss Maclean.'

'And,' said she at the door, 'please don't do such a very youthful thing again as to wander away like this. I was talking to Mr Buchanan, Lord Ambleside's ground-bailiff, about it just now; and he asked if you had your senses. "Och, yes," I said to him, "for the gentleman teaches mathematics to the chosen people of England, and mathematics is

just the highest kind of wisdom, filtered," if you'll excuse my saying so, Mr Stanham.'

'Yes?' said John Stanham. 'And what did he say to that?'

Kate Maclean's shoulders fidgeted, and a strange elfish smile seemed to astonish her lips and eyes, even as it astonished John Stanham.

'Och!' she said, 'you mustn't mind Peter Buchanan, though he did say he was sorry for the chosen people of England to be in such hands as that. Good-night to you, Mr Stanham; after this I'm running away.'

Such was John Stanham's first day at Auchnacour.

II.

He did some high mathematical work at night. It ended about two o'clock, when, to match the mathematics, he turned the lamp so high that the glass burst like a bomb. He did a little more the next day after breakfast, until the children came whooping on to the green, mostly with sprigs of bog-myrtle in their caps or coats or pinned to their pinafored breasts. Fiona told him it was the birthday of Lord Ambleside, the laird, and that the bog-myrtle was his lordship's family emblem. He told her then about the lamp.

'Oh dear!' said she, 'did you hurt yourself?'

'Not at all,' he replied. 'And I'd have sworn you'd have made just that inquiry.'

Then Kate Maclean came in and spoke very differently. She wondered he hadn't noticed that almost every drop of oil in the lamp was consumed. Where, moreover, was his gift of smell that he hadn't been poisoned by the odour of wick and smoke which must have ensued from his ridiculous treatment of the lamp?

But it wasn't this she had come to say. Would he mind, she whispered, with more of that elfish smile, asking her to give the children a half-holiday, partly in his own honour and partly in Lord Ambleside's? Mr Jessop had coaxed two out of her, and she wanted so badly to visit a poor dying old man named Cameron three straths away to the south. 'Would you mind, Mr Stanham? Or do you, on mathematical principles, object to holidays out of season?'

John Stanham burst out laughing. 'My dear Miss Maclean,' he said, 'I beg of you give them a *whole* holiday. The ingenuousness of—that is to say, *do* give them a whole one. I was a boy myself once upon a time.'

She nodded rather curtly, thanked him, and went away; and in two or three minutes all the thirty youngsters were at full shout outside his window. The higher mathematics hadn't the ghost of a chance against them. He confounded them, and sought sandwiches from Fiona. Her shy smiles were a pleasant enough tribute to him, but in no degree delayed him. This time he took Kate's own map, which she had put out for him. And from the summit of the Auchnacour strath's southern boundary he saw a sturdy figure in white scaling the farther side of the next strath—a much more serious climb, with black crags capping its wall and several kinds of death hanging about, as John Stanham had already ascertained less than a day ago. He sat and watched her.

'She said *three* straths, unless I'm mistaken!' he murmured. 'And she's got to come back, whatever the weather! H'm!'

His colleagues at the university knew that when he said 'H'm!' in that tone he was on the brink of a good achievement or even a discovery.

Be that as it might, he sat long in the unwonted sunshine, and only when he bestirred himself realised that he had been sitting on wet moss for a long time. And then he made manfully for the strath beyond, and the strath beyond that also. But rain and mist came on, and he did not reach the third strath, in which Roderick Cameron lay dying, with the black-haired little teacher helping him in this last solemn stress of his hard, humdrum life. John Stanham turned tail before the mist and rain, and was glad to reach the schoolhouse and Fiona's gentle, blushing solicitudes with no worse trouble of his own than a barked shin due to a slippery rock.

'Do you not feel anxious about your sister, out there in such weather?' he asked Fiona, whose brown eyes were distinctly agreeable to behold.

'No,' said Fiona; 'no indeed! Nothing ever hurts Kate. She goes wherever she pleases, and she will have her own way, Mr Stanham. There's no one like her, and I often wish I was only one-half as clever as she is!'

There was perhaps nothing in the world John Stanham liked less than to hear anybody's virtues belauded in the superlative degree. His knowledge of human nature was so profound that he couldn't possibly believe in such extravagance.

'Rubbish!' he said. 'A woman isn't sent into the world to be clever. Remember that, Miss Fiona. By the way, what a charming name Fiona is! It suits you! There! I'd better get ready for dinner.'

Though blushes became Fiona quite exceptionally, he didn't, somehow, care to be associated with their genesis. When he praised her name they came to her cheeks like Jacks-out-of-boxes at a touch. He hoped she didn't catch that other inferential compliment. Paying compliments was quite foreign to his nature. Indeed, when he came to think of it, he couldn't remember when he had ever paid one before. And yet he begat another this very day.

Kate Maclean returned, all sodden and weary, about nine o'clock. 'Roderick Cameron is dead, poor fellow!' she said when he stepped to the door at the sound of her feet. 'I'm so glad you asked for that half-holiday to-day, Mr Stanham! He was quite happy with me at the last.'

'I—don't wonder,' said John Stanham, and then he retreated to his hearth, on which a fire of mingled peats, coals, and pinewood burned cheerily. That was his second compliment paid in one day.

After that his vacation at Auchnacour seemed to fly. He got used to the children, even their horrible

chant of 'Twice two are four, twice three are six, twice four are eight,' up to 'twice ten,' and so on. He obtained for them a second half-holiday on an occasion when it suited Kate Maclean to walk into Grieg Bridge and talk to the doctor about Agnes Fletcher, a child with a cough and a failing appetite.

The school urchins assembled in a huddle outside his parlour window and sang 'God save the King!' in gratitude for this second pleasure. He bore it very well, though it brought collapse upon a very fine and coherent thread of higher mathematical thought. And he went out afterwards and cast coppers into their midst, and laughed himself rather hoarse in the endeavour to inform Kate Maclean, who stood near with her hands on her sides (like a washerwoman), that if he had had royal Guelphic blood in his veins he would doubtless have appreciated the anthem still more.

The main thing about the flight of time at Auchnacour was its effect in making him see that Fiona Maclean was little better than a somewhat pretty noodle. Not always an amiable one either. She had sundry little disagreeable tricks of conduct. 'I'm thinking, Mr Stanham,' she said one day, 'that you despise me because I'm not smart like Kate. You look at me sometimes as if you do. And I want to tell you—but, you mustn't tell her—that Kate wasn't always the fine woman she is now. She had a disappointment when she was nineteen. Samson Adams, the schoolmaster at Balwhinnie, threw her over when she was nineteen because she was so bad-tempered. They were engaged, you know. But I wouldn't for anything that you should say a word about it.'

This was an appalling revelation of character (Fiona's) to John Stanham. Thenceforward he could hardly look with patience at her placid brown eyes. Besides that, he caught her reading his letters.

'I thought it was one of Kate's,' she stammered; and though he said only 'Indeed!' he felt like adding, 'I'm afraid you're a young liar, as well as what when I was a boy we used to call a sneak.'

Kate Maclean, on the other hand, improved upon acquaintance—improved out of all likeness to the person he had believed her at first to be. That elfish, rather gipsyish, smile of hers grew to be quite as pleasant as the heather crimson on the hills. And how she did look after him! The surprise delicacies with which his dinner-table greeted him after wet days in the mountains! And the quite flattering, yet honest, way in which she thanked him when he gave her shillings and half-crowns for certain of the crofters, about whose hardships (and pig-headed heroism) she never tired of telling him.

It was in the last week of his time that Alec Dodds insisted on giving him the mustard-coloured calf with the white blaze on its forehead. He happened to be passing Dodds's cottage, with the roof half thatch and half galvanised-iron, and obliged Kate Maclean by taking the letter which the post-girl had left at the schoolhouse for her to take to the out-of-the-way Dodds.

'It's from Canada, Mr Stanham,' said the teacher, 'and I know it's news of some kind. He has been waiting for this Canada letter for a dreary long time. He has a brother there who has done miracles in farming, and there's some talk about his going out with all the family. Will you think him very rude if he asks you to read it to him?'

'Och no!' said he with a laugh.

Then she laughed too, in that pretty, elfish manner; for she knew his 'Och!' was just well-meant mockery of her own many 'Ochs!' at all times.

John Stanham read the letter to Alec Dodds, his very untidy wife, and a squealing baby. He read it with a composed devotion to good works which, though he didn't know it, was the result of association with Kate Maclean herself.

There was a draft on London for five hundred pounds in the letter. Alec and his little lot were all to take ship for Montreal, where the rich brother and uncle would meet them and transport them to a life of luxury. Silver had been discovered on his lands, and he had tons of money, he said. Alec might begin by giving away all his poor trifles of property to his neighbours.

Tears of happiness were the result of the letter. The baby cried like its parents. John Stanham told them not to be such fools, and that there was nothing to cry about.

And the next day Murdoch Dodds, one of the children, came to school leading the calf, which was a present to 'the gentleman' for his kindness in being the interpreter of such happy news. The whole school and its teacher were in raptures about the calf's fate. John Stanham wasn't down to breakfast at the time, and when he did come down Fiona first explained about the quadruped, and then Kate Maclean rushed in from a geography lesson to explain further.

'I won't have it,' said John Stanham.

'Och! but you'll be insulting a Highlander's most sacred feelings of pride if you refuse it,' said Kate Maclean. 'Of course you will take it!'

'Honour bright! I must?' he asked.

'You most surely must,' she replied.

'Then,' said he, with an inspiration that warmed him more than anything he had ever done in the higher mathematics, 'if I can't get out of it, may I—will you—that is, you *must* keep it for me. Keep it until it grows into a cow, Miss Maclean, and next year when I come again I'll drink its milk.'

Kate Maclean smiled and nodded.

'Yes,' she said softly, 'that will be a very nice bargain, though I do not think it will be ready to milk quite so soon as that. And I shall take care of it and feed it on my meadow as if it were my own little beastie.'

'Amen!' said John Stanham gaily. He insisted on shaking hands upon the understanding.

Then Kate Maclean rushed back to the broken geography lesson, and Fiona brought in the eggs *à l'empereur*, which her sister had prepared before going into school.

When John Stanham's time at Auchnacour ended he got sadly into the carriage sent from Inverliggan. The children stood respectfully outside to see him go, and, with their hands behind their backs, sang 'Auld Langsyne' in a way that affected him remarkably.

'I shall come back—as truly as I live!' he said to Kate Maclean, whose dark eyes were for once sad.

'Och! I hope so,' she said. 'But of course you will not.'

He pointed to the calf in the meadow.

'There's my surety,' said he. 'And so good-bye, and God bless you, Kate Maclean.'

She was the first person he had blessed like that by word of mouth since his mother's death. Upon reflection, he scarcely understood his impulsiveness. Indeed, it bothered him. There were times, in Oxford again, when he recalled it as if it were an indiscretion only one degree from a crime. There it was, however, a very firm memory in him. He remembered also the supremely ridiculous tears which Fiona Maclean had shed in bringing him his breakfast for the last time.

'Sentimental little donkey!' he termed her at least once in recalling those tears.

(To be continued.)

MEMORIES OF HALF A CENTURY.

By R. C. Lehmann, M.P.

PART XIV. AND LAST.

IN the late summer of 1862 my father was called to America by pressing business affairs. There he found himself in the very thick of the commotion and agony produced by the Civil War. He remained in the United States till late in the year, returning again, after a brief stay in England, in the spring of 1863. The following extracts from his letters written to my mother give a vivid account of his impressions of the state of the country, together with references to the distinguished Americans with whom he was brought into contact.

The battle of Bull Run mentioned in the first letter is the second battle of that name, and was fought on 29th August 1862.

'Willard's Hotel, Washington,
5th Sept. 1862.

'I wrote you a hurried note on Saturday last, 30th August, from New York, to say that as the news from Washington was threatening I would defer my visit. On Sunday morning the papers published a despatch from Pope, claiming a great victory over the rebels at Bull's Run. The despatch was dated Friday night, and people thought the danger over. Early on Monday I left New York and got here same night. Ever since I have been in the midst of the intensest and most painful excitement. Instead of a victory for the Federals they had been shamefully and fearfully beaten. Rumours flew thick and fast, and by Wednesday morning it oozed out that the whole army was back in, or coming back to, the old camps around Washington. The army is utterly disorganised, and wants rest, drill, and reinforcements. Washington is a camp. This hotel contains Sigel, Banks, and endless minor lights. Generals and colonels all over the place, orderlies flying, troops moving night and day, artillery rumbling, cavalry marching quickly, infantry slowly. In the midst of all this I have to attend to the most important interests of the firm, and think I have been very successful. Whenever I wanted to write to you somebody called, a telegram came or had to be sent, I had to dance attendance at the War Office or write pressing letters. I meant to go back to New York yesterday, but business kept me, and I shall not get off till this evening. . . .

'Washington is now considered safe, and if the rebels cross into Maryland people think they can be checked. However, all is conjecture. They are probably too clever to risk themselves so far from home.'

'Brevoort House, New York,
8th Sept. 1862, 10.30 P.M.

'Here I sit sweltering, with nothing on but a shirt and a pair of trousers. The heat has been maddening to-day, and it is 80 degrees now by the glass which hangs by the open door of the hotel; and in spite of all this terrific heat, which almost unfits one for anything but rest of mind and body in a darkened room, one has to be up and doing. The devil is loose. The Confederates are in Maryland, threatening Baltimore and Philadelphia and scaring the North from its propriety. The poor bewildered Government at Washington, with its imbecile Ministers and Generals, is at a discount, and perhaps before many days are over will be among the things that were.

'Possibly they may weather the storm yet, and retrieve their fortunes by a defeat of the bold Southerners, who are playing a dangerous game. *Nous verrons.* In the meantime, let us be joyful that I am safe back in New York and have not to throw myself upon the protection of the British Minister, or take ignominious flight on a Federal gunboat.

'The humiliation of this people is not a pleasant sight to behold. The wailing and impotent gnashing of teeth of a great nation is a deplorable spectacle. I have written over forty pages of letter-paper to-day, and in spite of the heat have to keep my head cool to steer our own old ship safely through the breakers. No fear of it, but I am

thankful I am here; and only now and then, when the picture of you and those dear boys and that lovely angel baby, and the fresh greensward at Woodlands, will mix itself up with ever such incongruous and anomalous circumstances and surroundings, my head grows weary and my heart sickens for home, sweet home. . . .

'However, there is a good time coming, when I shall press you all once more to my breast. Amen. I do so long for your next letter to tell me you are all at Shanklin enjoying the dear old sea and the pebbles, the diamonds and the little crabs, the roses and our old friend the hydrangea at the Lovers' Cottage, the breezy cliff and the waving corn-fields, the shady woods and the rich green fields, the toothless Sampson and the absence of the X.'s.'

Recruiting advertisement enclosed in the foregoing:

'HARRIS LIGHT CAVALRY.

POPE'S ARMY.

'This regiment—well known for its brilliant service at Falmouth, and for 3 dashes within the lines of the enemy at Anderson's Beaver Dam and Frederick's Hill on the Central Road of Virginia, Jackson's main line,

NOW WITH GEN. POPE'S VICTORIOUS ARMY

in the healthy and cool region of the Rapidan, the most fertile and beautiful part of Virginia—

WILL RECEIVE

RECRUITS

at 600 Broadway, N.Y.

'The Cavalry Soldier, spared the more irksome duties of the profession, mounted on his trained charger, armed with Pistol, Carbine, and Sabre, represents the Knight of Old, and like them can gain Glory by individual prowess and daring. It, therefore, requires the best men, and none will be received but young men of good physique and habits. Promotion depending on Merit. The new recruit will have chances with the old.

'Come, share with us our experience, our past, and future.

'All bounties, Land Warrants, &c., given to this regiment. J. MANSFIELD DAVIES, *Col.*'

'PARKER HOUSE, BOSTON,
21 *September* 1862, *Sunday*.

'I left New York at five P.M. yesterday, on board the Fall River steamer *Metropolis*, one of those wonderful floating hotel contrivances for which the Americans have an especial genius. The voyage was very pleasant, the sea smooth, the scenery, as long as daylight lasted, lovely, the arrangements for food and sleep marvellous, considering the host of passengers, and altogether the mode of transit highly preferable to the railway. At half-past four this morning the boat poured us out (like coals from a cart into a cellar) into a railway train, which brought me here about seven. This is a new hotel on the Brevoort Hotel plan, where you can take your meals *à la carte* at whatever hour you please, and preserve your individuality. Both in New York and here I have had a sitting-room, a bedroom, with bathroom attached, a very complete and comfortable arrangement, which you could not have in London although you might be willing to pay for it. My daily breakfast consists of a glass of iced milk, a couple of eggs, gorgeous peaches (costing only one penny to three-halfpence each), pears like the big French ones, and a melon. Bread and butter, of course. Never later than eight o'clock, and often earlier. This simple and cool diet in the morning suits the climate wonderfully. At lunch very little meat and again fruit, and only one solid meal—dinner at half-past six to half-past seven. I was so tired when I arrived, as the night had been so much broken into with rising at half-past three, that I went to bed and slept till ten o'clock. After breakfast Sebastian S. came, and we took a lovely ride and walk together to Jamaica Pond. The country is really charming about Boston, and I dare say E. saw it clothed in all its summer beauty in his mind's eye when he used to point out the shivery and icebound landscape as objects of admiration. It is a lasting pity you and I were not here together in September and October, instead of those dreary winter months. The great heats seem to be well-nigh over, and the weather is really enchanting. I wanted very much to take a few days of Lake George and Lake Champlain, to see the best of American scenery in its prime, but I cannot get the time. To-morrow I have only one month more of America, and I must make every day tell while I am about it. The last thing I did in New York was to reconstruct the whole office. They had all *talked* about the irksome present arrangement, so at last I cut the Gordian knot, had an architect in, got my plan down on paper, had an estimate made, and decided the thing. . . .

'I said good-bye to Mr Owen and Miss Griffith on Friday evening. Poor thing, she is in sore tribulation about the course of events in this country. Monday last we had a victory announced by McClellan. Then nothing was allowed to transpire officially from him until Friday, when at last we heard: "The Rebels are retiring to Virginia, and Maryland and Pennsylvania are safe." "As we were," and all to begin again *ab ovo*. I had hoped that now some compromise might be attempted. Both North and South have failed at invasion, and might now come to terms, "sadder and wiser men;" but nobody seems to think that there is the remotest chance of peace. It is awful! Such carnage has never been known. There seems to be no generalship, no manœuvring, but just a butchery that lasts a week. Whoever gets most reinforcements and holds out longest kills most and keeps the field. The victor buries his own and the enemy's dead, and nothing further happens. No victor has ever followed up one of these great holocausts to any great success. This is now the third within three months. The week's battles of the Chickahominy, the week's battles at Manassas

and Centerville, and now again a whole week's carnage at Sharpsburg.

'On the boat last night a Philadelphia clergyman on his way to do duty for a brother-clergyman in Boston opened his heart to me. "The country is mad, and the Government is hurrying us on to ruin with ever-increasing speed. I have only one wish, and that is to go away for ever and live in England, where you have peace and liberty."

'I sent to Dr and Mrs Howe to see whether they were at home, but both are in the country. So I went up to poor old Drexel. He lives in the fifth story of a Hotel Garni at the corner of Boylston Street. When you are up there you can almost overlook the whole United States.

'I must tell you some Irish-waiter stories. When Seb. L., Dr Mackay, and Livesey were dining with me, and we were in the heat of discussion, the waiter whispers into my ear, "Shall I leave the vegetables on the table, sir, when I bring the partridge?" I said "Yes," in a half-angry tone at the stupid interruption, whereupon the waiter retires happy, saying, "Thank you, sir; just my style," which disarmed me.

'The next I may have told you before. I was dining with Livesey at the splendid new Fifth Avenue Hotel. There were different kinds of pastry, and Livesey, pointing to an open green gage tart, says, "Let's try the broad-gauge system." The waiter at once corrected him, "Green gage, not broad gauge;" but he saw his mistake by our laughter, and quietly observed to himself, "Sold again." Later on nearly everybody had left, and Livesey said, "I fear we shall be the last," when the facetious waiter, anxious for his innings, remarked, "Though last, not least." Imagine all this in England. . . .

'Just another word before closing this letter. At last we have great news in the President's proclaiming all slaves of people in rebellion on the 1st January next free for ever. There is no going behind this, and slavery is now doomed in the United States, whatever that may be at the end of the war. As the South will certainly not submit before the end of the year, the proclamation amounts to virtual abolition wherever the North may succeed in planting its flag. I am delighted, but I see no peace. On the contrary, the war will probably only begin in earnest now, and get more inveterate and savage as it proceeds.

'I saw Mr Fields yesterday. They expect to be back in town in a few days, and hope to see much of me then. The weather here is supremely beautiful. Just as pure, crisp, and exhilarating in its summer or autumn as in its winter guise. There is not the frightful rush and noise of New York; and instead of immense distances everything is close at hand.'

The next letter describes a visit to Ralph Waldo Emerson at Concord. The Fields of whom my father speaks were Mr and Mrs James T. Fields. Mr Fields was the well-known Boston publisher, the friend of Dickens and Wilkie Collins. Russell Lowell is, of course, the author of the *Biglow Papers*, who in his noble Memorial Ode on Robert G. Shaw thus refers to his own two nephews who fell in the war:

I write of one,
While with dim eyes I think of three;
Who weeps not others fair and brave as he?
Ah, when the fight is won,
Dear Land, whom triflers now make bold to scorn
(Thee from whose forehead earth awaits her morn),
How nobler shall the sun
Flame in thy sky, how braver breathe thy air,
That thou bred'st children who for thee could dare,
And die as thine have done!

The son of Oliver Wendell Holmes recovered from his severe wound, and is now a Judge of the Supreme Court of the United States. Miss Griffith was a lady of great charm and refinement, and a poetess of merit. My father, as I have already related, had met her first at Lord Lytton's house, Knebworth, in the summer of the previous year.

'Parker House, Boston,
27th September 1862.

[F. Lehmann to Mrs F. Lehmann.]

'I have just returned from Concord, where I have paid a visit to Ralph Waldo Emerson. I sent him papa's [Dr Robert Chambers's] letter of introduction, and received the enclosed kindly reply. I went out at eleven by rail, found Mr Emerson waiting for me at the station in his buggy, and recognised him at once by portraits I knew of him. A charming old sage, with the kindest and most refined manner. He speaks well, and likes to speak about all manner of interesting men and things. From his writings I had expected a sort of oracular Carlyle, but a total absence of affectation or mannerism put me at once at my ease. The day was bright, pure, and serene beyond description. He drove me about through the dreamy, quiet village of Concord, pointing out its lions. A small gray obelisk records the spot where the first blood was shed between the Colonists and the English in the revolutionary war. The clergyman of the place asked all his congregation one Sunday to join him next day each with a young tree to be planted near this monument. It was done, and now they have grown up to a pretty grove and avenue. Near it stands the manse about which Hawthorne has written so charmingly. On we drove to a slight eminence, whence Emerson pointed out the different villages. One was said to be built on shoes, another upon peach-stones, and a third upon milk, according to their respective trades.

'We got to his place about two. Nothing could be simpler and more unpretending. He had asked Hawthorne, William Ellery Channing (a poet), and a Mr Bradford (a literary man) to meet me at dinner, at which his wife and daughter completed the party. Hawthorne remembered me and you quite well before I gave him a note of introduction which Fields had volunteered. He is just the same shy, monosyllabic man, apparently with oceans of

thoughts and talk if he could only turn on the stream.

'Emerson asked much after papa, and everybody seems always most anxious to make sure of his being the author of *Vestiges of Creation*.

'The conversation was so pleasantly animated that the six hours and a half had slipped away before I was aware of it. Hawthorne pressed me twice to come and see him. All except him thought the South would soon give in. Fight them with abolition of slavery and they had no chance. It is quite inspiring to see men like Emerson quietly ignore what some others call the stern logic of facts, and continue to declare their unshaken faith in the triumph of the North and the restoration of the Union.

'I have breakfasted twice with the Fields, each morning at eight at my request. Their house is a perfect gem of brightness and cleanliness. They have a charming view over the blue Charles River. Each room is full of books and engravings, everywhere portraits of English authors, everywhere autographs and letters from eminent men; an atmosphere of literature and refinement pervading the whole. We had a long walk yesterday, and to-morrow he will take me a walk of twenty-five miles to the Blue Hills to show me the country about Boston. We are drawn together by our common great affection for dear Dickens, whom he worships. I was glad to be able to give him one of Dickens's good *cartes de visite*, and have promised more from England. Fields took me to poor Longfellow, who received me very kindly, and was glad to hear my news of his literary friends in England. He lives in a little paradise. Since the frightful loss of his wife, Longfellow is completely crushed and just barely vegetates. He had fame, money, and perfect domestic happiness, a loving wife and charming children. One little match, which she ignited by treading upon it, did all the mischief. Agassiz has just lost a brother-in-law, Dr Carey, and is in deep distress. Russell Lowell lost two nephews, fine young fellows, in the last battle. Wendell Holmes, the life of Cambridge, had started off to the battlefield to find and tend his wounded son, shot in the neck. To-day I hear he has found him, and is bringing him home with every hope of his recovery, at which there is great rejoicing. Fields took me to Lowell; but he was not at home, and considering the loss he has just had I was scarcely sorry. You see the war is spreading death and desolation through all these bright homes, and still none of them talk of giving in. They scorn the idea. . . .

'I enclose two letters from poor Mat Griffith which may interest you. I had heard her lamentations so often that I could not help writing her a letter of congratulation when the President's proclamation came out. I find that everybody here knows and esteems her. The Fields and Emersons talked with great regard of her. . . .

'Do you know *Train?* The humbug has come back, and is addressing enthusiastic audiences of two thousand people *against* abolition. The fellow reviled Boston's best men—Tremont, Sumner, and Phillips—and the ruffians cheered him to the top of their bent. When you cite the fact to people as a curious phenomenon and an evidence of division they merely shrug their shoulders and say it means nothing. In fact, there are two stereotyped phrases: (1) "You do not understand the Americans," and (2) "I guess we shall come out all right in the end." . . .

'As for news about the army, you in England know just as much of it as we do here.'

Enclosure No. 1 in the foregoing:

'CONCORD, MASS., *Sept. 25th, 1862, Thursday Morning.*

'Frederick Lehmann, Esq.

'DEAR SIR,—I am very happy to hear from Mr Chambers, and it will give me great pleasure to see one so nearly allied to him as yourself. I am at this moment confined at home by a sprained foot, or I should go into the city to-day to fetch you. Meantime, my house is but an hour's ride from Boston by the Fitchburg Railroad, and if you will take the eleven o'clock A.M. train on Saturday we will show you our little village, give you a country dinner, thank you heartily for all the good news you shall bring us of Mr Chambers; and, if you cannot face a Sunday in the country, there is an evening train to the city at 6.30 P.M.

'Pray let me expect you.—Respectfully,

'R. W. EMERSON.'

(To be concluded.)

A PAWN IN THE GAME.

CHAPTER XXVIII.—THE WRECK.

THE groaning timbers of the ship were an expressive proof of the truth of Grant's forecast. The ship's head was working itself deep in the sand, while the fierce seas strained the hull till every plank in it stretched and creaked. An hour later, with a harsh sound of rending timbers, the after-part, on which Jack and Grant stood, rolled to leeward and then settled down. The shock well-nigh threw the two men into the sea. The next wave broke through the torn side of the unfortunate ship, and a sound as of thunder swept through the deck under their feet, while a white geyser of spray shot up from the companion-way.

'The poor old *Sylph* has broken her back,' said Grant ruefully, 'and we must go.' He had been watching the wild sea and the shaking hull with

steady eyes. 'If we wait till the hull breaks up,' he said, 'we shall be caught and crushed in the timbers.'

His alert brain had a plan all ready. A long spar—a spare foretopsail-yard—had been lashed under the lee of the bulwark; and though the bulwark itself had gone, the spar still remained lashed to the stanchions.

'Come,' said Grant, 'we must get afloat on this, and the waves will take us ashore. It is a queer horse to ride,' he added with a cheerful grin, 'but it will carry us ashore.'

With nimble fingers, while Jack helped him, he cast loose the lashings, fixed a long bight of rope in the eyelet-hole in the band of iron that ran round the spar, and then explained his plan.

'We'll launch it overboard with the next big wave, and hang on to it.'

He spoke in a tone which seemed to imply this was an ordinary and daily operation. So alert and cool was his air that a sense of the humour of it touched Jack even in that wild scene.

'You seem to be quite at home in a wreck,' he said.

'Well, I have gone ashore three times and been burnt out once, and I have discovered that it takes a good deal to drown a man who doesn't mean to be drowned.'

While he spoke Grant was watching keenly the run of the waves. One at that moment took shape to windward that seemed likely to serve his purpose. With quick decision he cast the last rope loose, and swung the spar round, holding on to it as it shot down the slanting deck into the sea by the long bight that ran through the eyelet-hole.

Without a moment's hesitation the cool seaman leaped into the hell of waters. 'Come on,' he shouted as he sprang. Jack followed with a leap as daring, and the next moment the breaking waves swept in thunder over him. When he emerged from its strangling depths he found Grant, with his arm over the spar and his face as cheerful as ever, looking round to discover him, the white teeth shining through his smiling lips.

A few strokes took Jack to the spar. It was clear at once that the waves were sweeping them steadily towards the land. If they had clung to the spar itself as it rolled, it would have crushed or drowned them, but the long bight of rope was their safety. They could push themselves free from the spar when its roll was dangerous, and then draw themselves to it again when the wave had swept past. As they drifted near the shore the sea grew more difficult, and the waves broke confusedly. There were no rocks, but the seas ran up the slope of sand with furious speed, and swept back in tremendous reflux; and where the rush and the reflux met were a thousand whirling eddies.

It was for long minutes a desperate fight for life. At the moment when Jack's strength had almost failed a bigger wave than usual came up in thunder and foam. It swept over him, and he felt himself helpless as a wisp of seaweed in the hurrying waters. He was flung on the spar. The bone of his arm snapped. Then he found himself lying half-strangled on the wet sand, while the wave retreated in thunder behind him.

He struggled to his feet. Grant was standing knee-deep in the backward-swinging wave, squeezing the water out of his dripping hair. He smiled cheerfully at his comrade.

'Thank God,' he cried, '*that* is over!'

But Jack was past the smiling-point. He staggered when he tried to stand; his left arm hung like a broken stick; he breathed with difficulty. With a look of concern, Grant hurried to his side and helped him up the slope. They stood—a melancholy-looking pair, ragged, wet, bruised—on a strange shore, without food or weapons; but Grant's spirit was unquenched.

'Thank God,' he repeated cheerfully, 'we've come through *that*!' and he flung his hand with a gesture of triumph towards the sea, as if towards a beaten foe.

Then he turned to his comrade and examined his arm. He handled it with a skill and tenderness which astonished Jack.

'A sailor has queer jobs at times, and I have mended everything from a broken topmast to a broken leg. It seems a clean snap, and I think I can put the ends together.'

He made Jack sit on a tuft of grass under the lee of a sand hummock, searched along the beach till he found some fragments of a broken box thrown up by the waves, produced that unfailing companion of a sailor, a stout knife, and whittled the board into a pair of decent splints. He tore the lining of his coat into strips, with an adroit and sudden pull put the ends of the broken bone together, and then bound the splints cleverly into place. Another strip of his coat bound the arm to Jack's breast so that it could not swing loose.

'Grant,' he said in grateful tones, 'you did that cleverly; but,' he added with a rueful laugh, 'you did it as though you enjoyed it.'

For once Grant's face fell. 'Did you really think that? I am sorry enough for your broken bone, but I *am* glad I could help to mend it.'

And Jack forgave him his untimely cheerfulness.

The two men looked round and commenced to talk of their plans.

'You must sit here,' said Grant with decision. 'I will go aloft,' pointing to the cliffs, 'and see what sort of landfall we have made.'

Jack watched his alert and vigorous figure as he climbed with a seaman's nimbleness the face of the cliff. What exhaustless resource and hardihood the man possessed! He was a true type of the seaman of his day, as familiar with storms as a sea-bird, and as fearless of them; as much at home on the sea as if he had been web-footed; of exhaustless resource, with a courage that no perils could daunt, and a patience that no hardships could destroy. And from what inner spiritual fountain did he draw

that gay cheerfulness? Jack thanked God for such a comrade.

Meanwhile Grant stood on the edge of the cliff, shading his eyes with his hand and searching the whole landscape. Presently, with a shake of his head, he turned round; but even as he turned something caught his eye. He looked long and steadily, then came leaping down the cliff.

'It is a bad anchorage,' he explained; 'all sand and emptiness, not a tree or house-roof in sight. But there is a queer craft showing—a camel with an Arab on his hump. He caught a sight of me, I suspect, and he will show his dirty face over the cliff presently.'

Nothing could be done but to wait events, and the two men stood watching the edge of the cliff. Suddenly the curved nose, the arrested legs, the swinging neck of a camel showed above the cliff. Its rider was a Bedouin. His straight black hair was bound with a dirty rag; his face was lean and dark; the wind blew back his rags as he leaned over the edge of the cliff. He looked first at the wreck, then his keen eyes searched the sands. They fell upon the figures of Jack and Grant. He stared at them long and fiercely, plainly taking in their whole story. Then he flung up his hand, wheeled his camel, and vanished.

'He is gone to fetch his family,' said Grant; 'and queer visitors they will be.'

'We have nothing to fear. They may make us prisoners and demand ransom for us; but our lives ought to be safe, and we shall get what we want—food and shelter.'

Grant looked at his companion. He was faint with the buffeting of the waves and the pain of his broken arm.

'There is no reckoning what those beggars will do; but any port in a storm;' and he began whistling, as he kicked up the sand with his feet. Waiting, it was clear, was more trying to the resolute seaman than action.

'Where do you think we are?' asked Jack.

'The old man thought he was somewhere off Acre, but by my reckoning we are a hundred and fifty miles farther south.'

'That is bad navigation,' said Jack grimly.

'Well, when you take your observations through the bottom of a rum-bottle you may easily be a good many degrees out.'

Just then some movement on the top of the cliff drew their eyes.

'Here comes the menagerie,' said Grant.

An irregular frieze of fierce, dark faces, bearded and scowling, was looking down on them from the edge of the cliff. The figures were ragged and wild, and plainly carried guns. The lean countenances were pitiless.

'These scarecrows,' was Grant's comment, 'must have looted a dozen old-clothes shops for their wardrobes.'

The heads came and went above the edge of the cliff in agitated fashion, but their owners did not seem inclined to descend. A wild figure, his rags streaming out level in the wind, came for a moment to the edge of the cliff—his thin legs looking like sticks—and screamed out some message; but the gale blew away the syllables as he uttered them.

'It is no use hailing us from the topmast, old fellow, in that fashion,' said Grant. 'If they won't come down we must go up.' He turned and looked at his comrade. 'You can't come; but I know something of their lingo, and I will go;' and he started to his feet.

'Do not go, Grant; let us wait till they come,' urged Jack.

'We must get it over, and you must get food and shelter. I am not ugly enough to frighten them;' and, with a cheerful laugh, he set out briskly towards the cliff. Almost at his first step upward the line of lean, dark faces suddenly vanished behind the rocky crest, and Grant laughed afresh as he noted it. 'That is the disappearing trick,' he cried.

'I can see the muzzles of muskets,' said Jack in a warning voice; but, with a careless wave of his hand, the hardy seaman pressed on. He looked back once, and Jack could see the smile on his face.

Just then from the rock above flashed a point of red flame; a puff of blue smoke was visible and went whirling to leeward. It was a musket-shot. Grant stopped suddenly, threw up his arms, made a few uncertain, staggering steps, and fell on his face. Jack started to his feet and ran stumblingly forward to the fallen man. When he reached him the blood was running fast from his mouth, and life was visibly running out with that red stream.

'Oh Grant!' he cried in deepest distress, as he tried with his one uninjured arm to lift the poor fellow's head. The dying man looked up. Jack had torn open his shirt. The shot which had pierced Grant's breast was plainly jagged and of heavy calibre. Jack could do nothing. He wiped the blood that ran red and hot from his dying comrade's lips. As he did so Grant opened his eyes. The fire of courage in them was unquenched. An odd smile crept to his lips.

'I am in port first,' he whispered, and with a strangling sob, a sudden twitch of all his limbs, his life passed away.

(To be continued.)

WATER PURIFICATION.

AMONG the many achievements of modern hygienic science there are none more notable than those relating to the mitigation of disease caused by the drinking of impure water.

The dire possibilities of water for human consumption containing pathogenic germs have caused attention to be more and more closely given during the past generation to the general provision of ample supplies for domestic use which shall not only be free from contamination with germ-laden liquid, but which shall also practically contain no matter in suspension. A further desideratum in certain instances is the elimination of the unpleasant, though innocuous, tint arising from the peaty matter so frequently present in surface supplies.

The building up of large centres of population in recent times has undoubtedly aggravated the question of providing adequate and pure water-supplies, and drawn increasing attention to the subject. In a limited number of cases the natural supply from lake or reservoir is sufficiently pure for direct consumption; but in most instances the application of mechanical or chemical science, or a combination of both, is essential. Mechanical filtration through beds of sand is one of the oldest means of effecting the necessary purification, and in certain cases, under suitable conditions and care, affords excellent results. More recently 'intensive' working has largely come to the front, and the high mechanical efficiency and output of the many modern water-purification and filtration plants mark a great advance on former practice.

In both the slower sand filtration and more rapid mechanical filter methods, however, chemical science has come to the aid of the engineer, and not only largely facilitated his work, but rendered possible the achievement of results hitherto unattainable. The 'life' of a sand filter-bed and its efficiency are, it is now generally recognised, greatly increased by the preliminary elimination of the major part of the suspended impurities contained in the water under treatment. To effect this removal the well-known properties of hydrated alumina precipitated *in situ* are utilised. In the East, for centuries, alum has been in common use for the clarifying of water, and is capable in itself of effecting such efficient purification that subsequent filtration is at times almost a work of supererogation. Properly applied, alum (or rather its active constituent, sulphate of alumina), when decomposed by the bicarbonate of lime contained in nearly all waters, precipitates insoluble hydrate of alumina in a gelatinous form, which enmeshes, entangles, and carries down bacterial and suspended matter alike, leaving the purified water brilliantly clear. Further, not only is there a very remarkable diminution of germ-life and mechanical impurity, but the precipitated alumina, exerting its well-known action as a mordant or colour precipitant, also removes the objectionable yellow or brown colouration of peaty or surface waters which so frequently detracts from the appearance of otherwise suitable supplies.

As alum is expensive, and, moreover, leaves a little potash or ammonia sulphate in the treated water, the alumina compound most generally used in the purification of potable and other waters is that known as aluminoferric, a very cheap and efficient form of sulphate of alumina, containing nearly 50 per cent. of that substance and a small proportion of iron sulphate. Strength for strength, it is only one-third the price of alum. Although meeting at first the prejudice of ignorance, and having slowly to overcome the rooted objection to the use of any chemical, however innocuous and however completely eliminated from the treated water, aluminoferric is now in use the world over. It is important to know that it leaves no ingredient in the treated water which was not previously present; the only change being that the 'temporary' hardness is to a slight extent converted into 'permanent' hardness, a property possessed by most of the world's natural pure water-supplies.

So far back as 1881 the water-supply for Bolton, in Lancashire, a reservoir containing some seventy million gallons of water so turbid from unsettleable micaceous clay as to be highly objectionable, was treated at the intake at the rate of one and a half grains aluminoferric per gallon, and rendered perfectly clear and colourless.

In a recent case of another English reservoir, the presence in the water of light suspended matter, and also of the yellowish-brown tint above referred to, caused serious objection to be taken to its consumption for domestic purposes. The water had, further, a slightly acid reaction, due to humic or other organic acids of vegetable origin. As it was desirable to purify the large body of liquid already in the reservoir, a raft capable of carrying a man and a couple of large barrels was put together. One of the barrels was filled with a dilute solution of sulphate of alumina, and the other with whiting (chalk) in suspension in water. Suitable perforated distributors at both ends discharged a continuous outflow of the reagents; and the raft, which itself provided sufficient agitation to mix them, was pulled from side to side, gradually traversing the whole area. The result was a complete success, the whole body of water—in places eighteen to twenty feet deep—being purified and decolourised. Arrangements were then made for dealing with the inflowing water on similar lines. In another case, where the impure water has the dangerous property of vigorously attacking lead pipes, this serious development has been counteracted by adding chalk along with the aluminoferric.

Aluminoferric has in recent years been increasingly adopted for the purification and clarifying of large water-supplies abroad. In South America, where the water from the River Plate is often highly charged with light suspended matter, &c., it has been employed on a very large scale for years with satisfactory results. This has also been done in India, South Africa, and other tropical regions.

Some interesting results were recently published in connection with the purifying of the Nile water for the Alexandria water-supply, showing the great utility of sulphate of alumina in the preliminary purification. In this case the installation is on chemical precipitation lines, followed by treatment in one of the most efficient and advanced installations of rapid mechanical filtration. As Nile water offers considerable difficulty on account of the presence of very fine particles of clay, chemical precipitation was found essential to coagulate the suspended matter and thus enable the greater proportion of it to be sedimented in subsidence basins before passing to the filters.

Sulphate of alumina is usually employed at the rate of about one and a half grains per gallon; and the results, both from the appearance and bacteriological condition, are excellent. The use of alumina as a coagulant is now regarded as an essential in the majority of rapid filtration-plants dealing with water containing matter difficult to sediment. In certain cases the precipitant is applied to the water as it passes to the filter; in others, as above mentioned, the bulk of the precipitate is settled out first.

The germicidal effect of light on bacterial life in water has perhaps, as pointed out by Professor Frankland, at times been exaggerated; but there is evidence beyond question of the beneficial effect of the percolation of light through water-areas. The extent to which the light can penetrate depends very largely on the clearness or otherwise of the water; and from this aspect the use of aluminoferric, resulting as it does in the production of brilliantly clear water, has a most important bearing on the question of water purification and storage.

Professor Frankland (*Micro-Organisms in Water*, 1894, page 388), after reviewing the work of a considerable number of experimenters on the action of light on micro-organisms under varying conditions, summarises the results obtained, and states: 'There is no question that light, and more especially sunlight, has a deleterious effect on bacteria in their vegetative, and to a less extent in their spore, forms. This has been established not only by Downes and Blunt's original experiments on casual mixtures of micro-organisms, but also by numerous experiments in which pure cultivations of the most diverse microbes have been employed. This deleterious effect can be produced by light, irrespectively of the rise in temperature which must accompany direct insolation unless special precautions be taken. It is, moreover, the most highly refrangible rays of the spectrum that are the most injurious to bacterial life, the ultra-violet being the most, and the infra-red the least, powerful in this respect, a circumstance which clearly indicates that the phenomenon is due to chemical action. In its special connection with the bacteriology of water, we must, therefore, recognise in sunshine, and to a slight extent also in diffused daylight, a powerful bactericidal agency, but one the importance of which there has been a considerable tendency to magnify and exaggerate.'

The extent to which precipitated hydrated alumina is capable of entangling and carrying down micro-organisms is remarkable, and careful laboratory results have conclusively shown that from 80 to 95 per cent. of the bacteria present may be precipitated by the use of from two to five grains of alumina sulphate per gallon.

When it is borne in mind that the number of pathogenic germs per unit volume in a given water-supply, rather than their mere isolated presence in insignificant amount, is the determining factor in the safety or otherwise of the water from the point of view of human consumption, the elimination of a high proportion of the total organisms present is of paramount importance. Remembering the fearful toll that has been paid in the past by our armies abroad, our travellers, and 'the bearers of the white man's burden' to dysentery and other tropical diseases, the fact that such plagues are preventable by the adoption of rational and proved means for the supply of wholesome potable water cannot be too widely disseminated.

THE LONDON OF 'ESMOND' AND 'THE VIRGINIANS.'

PART II.

DICK STEELE and Joseph Addison, just mentioned in the passage quoted from *The Four Georges*, appear frequently in *Esmond*. Steele met Esmond for the first time when Harry was a child at Castlewood and the author was a soldier in the Life Guards. It was years later when Thackeray's hero met the gentleman whom Pope satirised as Atticus. Esmond, after dining with Dick Steele at the Guard-table at St James's Palace, and having left early one sunny afternoon, when his host had by chance a sober fit, in walking down the street was surprised when his companion suddenly left his arm and ran after a gentleman who was poring over a folio volume at the book-shop near to St James's Church. The tall, fair man in a snuff-coloured suit, with a plain sword, very sober and almost shabby in

appearance—at least, when compared with Captain Steele, who loved to adorn his jolly, round person with the finest of clothes, and shone in scarlet and gold lace—was no less a person than Mr Joseph Addison, who took them both to his lodgings in the Haymarket, and gave them a bottle of wine, invited Harry to give him some particulars of Marlborough's action for use in *The Campaign*, upon the writing of which he was then engaged, and subsequently read them the portion already composed.

At the Court end of the town, north of St James's, lies Mayfair. There, in Bond Street, stayed Mr Harry Warrington in lodgings, the landlord of which was Mr Ruff, the head-waiter and aide-de-camp of Mr Mackreth, the proprietor of White's Club. It was by the advice of his fashionable friends who introduced him to White's that the 'Fortunate Youth' moved westward from his quarters at the Bedford Coffee-House in Covent Garden. In Hill Street, close by, lived Harry's uncle, Sir Miles Warrington; and also the best friends a man could desire, Major-General and Mrs Lambert, and their children, Theo and Hetty. In Hill Street for a time stayed Mr Redmond Barry, afterwards known as Mr Barry Lyndon, when he was forcing his addresses upon Honoria, Countess of Lyndon, who had a house in Berkeley Square. Hill Street figures largely in many of Thackeray's books, and it is the great Gaunt Street of *Vanity Fair*, where lived Lady Gaunt's mother and Sir Pitt Crawley, to the latter of whom Becky went as governess. Who does not remember her arrival there from the Sedleys' house in Russell Square? 'Having passed through Shiverley Square into Great Gaunt Street, the carriage at length stopped at a tall, gloomy house between two other tall, gloomy houses, each with the hatchment over the middle drawing-room window; as is the custom of houses in Great Gaunt Street, in which gloomy locality death seems to reign perpetual.' Shiverley Square, also called by Thackeray Gaunt Square, is Berkeley Square, in which is situated Gaunt House, once the residence of the Most Honourable George Gustavus, Marquis of Steyne. 'Gaunt House occupies nearly a side of the Square. The remaining three sides are composed of mansions that have passed away into dowagerism—tall, dark houses, with window-frames of stone, or picked out in a lighter red. Little light seems to be behind those lean, comfortless casements now; and hospitality to have passed away from their doors as much as the laced lacqueys and link-boys of old times who used to put out their torches with the blank iron extinguishers that still flank the lamp over the steps. The Square has a dreary look; nor is my Lord Steyne's palace less dreary. All I have ever seen of it is the vast wall in front, with the rustic columns at the great gates, through which an old porter peers, with a fat and gloomy red face, and over the wall the garret and bedroom windows, and the chimney out of which there seldom comes any smoke now.'

In Clarges Street Barry Lyndon's father lived in the day of his splendour; and there, too, Beatrix, Baroness Bernstein (*née* Castlewood), held her card-parties, her Wednesday and Sunday evenings, save during the short season when Ranelagh was open on a Sunday, where the desolate old woman sat alone, waiting hopelessly for the scapegrace nephew that her battered old heart had learned to love. The whirligig of time had brought its revenge, and the once beautiful Beatrix, who scorned the love of honest men, who schemed to become a duchess, who intrigued to marry a prince, and contented herself with becoming his mistress—the lovely, wayward Trixie—was left in her old age to hunger for love that was now denied her. We know she was heartless, we know she was cruel, but, such is man's nature, he forgives her all because of her marvellous charm, and gives her the pity that she would have refused with scorn.

Ranelagh, with its Rotunda, was a great resort alike of the *monde* and the *demi-monde*. Harry Warrington took his brother there, and heard for the first time a full orchestra and a piece of Mr Handel's satisfactorily performed. Vauxhall Gardens, with its 'twenty thousand *additional* lamps' lighted every night, was quite as well known, and in later years was honoured by a visit from Mr Arthur Pendennis of the Temple, the author of *Walter Lorraine*, a novel that enjoyed some favour in its time, who was fortunate enough to rescue beauty in distress in the person of Miss Fanny Bolton, who with her mother kept the lodge at Shepherd's Inn. Marylebone Gardens was a third place of amusement, and there was also an entertainment at Sadler's Wells, Islington, where at one time the attractions were 'the most singular kind of diversion on eight hand-bells by Mr Franklin, as well as the surprising performances of Signora Catterina.' Gaming, however, was the fashionable enjoyment of the upper classes. Those who were fond of books read them in secret, for all the world as if reading were a vice. 'Books! Prithee, don't talk to me about books,' said Sarah, Duchess of Marlborough. 'The only books I know are men and cards.' The king in state played hazard with the nobility on Twelfth-Day for the benefit of the groom-porter, and even clergymen did not look unkindly at the practice. Gentlemen lost and won thousands at a sitting; it is said that Lord Steyne won his marquisate at the gaming-table. Many after running through their patrimony found their way to the sponging-houses in Cursitor Street, *en route* to the debtors' prisons of the Fleet, King's Bench, and the Marshalsea. Some of the earthenware pots who tried to go down-stream with the iron pots eventually found themselves at Newgate or at Tyburn. An admirable picture of the gambling set may be found in the earlier part of *The Virginians*, and, for those who prefer history at first hand, in the letters of George Selwyn and Horace Walpole.

The western boundary of Mayfair is Hyde Park.

This was the scene of many duels. The Duke of Grafton went out in 1685, and killed the Hon. John Talbot; and in the eighteenth century John Wilkes, Lord Thurston, Charles James Fox, Colonel Fullerton, and many others took the ground. In 1812 the Duke of Hamilton met Lord Mohun (Charles, not Henry, as Thackeray christened him). They fought near Price's Lodge just before sunset, and both died on the ground. The Duke killed his antagonist, but there is some doubt as to how the Duke was killed. It was said at the time that Colonel Macartney, Mohun's second, came up after Mohun fell and stabbed the Duke in the back. Thackeray was wrong in saying in *Esmond*, where the story of the duel is recorded at length, that Macartney fled and never returned to England; for though the homicide fled, after four years he returned, was tried by the Court of King's Bench, and acquitted.

Readers of *Esmond* will remember that the duel, which arose out of a quarrel concerning property, took place on the eve of the marriage of the Duke to Beatrix Castlewood. Lord Mohun was a notorious character. In earlier days he had been concerned with Lord Warwick, the husband of the countess whom Addison married, in the murder of Will Mountford the comedian, and for this offence the noblemen were tried by their peers and acquitted. Thackeray makes Mohun kill Lord Castlewood in a duel in Leicester Fields, now Leicester Square, where, on the north side, stood Leicester House, built early in the seventeenth century by the then Earl of Leicester. Leicester House was purchased for George II. when Prince of Wales, and it was not until 1766 that it ceased to be a royal residence. The Empire Theatre now occupies the site of the mansion. A third spot favoured by duellists was the ground behind Montague House, and here the father of Barry Lyndon pinked Count Tiercelin.

Much of the action of *Esmond* took place in Kensington. 'In those days,' Mrs Ritchie, the authoress of the charming *Old Kensington*, says, 'the hawthorn spread across the fields and market-gardens that lay between Kensington and the river. Lanes ran to Chelsea, to Fulham, to North End, where Richardson once lived and wrote in his garden-house. The mist of the great city hid the horizon and dulled the sound of the advancing multitude; but close at hand . . . were country corners untouched—blossoms instead of bricks in spring-time, summer shade in summer.' When the father of Rachel, Lady Castlewood, died and left her some three thousand pounds, with this little fortune she was enabled, when her daughter's time as Maid of Honour at Court came, to come to London, where she took a small, genteel house at Kensington Square. This was adjacent to the Court. The red-brick Kensington Palace, built by William and Mary, was the social headquarters of the Court, though State ceremonies still took place at St James's Palace, and in summer Majesty migrated to Hampton Court or Windsor.

Kensington Square was commenced in the reign of James II., and was finished towards the close of that of William. In the time of Queen Anne and the first Georges it was very fashionable; and, owing to its proximity to the Court, lodgings were so much in demand that an ambassador, a bishop, and a physician occupied apartments in the same house. Talleyrand lived there, and Mrs Scurlock, whom Steele married, and Addison before his grand, miserable marriage with the *châtelaine* of Holland House; while Nos. 10 and 11 were reserved for the Maids of Honour who could not be housed at the palace.

When Lady Castlewood moved to Kensington, Esmond, so as to be near his 'dear lady,' took lodgings at Knightsbridge, spelt Knyghtbrigg, then a hamlet in the parishes of Chelsea, Kensington, and St Margaret's, Westminster, 'between London and Kensington, and overlooking the gardens.' It was some distance from London, and so late as 1740 the Bristol mail was robbed there. The house in Kensington Square had been in the early years of the eighteenth century the residence of the Marquis of Powis, who accompanied James II. into exile, and by the grateful monarch was created Duke of Powis, a title now extinct. It then had stabling and a cottage attached to it. Upon the site of the cottage was built the house in Young Street, 'Our Street,' where Thackeray lived from 1846 to 1853, and where he wrote *Vanity Fair*, *The History of Pendennis*, and *Esmond*. The old 'Greyhound,' since rebuilt, with its memories of Pope, Addison, and Macaulay, was at the corner opposite. It was from here that on an eventful night Esmond watched the door of Lady Castlewood's residence lest the Prince should escape from it. It was at the 'King's Arms,' Kensington, that Esmond enrolled a little army of gentlemen to enforce the Pretender's claim to the throne. They assembled, in parties of two and three, to the number of fifty-three, and his Grace the Duke of Ormonde was to take command. But when the moment for action came the Prince was absent at Castlewood paying his court to Beatrix. So ended the conspiracy which might have altered the history of England by restoring the Stuarts to the throne.

It was to Lady Castlewood's that the Pretender came *incognito*, and from there was taken to see his sister the Queen, when she and her favourite lady-in-waiting were taking the air in the cedar-walk behind the new banqueting-house; and it was there that Esmond warned the Prince that if the latter harboured thoughts of dishonour towards Beatrix he would call in the watchman and give him up. The windows of the house were open both towards the gardens and the square; in the square was the watchman, who would be glad to secure the five hundred pounds set on the Pretender's head, and in the gardens was the palace where the Prince might hope to reign. He hesitated, and then pledged his word. He broke faith and went to Castlewood, and by so doing lost a throne. It was also at the house

in Kensington Square that the Duke of Hamilton wooed and won Beatrix; and it was in the drawing-room that he objected to Esmond, whom he believed to be a bastard, giving his future wife a grand parure of diamonds as a wedding-gift. This led up to one of the greatest scenes in the book—a scene which shows Thackeray's genius at its best—when Lady Castlewood, pale, trembling, and indignant, tells the story of the noble gentleman's renunciation:

'My daughter may receive presents from the head of our house; my daughter may thankfully take kindness from her father's, her mother's, her brother's dearest friend; and be grateful for one more benefit besides the thousands that we owe him. What is a string of diamonds compared to that affection he has given us—our dearest preserver and benefactor? We owe him, not only Frank's life, but our all—yes, our all. The title we bear is his, if he would claim it. 'Tis we who have no right to our name; not he, that is too great for it. He sacrificed his name at my dying lord's bedside—sacrificed it to my orphan children; gave up rank and honour because he loved us so nobly. His father was Viscount of Castlewood and Marquis of Esmond before him, and he is his father's lawful son and true heir, and we are the recipients of his bounty, and he the chief of a house that's as old as your own. And if he is content to forgo his name that my child may bear it, we love him and honour him and bless him, under whatever name he bears.'

MARY THE MOTHER.

IT will probably be allowed that the medical man sees more of human nature stripped of all convention than any one else. Under sharp or long-continued pain, or with certain death standing as it were at the foot of the bed, men and women, as a rule, drop any mask or domino they have worn. Naked they came into the world, and naked they go out of it. Sometimes one leaves the still body feeling cynical, sometimes feeling sad. A young girl faces death with patience and a quiet smile. An old man goes whimpering away. Friends and relatives give themselves devotedly to the problem of saving a life or smoothing the way through the Valley of the Shadow, or they look on with frank indifference, grudging all labour and hoping for a speedy end.

One or two of my cases will interest you, if I tell of them properly; and Mary the Mother's is the first.

It was in December that Hector Og the elder came down from the hills, twenty miles through the snow, to tell me that Hector the younger was ill. I left him to walk back as he had come; and, riding the first ten miles, I stabled my horse, borrowed a stout stick, and at last reached the sheiling where Hector the younger lay groaning for me.

The little croft, with its high deer-fence, stands far up the brae above the river, six or seven miles in a bee-line from any other dwelling. Long before I reached the door I could see a gray figure watching me through a glass, and this was Mary the Mother.

She was elderly, thin, gray, hard-featured, taciturn. She knelt at my feet, in spite of my remonstrances, and took off my snow-covered gaiters. Her hands were trembling, but her voice and manner were quiet almost to dullness, and she pressed me to 'taste,' or rather she attempted to press me, before taking me to the bedside.

I will not harrow you with details of young Hector's condition; but an immediate operation was undoubtedly necessary, and his nerve had gone through pain and several sleepless nights. He must keep still while I worked, and he would never do that unless he were chloroformed. I could not wait for skilled help, and I could not by any possibility get him to it across seven burns and ten miles of snow-covered heather down to the road.

I took Mary into the other room, where a big peat-fire smouldered on the open hearth, and I told her how things were, and what must be done.

I cannot quote her reply word for word, but it was very short and very much to the point. If I would do my duty, she suggested, she would do hers, which she conceived to lie in obeying my orders.

I considered her much-wrinkled face and her steady gray eyes, and I decided that without doubt here was a woman to be depended upon. So we returned to the bed, and Hector the younger agreed to allow anything and everything that would be likely to give him peace.

I chloroformed him, and when he was well under I handed the towel and the bottle to Mary, and did my work while she used them according to my orders.

When everything was done I was very hot and tired, and Mary was gray-faced and cold and trembling. I took her and made her lie down and drink some of the whisky she had offered me; while, to her horror, Hector the younger, drunk with the chloroform through which he was groping his way back to consciousness, cursed me body and soul from the bed, declaring that I had gutted him like a haddie, and now had better finish the job and hang him like a haddie upon the wall. Poor Mary's wrath at his ingratitude brought the colour back to her cheeks quicker than the spirits did; and when Hector Og tramped in, as he did not long after, he

found his son lying quiet, while Mary served me by the peat-fire in the next room with tea and scones, fresh-butter, and home-made black-currant and bramble jam.

Then Hector Og, over sixty years old, but nothing daunted by the forty miles he had done that day, started away with me and convoyed me two or three miles on my homeward journey. His two collies escorted us; and Mary, surrounded by three or four terriers, watched us from the door.

Well, things did not go smoothly for some time with Hector the younger. It was hard work to reach him at all, and impossible to dress his wounds as often as would have been advisable. Once I was sent for late in the day, and reached the half-way house, ten miles from Hector's bed and ten from my own, determined to go no farther till daylight. But there was Hector Og with a lantern and his two collies.

The old man begged and prayed that I would get on. 'If you'll step outside,' I remember he said with splendid mendacity, 'you'll hear him roarin' down the strath;' and I was shamed into taking as eerie a tramp as I ever made, ten miles over deep snow, never seeing farther ahead than the light of the lantern went, and with not a sign of life all the way, but the tracks of grouse and hares and of a herd or two of deer.

I drank tea that night made with peaty water, I slept between peaty sheets, I washed in peaty water and drank peaty tea again in the morning, and I have never liked peat-reek since; but Mary waited upon me with the greatest care, and her eyes and acts said more than her words when she thanked me for coming.

Snow lay long on the hills that winter, and another of my visits was made through a blizzard. My horse fell upon ice blown bare of snow, so I had walked some miles before I left the road, and bent my head against the drifting, whirling snowflakes. It was a tough job that afternoon. The wind and the snow stung and dazzled me; the big drifts tired me. I remember I lay in a drift some hundred yards from the cottage, yelling for some one to come and haul me out. But no one heard, and no one came, so at last I shoved through, and staggered into the cottage alone.

I remember how angry Mary was to find that no one had met me, and how she muttered over me as she knelt and took off my boots and gaiters, while I sat dumb and indifferent; and how she scolded Hector Og and Alastair, the younger son, when they came in with the collies from gathering the sheep into their stone-built circular shelters. I remember, too, that evening, when I had attended to Hector the younger, how good it was to sit before a big fire blazing up the wide chimney, though there were six dogs with whom to dispute precedence. Two keepers searched the hills that night for me, thinking me lost; but I slept cosily, disturbed only by the pig, who, as Mary apologetically explained next morning, 'thocht she didna get justice,' and, squealing for admittance, roused all six dogs to an uproar in the small hours.

It was now well on in January. Hector the younger was making progress, and the snow was not so deep. We began to discuss the possibility of getting him down to the low ground, where I could see him more often, with less toil to me and less expense to them. The two Hectors doubted and disputed, but Mary backed all my arguments. From the day we had first met she and I had given our confidence to one another, and in her eyes whatever the doctor did or said was right.

So one afternoon a cart rumbled down the main street of our village over the snow. Hector the younger lay bundled in the straw, Hector Og strode at the horse's head, and Mary followed behind, where she could watch Hector the younger, whom she alternately scolded and encouraged. Hector Og returned with his cart to the lonely hills next day; but Hector the younger and his mother lodged in the village, and I saw my patient daily. I saw his mother too, of course; but I hardly looked at her, she was so silent, so ready, so inconspicuous. When I wanted her she was at my elbow, but never in the way. Four or five days after they came down from the hills I looked her straight in the face while asking some question, and it occurred to me that she was grayer than ever.

'Are you well?' I asked.

'Only tired,' she said, and would not talk of herself further, or let me touch her wrist.

I ordered her to lie down for the rest of the day, and she went off obediently to her bed; but the next morning when I called she was at young Hector's side. She persisted that there was nothing wrong, and I—well, I practically thought no more of it.

So the days went by, with Hector still abed but always getting stronger, and Mary always at his side.

Then one afternoon I had a fright. An urgent message came for me to go over at once.

'What's happened to him?' I asked while thrusting into my overcoat.

'It's Mary that's bad,' the messenger said, and I hurried more than ever.

I found her still at her post. She was sitting near Hector's bed, silent, rigid, with folded hands, blue-gray about the tight lips, and with dark shadows about the steady gray eyes. We helped her to her bed, where she died that night in my arms, apologising for the trouble she thought she was causing, and for the little moan which pain at the heart wrung from her now and again.

'Surely that pain didn't begin to-day?' I whispered once to her.

'It's ever there since I travelled [walked] from the hill,' she gasped back. 'But I was feared if I let on you'd keep me from my boy.'

And so Mary died.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

IT seems to be a general feeling that this Parliament—whatever its merits, of which it has many—has made few great reputations. More may have been injured than improved, and indeed the circumstances of Liberal statesmanship in these days are such that this must almost inevitably be the case. Youth and ability may be given early opportunities in these ranks, and it may be less difficult for an aspirant to come out of 'the ruck' than it is on the other side; but when it is the matter of great advancement it is not the same. The way to political greatness through the Liberal medium is difficult. Antagonists are the most numerous, the most bitter, and the most powerful, and too often has the statesman in the prosecution of his ideal and his ambition to risk almost everything on a single plunge. Faults do not seem to be condoned and forgotten on this side of the House as elsewhere. Therefore it must not be set against this Parliament if, as we say, few great reputations have been made in it on the side of the majority. But at all events it is admitted by friends and foes alike that it has made and established one good statesman, and the very numerous political enemies of Mr David Lloyd-George are those who most willingly and without qualification admit his success and his worthiness. Mr Lloyd-George and Mr Birrell are the two quickest personalities of this administration, and it is perhaps not too much to say that the Welshman is the strongest and most peculiar individuality that we have had since Gladstone. He is one of the few men of a generation from whom magnetic fire of zeal seems to issue at all times. He is enthusiastic, and he is most thorough, and according to his lights he is deeply sincere. A man having these points, you may overlook some faults in him. He is now very different from the man we knew in the reckless parliamentary days of the Boer war, when men's feelings were ablaze and they were little inclined to measure the exact value of the things that they said. Some wise persons shook their heads when they saw that with a Liberal Government this Radical (or Gladstonian-Liberal, as he calls himself) who had helped to make it must achieve an office; but, to their wonder, they see now a sober and most serious statesman who has constructive powers of a most unusual order, whose judgment is excellently balanced, who is remarkably fair-minded, and who is a man of the most penetrating discrimination. He has in a short space of time rendered substantial service to the trade of the country. It sometimes seems to those who try, as it were, to look into the mental mechanism of such men, that Mr Lloyd-George's talents have developed so well on definite lines very largely because he has not permitted himself to be drawn into what we would call the London system. He has insisted on remaining a Welshman in London. It is a mere platitude to say that our great Metropolis is the most inspiring place in the world; but the man does best with it who shows a little contempt for it and its ways. There is a peculiar London poison which works its way into the systems of men of weaker character, and its effect is to destroy native individuality and simple, earnest faith which exalt the genius, and to substitute for it a certain languidness, a strange cunning, and, above all, a most marked opportunism. The result is the naturalised Londoner. Sometimes he 'gets on,' but he rarely shines as a star in the firmament of fame. Most generally he is one of a smug crowd whose lives are led with much comfort and satisfaction to themselves. These, we say, are the naturalised Londoners. The men who go higher are often those from the shires, or Scotland, Ireland, or Wales, who do not permit themselves to become naturalised in this manner. London may make remarks about clothes, may sneer at accents, and may even show irritation at some sort of general gaucherie, but none the less she has the greater respect for those who live with her and use her without surrendering to her influences than she has for the wholly naturalised Londoner. And that, we may fancy, is

 [*All Rights Reserved.*]

one of the secrets of the success of Mr Lloyd-George, for he is more of the Welshman now than when he was born of comparatively humble Welsh parents in Liverpool. He has that peculiar Cymric sharpness of the eye, that sweet silveriness of the voice, and all that subtle native appreciation of dramatic effect in speech that mark the Welshman. In London he identifies himself in the closest manner with all Welsh matters. No community in town is so close and compact as the Welsh, and he is the head of it. The Irish and the Scots are mere disordered wanderers in comparison. These Welsh speak their own language invariably. We have heard Mr Lloyd-George in a company of mixed nationality argue with the generality in English, and in the same breath turn to a Welshman and add a corollary—or even finish a sentence, one sometimes thinks—in Welsh. This is not merely force of habit; all who see know that it is certainly not rudeness. It is the strong Welsh instinct.

* * *

It is but natural, then, that in Wales they regard 'George'—as for the most part they call him—as a hero indeed. As is inevitable, detractors he has in his own country as bitter as those to be found anywhere else; but commonly, and particularly in the fastnesses of the wild Wales, Lloyd-George is a name that is uttered with a soft and reverent affection. Soon after the death of Queen Victoria a Welshman told us what was certainly a true story, something that he had got at first hand from one of those fastnesses. It was the morrow after the great national loss, and two Welshmen of the humblest order were discussing what seemed to them to be the difficulties and peculiarities of the English constitution. 'And who will be queen now, William Williams?' asked one in the measured, clear-cut accents that are of the Welshman. 'Well, indeed, now, it will haff to be a king, isn't it?' was the answer; and after a pause it was added, 'The Prince of Wales, he will be the king.' The first speaker assented, and then set a more difficult interrogatory: 'Yes; but see now, what if there was not this Prince of Wales? Who would be the king then, William Williams? Who would be the king then—or the queen either, William Williams?' Mr Williams, well up in modern history, asserted that in such an event the Prince of Wales, as they referred to him, had a son who would succeed him, and be king. The answer appeared satisfactory; but the questioner seemed confident that there were possible situations for which the constitution was not prepared, if he could but think of them; and at last, with the light of triumph in his eyes, he demanded, 'Ay, but, William Williams, what if there were not that little son, or any other son or relation whateffer? Who is going to be the King of England then?' And Mr Williams agreed that such a situation would present many points of the utmost difficulty; but eventually, as by a sudden inspiration, and in tones of strong conviction such as challenged denial, he declared, 'Well, indeed truth, Lloyd-George would be king!' And at that the matter ended. It was agreed that Mr Lloyd-George would be king, and the people were satisfied. But if one is to tell tales about this young statesman, let us at all events tell the one that is specially authorised, being told by himself to his intimates. Many years ago, in the early nineties, he and the Bishop of St Asaph were engaged in furious controversy upon the subject of Welsh Disestablishment. His following the Bishop about and replying to his speeches in defence of the Church was perhaps Mr Lloyd-George's first *tour de force*. Both men hit hard. Eventually the disestablisher followed the Bishop to Flintshire, where the chairman of his meeting was a Welsh deacon, a man of strong convictions but with no sense of humour. He introduced Mr Lloyd-George to the meeting in the following terms: 'Gentlemen, I haff to introduce to you to-night the member for the Carnarvon Boroughs. He hass come here to reply to what the Bishop of St Asaph said the other night about Welsh Disestablishment. . . . In my opinion, gentlemen, the Bishop of St Asaph iss one of the biggest liars in creashon; but, thank God—yes, thank God—we haff a match for him to-night.'

* * *

Much of the general gossip in these days is of bills—parliamentary bills. It rarely happens that a civilised community that is bent on the achievement of the perfection of life has not one bill of magnificent importance to debate in the halls and the streets and the railway trains, and to write letters to the newspapers about. Such a bill, it may be said, is essential to the maintenance of political activity and good citizenship in the individual. But now there are so many bills! A City man of business seats himself in a train that takes him to and from a suburban home, and having made one general glance over his morning or evening paper, he catches the eye of another who regularly travels in this compartment and talks with him. One asks, 'What do you think of the bill?' to which the other, with some feeling of weariness, responds, 'Which bill?' Is it the Licensing, Education, Finance, Docks, or which? Now, all these various bills are spoken of as if they were the creations of various Ministers of State who bring them first to the notice of an expectant House and country, eager on the one side to give them praise, and on the other side to pour forth against them all the maledictions which are permissible and customary in these cases. The statesman whose name is coupled with the bill is regarded as the author of its every word, and as an archangel or an archfiend as the case may be. Inevitably the gentle and possibly impartial reader of leading articles and parliamentary debates concludes that he is regarded in one or other of these lights. So he is in a very large sense the author, the creator of the bill. The central idea is his; he is the genius who gave it birth. But these men of the Front Bench are not burdened with the consideration and cultivation of many details. They get their idea,

they elaborate it, they improve and alter it after consultation with their colleagues—for a Government bill must be the bill of a Government and not of one man—and then they turn it over to one particular specialist, the same man in every case. You never hear of him in connection with these mighty measures. There is no particular reason why you should. But he makes them all, every one. All these bills which go on to the statute book and regulate our conduct in various most important matters always afterwards, and those other bills which are hurled away into oblivion as failures, are manufactured, adjusted, polished up, and made presentable for parliamentary purposes by the Government's bill-maker, who is the First Parliamentary Counsel, by name Mr Arthur Theodore Thring. Many weeks before Parliament meets the Government sends for Mr Thring and tells him in great confidence of the schemes that have been hatched, and of the work that lies before him, and then this most valuable official betakes himself to his den and makes the bills. He and the responsible Minister in each case have their heads together many times. The Minister sends along to his skilled workman all such facts and ideas as occur to him while the bill is on the stocks, and all the time that it is so Mr Thring, while endeavouring to fulfil to the utmost the Minister's idea, is engaged in the even more difficult task of seeing that the bill does not cause vexation to any other Minister belonging to a different department of State. He must see that there is nothing in this new bill which runs counter to something in another that he has had in hand some little time for a different statesman patron, and he must word and phrase his clauses so that they give the least offence to the critics who will examine them. It is strange, but true, that the severest and often most implacable of these critics are not the gentlemen who sit on the Opposition benches, but the colleagues of the Minister in private and beforehand. So among the greatest and most necessary of the virtues of this Government bill-maker are those of discrimination and tact. In due course the bill is launched. Let it win or lose, it is the work of a master. If the lobbies are against it Mr Thring sees it not again; but in general it comes back to him much bruised by the ordeal it has passed through, and he polishes it up once again, working in all the little amendments that Parliament has said must be made. And in due course it goes to the King, and is made to be the law. Great feats have been performed in this office of the Parliamentary Counsel. Probably the 'record' belongs to the predecessor of its present chief, who is now Lord Thring and was then Mr Henry Thring. He was given but a single day to make a bill of no less importance than the Reform Bill of 1867, and a most excellent job he made of it in that very short space of time. Disraeli sent for him one Thursday night, told him all about it, and said that the bill must be finished, printed, and laid before the Cabinet at its sitting on the following Saturday. This was what is colloquially termed 'a large order,' but counsel was undaunted. On Friday morning at ten o'clock he set to work composing the measure, and he had two shorthand writers at his elbow, to whom he dictated each new clause as he thought it out. At six o'clock the bill was finished, and it was sent off to the printers immediately, so that the Cabinet had it the next morning. And it was introduced on the Monday following. One is reminded of one of the best of all parliamentary stories about bills and their various fates. Lord Eldon, then Lord Chancellor, filled a bag with bills that had triumphed over their enemies, and took them down to Kew, where King George the Third then was, that His Majesty might give his gracious permission for them to be placed on the statute book. The Lord Chancellor was reading over the names of the bills, when the King interrupted him, saying, 'You are not doing this business in the right way. You ought to leave these bills for me to read, or if you do not, you should do as Thurlow once did. Thurlow read a few of his bills to me, and then he stopped suddenly, and said, "Oh, it's all damned nonsense trying to make you understand them, so I think you had better consent to the whole lot at once."' His Majesty was understood not to be in good health at the time.

* * *

People generally do not make themselves well acquainted with the principles and details of even important Government measures that are not to a large extent of a party character, and there is ample excuse for them. They have not the time to consider causes and circumstances. It is seldom indeed that such a study would be so well rewarded as in the case of the Port of London, for which new legislation is being made which will render it a more compact, smooth-working, and efficient piece of the Empire's machinery than it has ever been. One supposes that hardly one man in a hundred has ever stopped for a moment to think of all the magnificent meaning of this port. For our own part, we should be inclined to regard it now as the first wonder of the earth, for it contains in itself something of nearly all other wonders. This piece of the Thames was water of consequence in the olden times when kings and queens sailed along it in their gaily decked ships of state; but to-day, with the Empire spreading in all parts of the world, the port is exalted accordingly, for it is really the clearing-house of the Empire, even of the world. Everything that is made, or that is grown, or that can be found in the air or the earth in any part of the world is brought here to the Port of London, and here it remains for a short season until its further destination is arranged. So at the same time we have in vast warehouses at the docks some of almost everything. If it is what we would call a common thing, then the quantities of it that are constantly there—added to and subtracted from almost every hour, so that the whole bulk is quickly changed—are to be reckoned in millions. Thus, to

quote a case of a simple commodity, it was found just lately that there were nine million pounds' worth of tobacco down at the Victoria Docks at the same time, and this was not an unusual circumstance. Of even the scarcest things there are some; and an odd story is told that a proud Londoner, boasting that there was everything in the port, offered to wager with a stranger that there would be any one thing he would name, the only condition made being that this thing was generally recognised to the extent that the first man appealed to would have heard of it. The stranger agreed, an elaborate feast was made the stake, and there was no need to appeal to any first man, for a lion was nominated—just a live lion. And so the twain went down to the docks and made inquiries; and soon they came upon a cage of live lions! Not far away there were more lions. It was stated by a stevedore that a ship just away along held more lions. The docks seemed to abound with lions. All the forests of Africa might have been beaten in a search for lions to be carried as imperial spoil to the heart of civilisation. So the stranger felt the poverty of his knowledge and ideas. Here in the port you have always ships of every land, people of every race, colour, and tongue. All of them are living life at its very hardest. If you wander about these docks for a day you must feel that you know far more of the world and empire and life than you did before. It is a great experience, and it is one that teaches humility as not many do. If it is suggested that the people who only know England know nothing of England, then it may be said that those who know this port know all the world, and a few days spent in it might do more in education for some men than a year of foreign travel. London is wonderful, and the port is the most wonderful part of it. The most interesting voyage of short length that can be made is down the lower Thames from the neighbourhood of London Bridge. Here you see before you in a winding panorama something of many nations, and reminders of many times; and there is a picturesque quaintness about the water-side which calls tales of Dickens to the memory. A rough life is still led, and must always be, by the hands of the Thames, and petty crimes are perhaps considered of less account down here than in any other part of Britain; but the river now is greatly law-abiding in comparison with what it was not much more than a hundred years ago, when the port was infested with organised bands of robbers who specialised in different ways, and according to their class were called 'Light Horsemen,' 'Heavy Horsemen,' 'Game Watermen,' 'Night Plunderers,' 'River Pirates,' and so forth. For example, the 'Night Plunderers' consisted of watermen made up of gangs of four or five, who suborned the watchmen guarding lighters and other vessels having cargoes on board, and who carried away in longboats everything that they could lay their hands on. The 'River Pirates' used to strip the ships of their appurtenances at every opportunity. Thus it is recorded that an American vessel lying at East Ham Pier was boarded in the night, while the captain and the crew were asleep, by a gang of pirates, who actually weighed the ship's anchor and hoisted it into their boat, having a new cable attached to it all complete, and with all this they got clear away. The captain saw them rowing off, but was powerless. They told him they had taken his anchor, and they bade him a good-night. Such things were of common occurrence in the old-time Thames which approaches a new epoch.

* * *

A man of much experience and importance in diplomatic affairs was lately discussing in private some various changes of consequence that were being made among the ambassadors. He said that President Roosevelt was very right in what he had done, and was, indeed, only the first to set an example which must soon be more or less general. The days when distinction of birth, great wealth, and a disposition to lead a fully flavoured social life were to be regarded as among the chief qualities of the ambassador of a great Power to a foreign Court are fast departing, so he said. It goes without saying that the ambassador must now, as always, and if possible more than ever, be the possessor of the most superb tact, have all the necessary statesman-like qualities developed in a high degree, and be the most excellent gentleman. It is evident that there are most difficult times ahead, and this is a severe, prosaic age in which the destinies of nations are not so often settled over dinner-tables nor wars brought about in ballrooms. So what the nations want most in ambassadors are the men with the best brains. To illustrate some of the points that he had been making, the speaker told two stories which may not be new to all readers, but which are in any case well remembered. One concerned that dangerous despatch that was cabled by the American Government to its British Embassy for communication to our Government at the time of the Venezuelan trouble. Mr Bayard was the ambassador in London at the time, and the proper course of procedure for him was to take the despatch across to the Foreign Office, read it to Lord Salisbury, and leave a copy of it with him. When Mr Bayard first saw it, after it had been decoded, his pulse throbbed and he felt afraid, for the terms were so threatening that they could hardly be conveyed to the British Government and peace maintained. Sadly he went across to the Foreign Office, saw Lord Salisbury, and sorely against his will began to read the message. He had read but two or three lines when the Marquis called out, 'Stop! Your Excellency need not read any more of the message.' And he did not, and was glad that the task was spared him. It is said that a copy of the message is still preserved in the Foreign Office, and that a mark indicates the place where Mr Bayard stopped reading. The other story is piquant. It is said to explain how it was that through the medium of the newspapers a certain

visit of King Edward to Paris was made known before the Governments wished it to be. At a famous restaurant one evening a young diplomat, who was fond of 'life,' was entertaining a certain beauty who passed under the assumed name of Cherlaine de Montmorency. There was champagne and confidence. At one fine moment the man bent forward to the lady and murmured a toast, '*Tu sais*, Cherlaine, to-night you must drink to the health of Edouard VII., who will shortly be on a visit to Paris.' The toast was honoured gaily, and a gentleman of the Press who had been sitting close by got up hurriedly, but unnoticed, and went to his office with the news.

A PAWN IN THE GAME.

CHAPTER XXIX.—AMONGST THE ARABS.

JACK felt the hot tears running down his cheeks. To escape the wrath of the sea, and to die by a chance shot a moment afterwards—this surely was the last cruelty of fate. It almost broke his heart to see a spirit so brave quenched so suddenly. He was hardly conscious of the rush of feet on every side of him, of the dirty hands that seized him, the dark, wild faces that stared at him with questioning and pitiless eyes.

He struggled up, on fire with anger. His tall figure, his threatening brows, the flame of wrath in his eyes, for a moment cowed them.

'You brutes!' he cried.

The effect of his wrathful eyes and threatening gestures was but momentary. He was a single man, unarmed and crippled, and the Arabs closed on him. He was seized roughly by a dozen dirty brown hands, while the black eyes flashed and the white teeth gleamed in the swarthy faces. He would have fared badly, but the chief thrust himself into the struggling group, and in a high, shrill voice and with furious blows rescued the prisoner. He was, Jack thought, the most villainous-looking figure in the whole band. His lean and wrinkled face was surmounted by a mat of grizzled hair. The gums behind his thin lips were toothless. He was of a great age; but the eyes under his shaggy brow were very alert and burned with cruel fire.

For some reason, however, he wished to preserve from injury the captive who had fallen into his hands; and, having rescued Jack from his angry followers, he ordered him with a brief gesture to follow. The whole band climbed the rugged front of the cliff with the nimbleness of monkeys, Jack following them with difficulty. Grant was left to the sea-birds, with the sea he loved to chant his requiem.

A couple of miles from the coast, in a tiny valley, was the Arab camp, a cluster of low tents, some of skin, some of dark-brown cloth. A dozen women in ragged dress, with a screen of dirty cloth over each face, came out of the tents as the band returned, while a score of half-naked children gathered round Jack with shrill cries and impish curiosity. The sheikh squatted in front of the principal tent, the rest of the Arabs forming a circle about him, and began to interrogate his captive. But as the questions were in Arabic, Jack could only shake his head by way of answer; he spoke in English, and, as that failed, in French.

At the sound of French the listening Arabs grew interested, and a youthful member of the band was thrust to the front, and, to Jack's surprise, addressed him in broken French. Jack explained, with much confidence, that he was English; but if he expected that circumstance to be a recommendation to his captors, he was quickly undeceived. A clamour of angry voices arose when what their prisoner had said was interpreted to them; a dozen dirty brown arms were in the air together; knives were once more flourished; but the sheikh, in a voice shriller than any of his followers, hushed the tumult. Jack's despatches were then examined, but apparently nobody in the camp could read them.

Much excited speech followed, but finally Jack was dismissed from the circle with a brief gesture. He was inexpressibly weary, and flung himself down under the scanty shelter of a little thorn-bush. A woman with a corner of a dirty *haik* drawn over her features presently brought him a dish of barley-meal and milk. She was fat and good-natured, and Jack, with many gesticulations, persuaded her to pour water over the splints of the broken arm, thoroughly soaking the bandages.

His ill fate, Jack guessed, had thrown him into the hands of a band of Arabs who were in league with the French. The French, it is true, had not many such allies. When the expedition landed, Bonaparte announced that he had come to deliver Egypt from the oppression of the Mamelukes, and many Egyptians had flocked to his standard, drawn by the hope of freedom; but that delusion had long since perished. The French, it was found, ruled more sternly than even the Mamelukes, and, as the suppression of the revolt in Cairo showed, could punish more mercilessly. Some scattered Arab septs were still, however, on the side of the French, if for no better reason than that some tribe with which they were at war was on the other side. There was, too, a highly profitable trade carried on with the French camps. They bought horses, cattle, fodder, &c., and the Arab is a born trader.

The Arabs into whose hands Jack had fallen were on their way to the French headquarters. This explained the drove of horses and lean cattle with them. They had decided, Jack guessed, that he was a prize whom the French would value, and

they would carry him to Acre (just then being besieged by the French) in the hope of being paid a good round sum. On the whole, he judged his life was safe. If he were surrendered to the French, indeed, the old ties of comradeship betwixt himself and Bonaparte might prove useful.

As night came on the wind fell, and Jack, almost too tired to sleep, lay on the sand. He thought of Grant, his naked body lying unburied within call of the sea; but the brave and loyal spirit was beyond reach of ill. Then Jack looked up to the sky, the night sky of the East, its profound depths gleaming with the flame of innumerable stars. There was peace in the high, calm heavens—a peace that seemed to rebuke the trouble of his heart. Into those high realms of calm and beauty Grant's brave soul had passed.

Jack recalled the experiences of the wreck: the storm, the black and leaping seas, the long hours of darkness and waiting. At least he was better off, and perhaps safer, lying on the sand in the slumbering Arab camp than on the shaking deck of the ill-fated *Sylph*. Presently the moon rose, a disc of pure silver, and flooded sky and earth with its mysterious light. The white, magic beauty of the night soothed him; its divine hush and calm seemed to creep into the very cells of his brain. His fat friend, with the dirty *haik* over her face, had flung him a ragged blanket; and, drawing this about him, Jack slept.

In the early morning, while the stars still shone faintly in the sky, the camp was broken up and the march begun. For some reason, the Arabs would not wait even for the plunder of the wreck. They had, Jack guessed, some feud with the Arabs of the neighbourhood, and they hurried on their march like men who were crossing the territory of an enemy. Grant had told him they were somewhere in the neighbourhood of El Arish; and Jack hoped the band might make for that place or for Jaffa. Both places were in the occupation of the French, and he knew he would be safer in a French camp than amongst the Arabs. But for some reason the old sheikh at the head of the band swung off to the right, and they travelled all day on a line diverging from the sea.

The march was fast, and though the Arabs camped during the midday hours, they travelled far into the night. On the second day the blue Judean hills were visible to the right; but the Arabs kept to the west of Hebron, carefully avoiding all the villages. The country was dry and treeless. Sometimes it became a mere stretch of sand, and although it was one of the cool months of the year, the heat was scorching.

On the third day the track led them along the foothills of the great range, and Jack looked with keen interest on the crest of hills showing in clear-cut purple against the sky above them. Behind those hills lay Jerusalem; and as he gazed on the steep hill-slopes the words of an old psalm began to sing themselves, like some deep, harmonious chant, in his brain: 'I will lift up mine eyes unto the hills, from whence cometh my help.'

How many generations of dead saints had gazed with eyes of longing and faith on those hills, and followed the slope of the azure summits to the deeper azure of the Eastern sky above them! And in his heart Jack repeated the words of ancient trust, 'My help cometh from the Lord, which made heaven and earth. He will not suffer thy foot to be moved: He that keepeth thee will not slumber.'

As the days went by, and the pain of his broken arm grew less and it was clear the bones were reknitting, Jack's natural courage revived. He studied the Arabs keenly. They reminded him in some odd way of his old comrades in the lanes in Paris. These Arabs were the Rats of Paris grown a little older and a little dirtier, set under a new sky and equipped with a new set of habits, but with most of the impish and irresponsible characteristics of the Rats; their capacity for unnecessary cruelty, their childishness of intellect, linked to some qualities of impish adroitness and cleverness. Jack felt sure that he could establish some influence over them, and perhaps bend them in the long-run to his will, if by any ill-chance he failed to gain French protection.

On the fourth day the curve of the hills thrust their track westward towards the sea, and in the afternoon, from the summit of a low hill, a long stretch of blue water became visible. Jack searched the clear skyline with eager eyes. At one point a leaning triangular patch of silver was visible, the topmast of some ship, perhaps an English cruiser; but it was far off, and melted into the silver of the sky while he stared at it.

Their track still ran westwards till it almost touched the brown sands of the beach, and the salt air of the sea was in their nostrils. Just as the sun was setting, round a jutting headland came a great ship. She was so close to the shore that Jack could see the white line of hammocks along the bulwarks, and the red jacket of a marine showed—a speck of crimson—on the quarterdeck. She was a fine two-decker under easy sail, under topsails and jib alone. A gust of wind blew out from her topmast the British flag. It was plainly one of the squadron off Acre, and poor Jack gazed at her with longing eyes. That stately ship represented the might of the British navy. It had the men and speech of his race on board. For him it meant freedom and comradeship, and it was almost within hailing distance.

An officer—a middy by his dress—jumped into the ratlines and levelled his glass at them. Some sharp eyes had discovered the Arabs. The spectacle of the great ship so near had, meanwhile, arrested the whole band. They were staring wide-eyed at her, and discussing her with eager voices. But the old sheikh gave a shrill word of command and led the way hurriedly round the shoulder of the hill, and the ship passed out of sight.

(To be continued.)

BRITISH MALAYA AS A FIELD FOR INVESTMENT.

By Sir FRANK A. SWETTENHAM, K.C.M.G.

SOME years ago, while discussing the prospects of British enterprise in Malaya, a friend of standing in the City of London said to me, 'We do not want to know what to invest in. We can find that out for ourselves. All we wish to know is that there is proper protection for life and property, that the laws of the country are drawn in a liberal spirit, and that the Government is prepared to give reasonable encouragement to capitalists.' I was able to give him the necessary assurance on all these points, but I am not certain that he was right in disdaining advice in regard to the capabilities of the Malay States.

As to safety, the law of the land, and the attitude of the Government in regard to those ready to invest in Malay enterprises, it is perhaps sufficient to point to what has been done under British advice and control during the last thirty years, to the enormous increase in population, in trade, in revenue, in development, and public works of every description in the Federated Malay States. The facilities of communication, where none existed thirty-two years ago, are sufficient guarantee of the character of the administration. Until quite recently the advancement and prosperity of these countries have been built up upon tin-mining; but so long ago as July 1883 the then Resident of Perak, Sir Hugh Low, wrote in a published report: 'All kinds of india-rubber succeed admirably, and seeds and plants of *Hevea brasiliensis* have been distributed to Java and Singapore, to Ceylon and to India, and supplies will be forwarded on application to any person or institution which will take care of these valuable plants.'

If my City friend, or any one else with capital and enterprise, had then taken Sir Hugh Low's advice, and planted rubber in any of the protected States, he would have cause to congratulate himself; but so far from that having been the case, Sir Hugh Low wrote in February 1884: 'British capitalists have, with the exception of the enterprising merchants from Shanghai, as yet done little or nothing in Perak; a feeble commencement only being yet apparent on the part of two concessionaires from Australia, to whom large grants have been given.'

The cultivation of rubber was not seriously undertaken till about eight years ago, and then only because Liberian coffee had failed to justify the expectation of those who had invested their capital in the cultivation of that product.

It seems almost superfluous at this time of day to say that British Malaya includes the Crown colony known as the Straits Settlements—that is, the islands of Singapore and Penang, a strip of mainland opposite Penang called Province Wellesley, another strip seventy miles south of Penang called the Dindings, and the settlement of Malacca, also on the mainland, one hundred and twenty miles north-west of Singapore. These places belong to the British Crown, and some of them have been in our possession for one hundred and twenty years. Taken altogether, their area is small and most of the land is already occupied. In the southern half of the Malay Peninsula there are five considerable Malay States (covering about thirty-five thousand square miles of territory), four of which—Perak, Selangor, Negri Sembilan, and Pahang—have been administered under British advice and control for some thirty years; and the fifth State, Johore, has treaty arrangements with the British Government. The colony and these five States are here referred to as British Malaya.

As regards the colony, its ports are free, taxation is very light, and labour is abundant and comparatively cheap. Singapore is a market and port of call with an immense through trade and a large local collecting and distributing trade. The life of the place is in the harbour, docks, and river, and all that has to do with the handling of merchandise. The tin-smelting works in Keppel Harbour are the largest in the world, and the success of this, the greatest of local industries, may be gathered from the fact that the shares have for many years stood at a very high premium. This company, the Straits Trading Company, came into being as the result of the development of the Federated Malay States, and its business is to smelt the tin ore exported from these States, and also to a smaller extent to perform the same service for ore from the Netherlands-Indies and from parts of Australia. A certain quantity of cocoa-nuts are grown in Singapore, but the production is not important.

Penang, on a greatly reduced scale, does for the northern end of the Strait of Malacca what Singapore does for the southern; but both on the island and in the Province of Wellesley a considerable quantity of rice and cocoa-nuts are grown, and the latter especially is a paying and a permanent form of agriculture. Sugar has also been a staple product of Province Wellesley for many years.

Malacca is an agricultural settlement where rice, cocoa-nuts, tapioca, and in recent years rubber are grown in considerable quantities.

Just as the Federated Malay States and Johore offer a far larger field of selection, owing to their greater area, wider ranges of temperature and of rainfall, so their great stretches of virgin forest, fine rivers, and hill-ranges present to both planters and miners opportunities not to be found in the British colony. When these States were still under Malay rule almost the only knowledge possessed of them in the colony was that they exported a certain

amount of tin. As has already been stated, the Federated Malay States have been developed from a roadless, uncultivated, and very sparsely inhabited jungle into prosperous countries, with roads, railways, telegraphs, harbours, fine public buildings, considerable towns, and a population of close upon a million people, on the produce of the tin-mines worked and owned by Chinese. In 1877 the duty paid on the export of tin from Perak amounted to one hundred and forty thousand dollars; in 1889, the first year giving returns from all the States, it had risen to one million seven hundred and fifty thousand dollars, and in 1906 to ten million dollars. In smelted tin and ore, approximately twenty-five thousand tons were exported in 1889, forty-five thousand tons in 1906, and for many years the States have been responsible for more than half the world's supply.

Of course the export-duty on tin was not the only source of revenue; but, speaking broadly, it may be said that the mining industry, directly and indirectly, supplied the funds for the development of the States. It was Chinese capital, enterprise, and labour which opened and worked the mines, and the same Chinese paid the excise and most of the other duties. The surplus revenues raised from these sources built the railways, which in 1906 added to the revenue four million five hundred thousand dollars, of which one million five hundred thousand was profit.

Tin-mining in the Malay States is almost wholly confined to alluvial workings, and this is one of the reasons why the industry has always been so largely in the hands of Chinese. This class of mining can be conducted on a small or a large scale, it can be done by primitive and economical methods, with the use of little or no machinery, and a return is usually secured within six months. A good many years ago, however, a system of hydraulic mining was introduced to deal with ground which could best and most cheaply be worked by this means. Water was conveyed by pipes from some supply with a good fall, and a pulsometer playing on the tin-bearing land did the work of many miners, cutting away the overburden and washing out the ore. The capital required depends, of course, on the distance the water has to be piped, but the enterprise is not one involving great risk, and it must be profitable, for there are a number of companies, founded mainly with British capital and working under British management, whose shares are at a considerable premium. In alluvial mining it is possible, by careful boring, so to test the ground that the quantity of ore it will yield can be ascertained with fair certainty, and the risks of mining are therefore reduced, barring accidents, to a minimum. The real risk is in the price at which it will be possible to sell the metal, for the tin-market has a way of fluctuating which is difficult to explain, though it is often trying to the producers. Malaya has, however, such great advantages in a plentiful supply of water and cheap labour that, hitherto at any rate, it has been possible to continue working there when the price of tin has been at its lowest. I remember some years ago asking the leading Chinese mine-owner, a very wealthy man, to invest some of his capital in planting rice, rubber, and cocoa-nuts; but he replied, 'I know nothing that pays like tin-mining, and that is good enough for me.' As he had been a tin-miner all his life, and was then an old man, I suppose he knew. There is at least one British company engaged in mining for tin underground, in the rock, and prospects seem to be encouraging; but these remarks refer to alluvial mining, and in regard to that industry in the Federated Malay States there are certain conditions favourable to investors. There is no doubt about the presence of the ore; it is found over large areas, many of the best fields are well known, and it is certain that many still remain to be discovered. It is a comparatively easy and inexpensive matter to ascertain the value of alluvial deposits by boring and by experimental working. Leases to work the land can be obtained from the Government on very easy terms. There is abundance of water, and every water-supply is reserved and controlled by the Government for the general benefit of all miners. Communications by road and rail are good, and they are being constantly extended to newly discovered tin-fields. Labour is plentiful, Chinese for the most part, and it is comparatively cheap. The only import-duties are on opium and spirits. The largest tin-smelting works in the world are in Singapore, to which there is cheap communication by rail and steamers from all the ports of the Malay States, and Singapore offers the best market in the world for the sale of tin.

I have tried to explain that there is a difference between tin-mining in Malaya and underground mining in other parts of the world; but the investor, small blame to him, may look askance at all forms of mining, and to him the Straits Settlements and Malay States may offer a more attractive field for investment in agricultural produce, especially rubber. The Malay grows rice, and usually does fairly well with it; though, unless artificially irrigated, the crop must depend on rain, which, if fairly constant in annual quantity, is often uncertain in the period of its fall. Rice-growing has not hitherto appealed to Europeans. The cultivation of cocoa-nuts and sugar by Europeans, Chinese, and Malays is common, and has been carried on for years. There is no doubt that the cultivation of cocoa-nuts, either for sale of the nuts or in the form of copra, is a safe and profitable business. The drawback is that the trees take about five years before they bear nuts, and they are not at full maturity for another five years or more, though they will continue to bear till they reach a great age, and maintenance costs but little. The cultivation of sugar requires a much larger capital for planting, draining, and especially for machinery;

but it gives a quick return, labour is cheap, and there is a good market in the Straits for all the common kinds of cane sugar. The unforeseen element is the variation in price; but where the conditions are favourable as to soil, cheap communications, a fairly constant rainfall, and adequate labour, sugar may become a most useful catch-crop for the nursing of a large estate of cocoa-nuts or rubber, or both. There are successful sugar-estates in Province Wellesley and Perak, and there are thousands of acres of land on the western shores of the Peninsula which would lend themselves to the same cultivation.

The interest aroused of late years in the cultivation of rubber in the Straits Settlements, and still more in Ceylon and the Federated Malay States, has diverted the attention of European planters to that product to the practical neglect, in British Malaya, of all others. Those who had for years tried Arabian, then Liberian, coffee, and in a few instances tea, with results which fell far short of their expectations—not because of any failure in the plants, but in the case of coffee because of the great fall in market prices—turned their attention first to the experimental and then to the extended cultivation of rubber. Drawing their own conclusions from the appearance of the trees planted so long ago in the Government Gardens in Perak, Singapore, and Penang, and most ably assisted and encouraged by Mr Ridley and the other officers in charge of these experimental plantations, the planters of Selangor secured the seed of the mature trees and began the systematic cultivation of Para rubber, *Hevea brasiliensis*, the tree which appeared to be best suited to the soil and climatic conditions of the Malay Peninsula. Then followed a long period of waiting, for it was not then deemed wise to commence tapping until the trees were six or seven years old, though it has since been done on trees four and a half and five years of age when their growth seemed to justify the operation. During this period, however, experiments were made on the old parent-trees with results so satisfactory that the planting of Para rubber was taken up by practically every European planter in the Malay States, and was pushed on to the extreme limit of his resources. With the maturity of even a small proportion of the trees came the assurance of a yield of latex and of dry rubber higher than the most sanguine had dared to hope; and as this plantation rubber was favourably received in the market and fetched a price which in May 1905 reached six shillings and tenpence a pound, and it was confidently asserted that it could be produced at one shilling per pound, or even less, those who knew the facts realised the favourable prospects of rubber cultivation, and found no difficulty in securing a large amount of capital for the purchase and extension of existing plantations and the opening of new ones. The same thing occurred in Ceylon; and at this time it was said by those qualified to judge that the price of rubber was less likely to decline than to rise, at any rate for five or six years, during which time the produce of plantation rubber could have very little effect on the world's consumption, which was estimated at about sixty thousand tons annually. It is certainly unfortunate that the experts should prove to have been mistaken, for the average price of plantation rubber is now about three shillings and fourpence halfpenny per pound, against an average of five shillings and sixpence halfpenny only twelve months ago. The three hundred and forty-eight and a half tons of Malay and Ceylon rubber sold in the year 1906 fetched an average price of five shillings and sixpence farthing per pound, while the eight hundred and fourteen tons sold last year realised an average of four shillings and ninepence and five-eighths per pound.

Last August the shares of the oldest and best-known Malay rubber-companies were at a very high premium; and though it was impossible to foresee the coming financial trouble in America, and the natural effect that a great reduction in the purchase of rubber by the country which had hitherto been the largest buyer would have on the rubber-market, it is interesting to examine the prospects of the industry in the light of greatly reduced prices.

The present depression, if it may be so called, is not altogether to be regretted, and some of the most interested, both planters and investors, regard the fall in price as a blessing in disguise, and they rejoice that this 'set-back' has come thus early in the life of the industry. The oft-renewed and industriously circulated reports of the discovery of the means of producing synthetic rubber at a trifling cost have no doubt frightened timid investors in the cultivation of natural rubber. I do not propose to discuss this question, because similar reports have been made before without any great result, and it is impossible to deal with mysterious processes which cannot be submitted to the ordinary tests. Hitherto it would appear that the value of every rubber substitute or so-called synthetic rubber depended upon the quantity of natural rubber which it contained; and such an authority as the Director of the Imperial Institute, while regarding the production of synthetic rubber as distinctly probable, puts the actual realisation of that probability at a considerable distance in time. When the end has been achieved it will remain to be seen whether the artificial rubber possesses all the qualities of the natural product, and whether it can be put upon the market at a price to compete successfully with plantation rubber. Even when the means of producing synthetic rubber have been discovered, it remains to be proved whether the artificial product will *possess and retain for any length of time* those singular properties which, in natural rubber, are the result of years of growth, and increase with the age of the tree. Such a practical test could hardly be made in less than two years.

Leaving that question to those qualified to deal with it, we may inquire with more profit whether rubber-growing in British Malaya is a sound invest-

ment. I think the reply is that such an investment offers very great prospects of permanent success, provided that too high a price is not paid for the land, that in the case of a company the undertaking is not over-capitalised, that ample funds are available for bringing the trees to the producing stage, and, above all things, that there is intelligent, energetic, and economical management in the East. These are some of the points which will now receive greater attention than would have been the case if the price of rubber had not fallen, as it has done, in the last two years and especially in the last six months.

Hevea brasiliensis, the species which seems best adapted to the soil and climate of Malaya, is a hardy forest-tree, not easily destroyed or injured by known pests, it has been proved to thrive exceedingly in Malay soil, it has a long life, and it yields an ever-increasing quantity of rubber, while the expenses of upkeep should with good management decrease. There are thousands of acres of suitable land to be had from the Government of the Malay States at a very moderate price. It is true the price, especially the quit-rent, has been raised in view of the recent great demand, and opinions may differ as to the wisdom of that policy; but there can be no difference of opinion in regard to the unwisdom of purchasing forest-land at three, four, or five pounds an acre from a private individual who has but lately acquired it for perhaps one-tenth of the sum. Of course there are lands which are so favourably situated as regards health, communications, soil, water, drainage, access to supplies, and so on that they have a special value. Again, where the rubber has already been planted over a considerable area, has been properly tended, and is already bearing or well grown, a purchaser will naturally have to pay a high price both for the rubber and the adjoining forest. Most of the estates with mature rubber-trees have already passed into the hands of companies registered in England or Scotland, and a number of them have already returned large dividends to their shareholders. Had the price of plantation rubber continued at six or even five shillings a pound, it is probable that a great deal of speculation would have resulted, clearing and extension on a huge scale would have taken place, and there would have been an inevitable reaction and some discredit. It is to be feared that estimates of the value of partially planted estates in Malaya and its neighbourhood are sometimes framed on an extravagant scale, while prospectuses have been issued where the estimated selling price of the rubber was too high and the estimated cost of upkeep and extension too low. These matters do not affect the question whether rubber is a sound investment, for it must be assumed that the investor will take some trouble to inquire into the condition and prospects of the undertaking in which he elects to take a share.

Labour is, of course, a vital question, and a year ago it gave cause for anxiety because of the sudden demand for a largely increased force to carry out the extensions which were pressed on in every direction, and especially in certain favoured districts. The labour mainly employed comes from Southern India; and partly, no doubt, on account of the great quantity of forest-clearing for rubber-planting, and carelessness in dealing with stagnant water, malaria appeared a year ago, and attacked with unusual severity the labourers and the European planters. Happily the conditions have improved, and a new system of labour-recruiting has been instituted from which satisfactory results are anticipated. As a matter of practice, it is found that on most of the estates the estimated cost of extension and of upkeep, especially weeding, has been exceeded, while the expense of tapping the trees and curing the rubber varies enormously, and in most cases is far higher than it should be. The price of rubber has fallen greatly, and it may, at any rate for a time, fall farther still. That may be fortunate if it tends to limit indiscriminate speculation and the almost frenzied extension of rubber-planting without perhaps sufficient capital to nurse the trees to the bearing stage; but it certainly means that those in charge of the estates must exercise a much more rigorous economy in every particular, must devote their whole time and ability to the service of their employers, and must give a new and a very careful attention to the preparation of rubber for the market, so that it will preserve a uniform excellence and the brand of each company will in time be recognised as a guarantee of quality. It is difficult for a directorate in Europe to ensure the exercise of proper management in the Far East, but it is not impossible; and there is no reason to doubt that the planters of Malaya will realise the situation and make the most of the great opportunity which lies ready to their hands. The planters of Ceylon have earned a well-deserved reputation for courage, persistence, and resource in adverse circumstances. There are many of them in Malaya; and they and their colleagues, who have only local experience, must recognise the conditions, which fortunately are far from adverse, but still need firm and intelligent treatment and the undivided attention of each manager to his own charge.

The fact that a considerable proportion of the 1907 produce can only realise a reduced price must affect future dividends, but thoughtful shareholders will remember that these and previous dividends have been earned on the produce of a fraction of the planted area of their property, and even the tapable trees are all still young and have not yet reached anything like the limit of their yielding capacity. There is no doubt that even with rubber at two shillings and sixpence per pound the cultivation of Para will pay well; for it can be put on the market at one shilling and sixpence per pound, and it is questionable whether the forest rubber of South America can be brought to market at that price. With proper economy, good management, and no unforeseen calamity, thoughtful planters believe

that it may be possible to reduce the cost of production to one shilling per pound; while those who give special attention to uniformity and excellence in the preparation of their rubber will always be rewarded by securing the best prices.

So far as it is possible to judge the future by past results, British Malaya offers a good opportunity for sound investment in alluvial tin-mining and in the cultivation of rubber and cocoa-nuts as permanent industries. Sugar and tapioca have both been used as catch-crops with satisfactory results; and, in Johore especially, Chinese planters have made fortunes out of the combined cultivation of gambir and pepper, using gambir as the catch-crop. So much depends upon good management that success cannot be expected unless that condition is secured; with the right men in charge of mine and plantation, a property combining these two industries might prove a very successful undertaking, for the tin-mine should be able to return good dividends while the rubber was being planted and brought to the producing stage.

THE TEACHER OF AUCHNACOUR.

III.

IT was a trying winter for John Stanham, the more trying because he made so little headway with the particular mathematical work to which he had consecrated himself. His colleagues at the university couldn't understand him. Since the long vacation he had been a different man in several ways. A certain consideration for others appeared in him which seemed at first as incompatible with his character as the writing of poetry. Also, his previously smooth brow gained a couple of wrinkles which, he confessed it frankly, had nothing to do with mathematics.

He brought back from the Highlands a habit of taking long walks in all weathers, and it was this which eventually made the winter act upon him severely. He caught a cold, and then another and another. They were, of course, all the same cold, challenging him afresh when he reckoned, or did not trouble to reckon, that he had got rid of it.

But in one respect the winter was not trying to him. At intervals he wrote to Auchnacour, and at intervals Kate Maclean replied. The calf Fergus was a splendid pretext for the correspondence, if he needed a pretext. The fact is he at times realised that it was quite essential to have a pretext.

The winter in Auchnacour was unusually coarse. Partly in fun and partly because it was true, Kate Maclean wrote in one letter that it would be wise to send Fergus to Inverness and sell it; for it was a *bull*-calf after all, and it showed, as the Auchnacour teacher said, what unpractical persons they both were to have discussed its milk of the future. There was very little hay for it, and no turnips. Snow was thick everywhere.

This question of Fergus's food was an enduring topic for John Stanham to write about up to the middle of March. He sent postal-orders for its board. Kate Maclean returned the first two; but they had the journey for nothing, and subsequently she kept them, saying they would go towards the expense of his board and lodgings if he really did revisit Auchnacour. He said she was to indulge the calf with all the luxuries that were good for its time of life. No one could be more capable of fattening a calf, he said further, seeing how successfully she had fattened him.

January brought him some news that interested him very much. He was in a London lodging-house near the British Museum for the Christmas vacation, this being about his nearest available approach to a home of his own when away from the university. He was extraordinarily short of relations, and those he had he didn't care much for.

The news was of course from Auchnacour. Fiona Maclean was going to marry a son of Lord Ambleside's local factor. Her sister hoped it was all for the best. From the worldly point of view it was a very fine match, but it was as great a surprise to her as she thought it would be to John Stanham. James Cameron, the said suitor, had fallen in love with Fiona in a single day, and he was in the most desperate haste to make her his wife.

'I shall be alone with Fergus, the poultry, and my own dear school-bairns as soon as Lent is over,' wrote Kate Maclean. She hinted also at a serious consequence of her bereavement. She might leave Auchnacour for a town; and, in any case, there was now the fear that she could not hope to receive John if the improbable happened and he sought to return to Auchnacour.

The higher mathematics went all to pieces after this intelligence. John scoffed vigorously at the triviality of the brown-eyed Fiona's charms and character. He pitied the factor's son, and now and then anathematised both him and his prospective bride.

His succeeding three letters to Kate Maclean were curiously impetuous in tone. Couldn't she persuade Fiona not to be in such a hurry to wed? And if she couldn't, she was to make up her mind to stay at Auchnacour at any rate until August. Perhaps he would even run up at Easter—to see the calf.

It was shortly after the last of these three letters that his cold got quite the upper hand of him. It developed into pneumonia, and it was in a nursing-home that he fought his battle with death. A hard

fight it was, with much delirium; and for nearly a month the world was of no importance to him. Brain-trouble of an unusual kind complicated the pneumonia, due of course to his intense affection for the higher mathematics.

Indeed, April was well advanced before he opened his eyes sanely to his environment and — Kate Maclean! This was the extraordinary thing.

'Hallo!' he whispered the first time his eyes looked consciously into hers; 'so I'm back, am I?'

She put her finger to her lip with exquisite tenderness in her dark eyes. 'You are not well enough to talk,' she said. 'But you are going on beautifully.'

He could only stare in answer to that, and away she drifted.

Then in came the doctor and a nurse-person, and he frowned wearily at them both. 'I don't follow you,' he said when the doctor had rejoiced and rubbed his hands. 'What brings you all in the Highlands?'

Smiling as if he were still very gratified, and pardonably amused besides, the doctor signalled to the nurse to go; and then, sitting by the bedside, he expounded the situation to his patient.

'I don't want you to nourish an hallucination, Mr Stanham,' he said. 'You have had a grave illness, but the corner is now turned. You talked so violently about a—a certain young lady that really I didn't see any course open to me except to communicate with her. Very fortunately she was able to come, and she is here, as you see. She has done great things for you. Circumstances made it quite convenient for her to come; and, candidly, I think you owe your life to her as much as to Providence, myself, and your rather better than average constitution.'

'Good heavens!' gasped John Stanham when he grasped this.

'A most interesting young lady, Miss Maclean!' commented the doctor blandly, feeling his chin as if he were not altogether satisfied with his shave that morning. 'Your—er—attachment was, if I may say so, a great astonishment to many of your friends here; but I venture to congratulate you, Mr Stanham.'

'You mean to say,' said John Stanham, with sudden brightening of his eyes, 'that my foolish brain has been exposing its secrets in this fashion? And—she knows?'

'Why, yes, to be sure. A certain young gentleman named Fergus has also been much on your tongue. However, nothing remains now but to get you convalescent. I'm delighted with your progress.'

With his eyes brighter still, John Stanham put a thin hand on the doctor's knee.

'I say,' he whispered, 'I wish you'd just bring Miss Maclean, there's a good fellow. I want to say something to her while the iron's hot—while I'm still sensible, that is.'

The doctor consented on condition that he limited his further conversation to a five minutes' effort.

'All right,' said John Stanham.

He lay with his eyes shut until she came, and, thus lying, chuckled two or three times.

'Ah!' he sighed when she entered looking very business-like and contented. 'Sit down, there's a dear girl. And, first of all, how's the calf?'

'Och!' said she, 'don't bother your poor head about the calf. It is very well, and so fat.'

'That's good. And now, Fiona is married, I suppose?'

'Yes, Fiona is married, and I do trust will be very happy.'

'So do I. And last, yourself? How in the name of common-sense could you quit your work to—to come down here?'

'Och!' said she, with that matchless smile of hers, 'that is nothing at all. I am no longer the Auchnacour teacher. I said I should not stay there when Fiona went. I am going to be a very fine cook in a large hotel when you don't want me any longer. And that will be quite soon now. The salary is absurd—more than a hundred pounds a year. But—if you knew what a pleasure it has been to me to be on the side of the angels in helping you in your trouble!'

'H'm!' said John Stanham. 'That's the Kate Maclean I knew last year, all over. But you think I sha'n't want you when I'm well? You think that it's been just the delirium of a jackass—my brainless chatter about you. Nothing of the kind. Let me whisper something in your ear, Kate—quite close—then I'll go to sleep again. I feel I want to, afterwards.'

'You wish it?' she asked, looking anxious, yet soberly proud.

'I wish to be obeyed.'

'Och, very well, then,' she said, bending over him. And then he kissed her.

'That's all, Kate,' he said. 'It's to show you I want you always. Run away now, and bear that in mind.'

The ex-teacher of Auchnacour stood still for several seconds looking down at John Stanham wistfully.

'If I didn't think you might do some such foolish thing!' she said. 'But you will be wiser when you are well.'

'Will I?' said he. 'Somehow, I think you love me.'

'That has nothing to do with it.'

'Has it not? You're about the only person on this earth who loves me, and I'm to let you trot off as soon as I'm fit enough to realise how impossible life is without some one to love and be loved by? Well, I won't. Kiss *me*, Kate. And consider it settled. I'm much too spent for argument.'

She looked down at him again for several seconds, and then slowly bent and kissed him.

'May the Holy Mother make me worthy of it!' she whispered prayerfully.

Then she stole from the room, and presently John Stanham was asleep with a smile on his lips.

THE END.

THE MONTH: SCIENCE AND ARTS.

A TURN-DOWN ELECTRIC LAMP.

ONE of the greatest objections to the incandescent electric lamp, notwithstanding its many advantages, is the fact that when in operation it must be used to its full illuminating capacity, and that the lighting intensity cannot be adapted to requirements such as is possible with gas. By means of an ingenious invention, however, it is now possible to secure with the electric light all the advantages characteristic of the gas-burner, and if desired you can have either a faint glimmer or a strong, powerful light. The lamps resemble in appearance the ordinary bulb-light, and fit into the conventional bayonet-socket, so that no additional fittings or modifications are necessary. The lamp has two filaments, a large one giving the brighter light, and a smaller loop giving only two and a half candle-power. The end of the lamp slipping into the holder has three contacts, upon two of which the pieces within the holder come into connection, establishing the circuit. When it is desired to change, say, from a sixteen candle-power light to the glow, it is only necessary to give the bulb a slight turn in its socket, which has the effect of bringing the contacts of the smaller filament together, so that the brighter light is extinguished in favour of the duller one. To reverse the effect, the lamp is simply turned in the opposite direction. The change from one filament to the other is simply and safely accomplished. There are no switches, and as the current is not broken in changing from one filament to the other, no sparking is set up. But another important feature is that, if so desired, a still brighter light can be secured by giving the lamp half a turn, thereby combining the two filaments at one and the same time. Three different intensities are in this manner obtainable—namely, two and a half, sixteen, and eighteen and a half candle-power respectively. The lamp, which marks the greatest improvement in electric lighting of recent years, should result in a greater impetus being given to the utilisation of this illuminant, since now all the advantages of gas-lighting are obtained. For the sickroom, the nursery, bedroom, and other purposes, where, although a continual light is required, the ordinary electric lamp is too powerful and expensive, it is an ideal acquisition. The current consumed is only in proportion to the light given—that is to say, when the two and a half candle-power light is being emitted the cost is one-sixth of the sixteen candle-power light. The fact that the principle is being widely adopted in hospitals and other institutions where economy is a prime consideration is sufficient evidence of the efficiency of the invention. Any combination up to thirty-two candle-power can be secured.

NOVEL TOBACCO-SPRAYING PUMP.

In the manufacture of tobacco certain difficulties are encountered in the 'liquoring' process, the percentage of moisture allowed being, as is well known, regulated by law. It is essential, therefore, that the spraying should be carried out carefully and skilfully in order to secure the desired proportion of water. This task is now appreciably facilitated by a new pump that has been specially designed for such application. It comprises a portable tank fitted with a gauge plainly marked in pounds, so that the quantity of water used can be instantly ascertained. Upon this cistern is mounted a double-acting pump with lever action discharging the water through a special double form of nozzle in a very fine spray. By means of this apparatus not only can liquoring be carried out more expeditiously than is possible by the usual methods, but the water is distributed more evenly over the leaf, while the exact quantity used is indicated. The apparatus should be possible of wide application, especially in other industries where a vapour-like spray is required in precise proportions.

NEW ANTI-FOULING AND ANTI-CORROSIVE PAINT.

One of the greatest fields of chemical research activity in its relation to our complex industrial life is in connection with paints. Many inventions have been perfected for the purpose of providing a coating to wood and metal which is durable, impervious, and preserving. One of the latest of these, and one which should meet with a ready demand, has been devised by Captain William Taylor, and is the outcome of several years' experiments and investigation during prolonged association with the mercantile marine, where the needs for such an article are probably greater than in any other ramification of industry. It is an anti-fouling composition, and is especially applicable to subaqueous work such as the bottoms of ships, buoys, dock-gates, gas-holders, and other wooden and metallic structures which are subject to immersion in water. Experiments have shown that this composition is resistant to the propagation of barnacles, seaweed, and other marine growths which invariably infest the submerged portions of the hulls of vessels and so forth, while at the same time it opposes the destructive inroads of worms which wreak such widespread havoc upon wood when sunk in water. Moreover, it adheres tightly to the surface to which it is applied, dries rapidly, gives a smooth, clean surface, while a single application has a life of about two years. The anti-corrosive paint is especially applicable to general building-work, such as bricks, masonry, wood, corrugated-iron, zinc, or other metal. It likewise dries very quickly; in fact, the second coat can be applied ten minutes after the first has been completed. This paint gives a hard, china-like

surface which does not chip or blister off. Substances upon which it is used do not require preliminary treatment with any other solutions, and neither heat, rain, smoke, chemical fumes, nor other destructive agents affect its durability. It is an excellent preservative, and is equally applicable to the treatment of the ends of wooden or iron posts driven into the earth, or such superstructures as bridges. It can also be applied to tarred structures with equal success. Used on brickwork, it acts as an excellent protection against rain penetration and prevents the formation of mould or the growth of mossy vegetation, so that buildings so dressed are more weather-proof and drier than those left in the raw condition, or to which ordinary paint is given.

AN AUTOMATIC VIRTUOSO.

The piano-player, owing to its having been brought to a high standard of perfection, has developed into an almost indispensable equipment to the drawing-room. Owing to its success, attempts have been made to apply in a similar manner the mechanical operation of the violin. This, after many years' patient experiment, has been accomplished, and a remarkable musical instrument, constituting a marvel of mechanical ingenuity, has been evolved. There is the orthodox violin with the usual strings; but instead of the bow and fingers there is a series of revolving discs for the former, and an elaborate array of stops which, acting as fingers, depress the string at the desired points to give the requisite musical tone, operated by electricity, the necessary energy being furnished by a small motor. All the peculiar effects incidental to the instrument are perfectly produced, including those which tax the skilled player to the utmost, and in perfect purity and tone. Thirds, fourths, octaves, and tenths are produced as easily as single notes, and every phase of expression is faithfully rendered. The most intricate works of our leading exponents of violin-playing and composers are given with ease and unerring accuracy, while many accomplishments beyond the possibilities of the virtuoso are secured, such as the playing of four chords simultaneously, giving the vraisemblance of a quartette. A fashionable *salon* is to be established in the West End of London where lovers of this instrument will be able to repair and enjoy the choice compositions of Wienawski, Paderewski, Paganini, played by a master-hand whose dramatic and delicate touch, combined with fidelity, cannot be excelled by the most finished human exponents of the violin.

A TIME-STAMP FOR DOCUMENTS.

The high pressure at which present-day commerce is maintained, where even minutes are often vital, has called into requisition an automatic stamp whereby the date and time a document is received, negotiated, or despatched is infallibly indicated. The instrument comprises a small clock, the operation of the mechanism of which prints upon the letter, invoice, or what not the firm's name, department, and such definitions as 'Sold,' 'Returned,' 'Posted,' 'Filed,' 'Called,' &c., together with the day of the month, hour, and minute. It can be applied to any requirement of office routine, and not only constitutes an excellent check upon the working of a department, but offers irrefutable evidence in case of a dispute arising. To brokers and others, where minutes count whether in the handling of a letter, telegram, contract-note, or message, it is of invaluable assistance. The notification is printed in plain characters, the time-wheel working automatically from metal type, so that the liability of the indication being blurred or made indistinct is very remote, and no confusion can result or misinterpretation arise.

A HANDY DEVICE FOR CHILDREN'S PHOTOGRAPHERS.

Every photographer who makes a speciality of portraying children fully realises the tediousness and difficulty of catching his diminutive and restless sitter in 'the happy moment.' Numerous artifices have to be resorted to in order to secure the desired expression. An amusing and inexpensive novelty for such work has recently been placed on the market. It consists of a small toy-house similar in design to a dog-kennel, with a large opening on the upper part of the front face from which protrude sticks and other evidences of a nest. At one side is a small lever, depression of which causes a sprightly bird to appear at the opening, announcing its appearance with a loud 'cuckoo.' It is an application of the well-known cuckoo clock, but its novelty is such that it cannot fail to arrest the attention of the youngster at the critical moment. It should certainly constitute a distinct acquisition to the studio, and being of substantial construction cannot easily be damaged.

AN INGENIOUS TRANSPLANTER.

The methods generally in vogue for transferring flowers and plants from one position to another can only be described as hap-hazard and hit-or-miss practices. Very often not only is the growth of a plant, especially if it be of a delicate nature, seriously set back, but its existence is imperilled. For this reason the new transplanter that has been devised should appeal to all workers in the garden, whether professional or amateur. It not only expedites and facilitates the work, but enables it to be carried out with less disturbance of the roots, and allows the plant to be moved when in bud or full flower with complete safety. The device consists of two cylindrical galvanised-iron tubes, one sliding within the other. The internal is known as the 'discharger,' and the external as the 'transplanter.' When it is desired to remove a plant from one point to another the hole in its new bed is first prepared by pressing the appliance into the ground to a depth of about four inches. It is then rotated and withdrawn, bringing a core of earth in the discharger within. The transplanter is then placed over the plant to be moved, the leaves being

guided into the inner tube, pressed into the soil to a depth of about four inches, given a turn, and withdrawn, bringing the plant, its roots well covered with soil, with it. The transplanter, together with the plant, is then lowered into the hole previously made, and the plant therein deposited by a slight movement of the discharger. Owing to the two holes thus bored being of exactly the same diameter, no filling in around the plant is required, while the core of earth drawn from the first hole is simply deposited in that made at the spot from which the plant was removed. The whole operation only occupies a few seconds, and as the hands are never brought into contact with the earth work can be carried out with cleanliness. The devise is made in sizes varying from one to five inches in diameter, and is inexpensive. The smallest size is especially useful for weeding lawns.

THE RELATION OF ART TO INDUSTRY.

The argument has long been raised that our foreign competitors are far ahead of us in the recognition of the relation of art to commerce and general education, and that in such application they have been enabled to acquire a pronounced advantage over this country. Continental manufacturers realise only too well the fact that drawing is an education medium side by side with writing; that the factory and workshop is dependent to a very great extent upon the drawing-school. The delegates of the British Chambers of Commerce, upon their visit to Austria and Hungary, were impressed with the importance attached to the subject by the native industries as represented by the excellently equipped schools and colleges liberally endowed with scholarships and full of students. For the purpose of fostering this movement the Friendly Association of Teachers of Drawing in France initiated an International Drawing Congress, the first of which was held in Paris during the exhibition of 1900. So successful was the meeting that four years later another was held in Bern. Four hundred members of the French association attended this congress, their expenses being partly defrayed by the State, and the delegates were enabled to inspect a specially organised exhibition of teaching-work, from no fewer than twenty-two countries, illustrating various ideals and methods. The lethargy of our Government and manufacturers in this matter could not fail to impress the British representatives, and they are now making a determined effort to educate this country into the importance and influence of the cult upon professional life. At the forthcoming congress some twenty-five countries will be represented; but whereas the delegates from these will have their expenses defrayed by their respective Governments to a very appreciable extent, those from this country will be entirely dependent upon voluntary support. Of the five thousand pounds required for the object less than two thousand pounds have been received or promised, and a special appeal is being made from the offices of the British committee of the congress, 151 Cannon Street, London, E.C. Seeing the widespread importance of the movement upon our national prosperity, surely our manufacturers will feel it incumbent upon themselves to step in where the State has failed to act, and evince appreciation of the effort which is being initiated in their interests in a substantial manner. It is to be feared that it is somewhat difficult to arouse the necessary activity in such an enterprise, and this apathy only affords another example of the foreigner profiting by our mistakes.

ADULTERATION OF VINEGAR.

Recently a well-known medical paper, in discussing the extent to which food-faking and preserving are practised, ventured the opinion that vinegar was the only article on the table which was immune from such malpractices. Unfortunately it would seem that such a statement was over-sanguine, according to the recently published report of the Medical Department of the Board of Trade. Therein the investigator urges the more satisfactory and accurate descriptions of vinegars in the interests of the community. Vinegar which has been prepared from acetic acid and coloured and flavoured to imitate the genuine article should, he maintains, have some indication of its origin associated with its name, such as has recently been required in connection with butter substitutes, and should not be styled merely 'vinegar' or 'malt vinegar,' which are obviously misnomers. The same authority also deprecates the use of sulphuric acid for the simple reason that as it is not required as a preserving medium its presence cannot be interpreted in any sense other than adulteration. He also adds the following significant warning, which should be taken to heart by all purchasers of the article: 'Vinegar is liable to take up metallic impurities, including copper, from the plant used in its preparation, and contamination by arsenic may occur under certain conditions. Any indication of formation of Prussian blue in a vinegar or pickle which has been clarified by the use of ferro-cyanide of potassium must be regarded with suspicion.' In view of such circumstances it would appear at least advisable on the part of our authorities to insist upon the abolition of these practices, since the consumption of any such adulterated article must be seriously prejudicial to health.

PETROLEUM RESOURCES OF ROUMANIA.

From time to time scares of an impending oil-famine are raised in English commercial circles, especially in connection with the motor industry. True, petroleum and its products appear to be as sensitive in the market as the most speculative stocks and shares; but such fluctuations are in reality the result of the operations of the Standard Oil Trust of America, which has the greater proportion of the oil-fields of the world under its control. Strenuous efforts are, however, now being made to

develop the oil-resources of Roumania, which in the near future promises to become a more serious rival to the octopus of the New World in the supply of this commodity than heretofore. It is computed that the oil-fields of Roumania, which measure three hundred and fifty miles in length by twelve miles in width, aggregate some four thousand million tons. Ten million pounds of capital is sunk in the exploitation of these fields; and the Trust, realising the formidable competition that can be enforced from this quarter of Europe, has made indefatigable efforts to grasp it in its capacious maw. So far every attempt has been adroitly frustrated, mainly through the energy of the present Roumanian Prime Minister. For the Trust to obtain any power in the industry, control of the railways such as exists in America would be necessary; but these tactics are impossible in Roumania for the simple cogent fact that they belong to the State. Even the transportation of the oil from the fields to convenient points on the coast-line through pipes, as is the case in the United States, cannot be resorted to, because the Government has stated that any such lines, if laid, would become national property. Any monopoly, therefore, that endeavoured to bring these oil-fields under its dictation would be very quickly paralysed. Freedom in action is the policy of Roumania in regard to the oil-trade; and, despite its situation among the restless Balkans, confidence in the country is rapidly becoming established, with the result that capital is flowing freely thereinto. Last year over one and one-eighth million tons of petroleum, valued at over six hundred and seventy thousand pounds, were drawn from the earth.

HANDLING BROAD-GAUGE ROLLING STOCK ON NARROW-GAUGE RAILWAYS.

In this country the 'battle of the gauges' was fought to its logical conclusion some years ago, and now a uniform gauge for railways is in use throughout the country. The only exceptions are occasional private yards and sidings connecting manufactories with the main lines, or one or two light railways. In other countries, such as India, however, standardisation does not exist, and owing to the various gauges in vogue a considerable amount of confusion and breaking bulk in the transportation of goods results, with consequent delay and expense. Yet the problem is capable of solution, as a well-known engineer has proved. A narrow-gauge railway in the Midlands experienced considerable difficulty at the junction with the main line with trucks of goods destined for some point on its system. In order to overcome the difficulty, the consulting engineer designed a special type of transportation-car upon which the standard-gauge rolling stock can be conveyed over the narrow road. It comprises a low eight-wheeled trolley, upon the deck of which rails are laid outside the narrow gauge. The broad-gauge wagon is run upon this deck and made fast, and together with its contents carried over the narrow-gauge system to its destination, short length standard-gauge sidings being provided at every station, where the trucks can be run off the transportation-car for unloading or loading. Some idea of the saving in cost possible by such method, which obviates transhipment of goods in passing from one gauge to the other, may be gained from the fact that in this particular case it averages half-a-crown per wagon.

AN IMPORTANT BLASTING INVENTION.

The attention of mining circles has recently been directed to a new invention the object of which is to secure the positive detonation of blasting-charges. The cartridge for insertion into the shot-hole is fitted with a tube-end, which in turn has a loose central needle. When the cartridge is placed in position the hole is rammed in the usual manner, the needle is then withdrawn from the tube, and in the space thus left the detonator attached to a special carrier is inserted. The charge is then fired electrically in the general manner. Should the cartridge fail to explode, however, instead of remaining dormant until accidentally struck by a miner's tool, the defective detonator can be removed, and another inserted and connected up to the cartridge as in the first instance. Such an invention, it is anticipated, will result in a decrease in the number of accidents arising from cartridges which, having failed to explode, detonate unexpectedly when inadvertently struck, thereby precipitating disaster. Although pre-eminently suited to coal-mining operations, it is equally applicable to general blasting in open quarries.

PRESERVATION BY PASTILLES.

In describing a new specific in a recent issue (under the above heading), some confusion has been caused by our reference thereto under the designation of 'tabloids,' the inference being that this was a product of Messrs Burroughs, Wellcome, & Company, who are the registered proprietors of the trade-mark. Such, however, is not the case, the terms 'tabloid' and 'tabloids' having been used in association with the invention by inadvertence.

A VILLAGE BY NIGHT.

White night of stars, and huddled roofs all gray,
Mysterious trees, and gardens chill a-row,
Blank doors and windows on the straggling way,
Save where the inn's red-curtained windows glow
With cheerful ray.

Sudden, a flood of light, a noisy din,
Tired, heavy feet which stumble as they go,
Closing of doors, and jar of bolts within,
Then wave on wave of silence, as the low
Night winds upwin.

Cry of a night-jar from a distant field,
Nearer, swift water flowing out of sight,
And, close at hand, a beetle's hum—all yield
Into the awesome silence of the night
When earth is healed.

HIS INHERITANCE.

By SUSAN BALLARD, Author of *An Open Door.*

CHAPTER I.—THE INHERITANCE IS LEFT.

IT was early in the eighties when William Lauder landed in Japan. Coming out to join a well-known business house, he was at once invited to join a 'chummery' of young men; but he was a man who shrank from society, and he preferred setting up in a small house by himself. He made few friends, and it was lonely work the setting out in the morning without a word from any one but his servants, and the returning in the evening to an empty house. No one was surprised when, after he had been a year in Japan, he married a Japanese girl, the daughter of his language-teacher.

Having sometimes had occasion to go to his teacher's house, he had there seen O Yone San, and had at once fallen in love with her smiling face and gentle ways. The English girls in Yokohama with whom he had a slight acquaintance were much too grand for him; he felt that he could never satisfy one of them, nor did they attract him in the way that this dainty little person did. She seemed to demand so little and to be willing to give so much; he knew that life would have a new charm if he could possess himself of her companionship and sympathy.

When he broached the subject to Mr Uchida, O Yone San's father, the good man was naturally not a little surprised, the abruptness of the proposal was so foreign to his ideas of what was correct. He ought to have been approached through a go-between, who would have talked and consulted and arranged in the leisurely way so dear to the Japanese mind. But William Lauder knew nothing of these niceties. He wanted the girl, and had no intention of being leisurely. He soon convinced the father that he was in earnest. He made it clear from the beginning that he was going to act straight; that the marriage was to be a proper legal one, and he was prepared to settle on her what was great wealth in the eyes of the quiet little Japanese household.

The girl herself was flattered by the attentions shown by her impetuous lover; they were so different from anything she had ever dreamt of in a land where courtship is in no way looked upon as a necessary prelude to marriage.

So they were married, and when the little household on the Bluff was increased by the arrival of a baby boy they were perhaps as happy as any couple in Japan.

But their happiness was short-lived, for when his child was only two years old William Lauder was stricken down with a fatal disease. When he knew that his days were numbered he directed his wife to send for an English missionary.

'You will wonder why I have sent for you, Mr Elliot,' he said to the grave-faced young man who came at his summons. 'I have never had anything to do with any of you missionaries, and you know that I have given up going to church. I have a great favour to ask of you; but I am a dying man, and I do not think that you will refuse me. I want you to become guardian to my child.'

The missionary looked surprised. 'Have you no personal friend here,' he said, 'whom you could ask?'

'No one that I care to ask, no one that I trust as I would trust you. Men out here often avoid missionaries; but a business man generally knows whom he can trust, and if you say that you will look after my child I shall die in peace, for I trust you, and know that you will keep your word.'

'How do you wish him educated,' said Mr Elliot—'as a Japanese or an Englishman?'

'He is an Englishman,' said the dying man; 'but it would be cruel to take him from his mother and send him to England; besides which, I have no one there I care to send him to. He must live with his mother, so he had better have the

 [*All Rights Reserved.*]

usual Japanese education; but remember he is an Englishman, and when he has finished school here he is to be sent to England, for I want him to know the land of his fathers. I don't think that there will be any money difficulties; the land I have bought in Yokohama is already rising in value, and, if I am not mistaken, it will bring in a tidy sum in a few years. I have thought a lot about the child since I have been ill. He is only two, so it is too soon to be able to tell whether he is most English or Japanese. He inherits both natures from his parents, and I am afraid that it is an unhappy kind of inheritance; different nations have their different ideas, and the two natures are bound to clash somewhere. I understand that better now than I did before, and it makes me anxious for the child. When a man marries he only thinks of himself and his own happiness; he does not give a thought to those whom he may bring into the world. You would be doing a deed of great kindness, sir, if you would promise your help to the child.'

Shall we call it one of the burdens or one of the joys of missionary life that those who show least sympathy for mission-work so often look to the missionary when in serious trouble? Before Mr Elliot left the house he had solemnly pledged himself to the guardianship of William Lauder's wife and child. He knew that the charge would probably involve considerable anxiety, but he could not refuse.

'I want my wife taught Christianity,' said William Lauder. 'She has often asked me about it, and I meant to have her instructed, but somehow I kept putting it off. But I had the boy baptised. His name is Robert Hideo Lauder. As he is to live with his mother he must be brought up as a Japanese, but he must remember that he is an Englishman. No one can tell which of his two inherited natures will prove the stronger. I pray that they may not bring unhappiness to the child.'

CHAPTER II.—HIDEO.

AFTER William Lauder died his widow went to live in Tokyo with her parents. None of the neighbours there knew anything about the English husband, and she was known by the family name of Uchida. Little Hideo was too young when his father died to remember him, and had it not been for the connection with Mr Elliot the child would hardly have known that he was in any way different from his school companions. Mr Elliot, however, was determined to carry out faithfully the promises made to the dying man. He arranged that every year during the summer holidays Hideo should go to an English family, so that he might at any rate speak English properly as he grew up.

As William Lauder had predicted, the Yokohama property rose enormously in value. Mr Elliot kept impressing on Hideo's mother that she might apply for whatever money she wanted; but her wants were few, and she knew that whatever money was not used was laid up for her boy, so it was her delight to be economical in order that he might have the more when he grew older.

The years passed rapidly and uneventfully away. Hideo's grandparents died; but he and his mother continued to live in the pretty little Tokyo house, Hideo attending school daily and receiving the education of a Japanese boy. His English blood showed itself chiefly in his love of bodily exercise; whether it was boat-races on the Sumida river or the school tennis, he threw himself into everything with heart and soul. His mother sighed over his queer tastes when she saw the hot and dishevelled state in which he would come home, and she thought regretfully of the sedentary lives led by the young men she had known in her youth.

It was one evening when Hideo was twenty years old that his mother broached a subject to which she was giving much anxious consideration. They were sitting by the box of charcoal, Hideo intent on a book.

'Hideo,' said his mother, 'did you know that Colonel Shiga has died leaving four daughters?'

'Indeed?' said Hideo, without looking up.

'They are very charming girls,' continued his mother.

'I have no doubt of it,' replied Hideo. 'He was a distinguished officer.'

'Hideo,' said his mother entreatingly, 'please lay down that book. I wish to speak to you on a very important subject.'

Hideo was startled by the tone of his mother's voice. 'What is it, mother? Do tell me.'

'Hideo,' said his mother, 'I can't tell you how anxious I am about your future. I often lie awake at night wondering what would happen to you if I should die before I could find a wife for you.'

'A wife!' exclaimed Hideo. 'Surely you do not want me to get married now?'

'No, no,' said his mother hurriedly. 'Of course there need not be any great haste about the marriage; but I should be so happy if I could get a promise made between you and some nice girl. And then,' she continued pleadingly, 'remember, Hideo, in three years you will be starting for England, and who is to take care of me when you are away? If I am left all alone I shall be so unhappy! The eldest of Colonel Shiga's daughters is such a sweet girl! I have made inquiries about her in every direction, and I hear nothing but praise of her. You may never get such a chance again. As long as there is no marriage settled for you I feel as if I were failing in my duty as your mother, and you have no idea how often I think about it and how anxious I feel.'

'I am very sorry that you should have so much anxiety,' said Hideo. 'Of course I have sometimes

wondered what was to become of you when I went to England, but I confess that I have not thought of marriage for a long time to come. Have you talked to Mr Elliot about the matter?'

'No,' said his mother with a sigh. 'I am afraid that it will be rather difficult to make him understand. The English have such strange ideas about marriage. I learnt that when I was with your father. They think that a man ought to go about and pick out his own wife; though how in the world you would begin to look for a wife for yourself, Hideo, I am sure I can't imagine. People would laugh if they heard you going and asking questions about the young girls. Now, an old woman like me can go asking any questions she likes. People know quite well that I am thinking of a wife for my son, and they give me every help; but for a young man it would be absurd. Besides which, you would not know what sort of inquiries to make.'

'Quite true,' laughed Hideo. 'I expect that I had better leave it in your hands; but you must not make any promise without letting me see the girl.'

'No, no,' said his mother earnestly. 'Of course you must see her, and if you do not like her looks we will get some one else. I will go to-morrow and talk to Mr Elliot about the matter.'

On the following morning Hideo's mother got herself up with great care. She put on her best *kimono* and her black cashmere *haori;* in her hand she carried a large box of cakes tied with the red-and-white string which is the indispensable sign of a present.

Mr Elliot had been long enough in Japan to know by her appearance that something of importance was on the tapis; but he was much astonished when, after some preliminary talk about the weather, his visitor plunged into the subject of her son's marriage.

'Surely he is much too young to think of such a thing yet?' said Mr Elliot.

'Indeed,' said she, 'I have known numbers of young men who were married when they were twenty-two, and it would be such a happiness to me if Hideo were to marry before he went to England. Just think how lonely I shall be while he is away; but if he leaves his wife with me I shall not mind at all; and it will be much happier for him too, for he can stay in England with a quiet mind, and feel no anxiety on my account.'

'You must remember,' said Mr Elliot, 'that Hideo is partly English, and Englishmen always like to choose their own wives. What does Hideo think about the girl you speak of? Has he ever seen her?'

'Oh,' said the mother, 'you do not think that I would want Hideo to marry any one he disliked? I shall arrange for him to see her several times before the promise is made. But what can a young man know about a girl? He only sees her face; he does not know her real nature in the way we women find it out.'

'Well, I can't think that it is a happy thing for him to be tied down so young,' said Mr Elliot. 'Supposing he were to fall in love?'

'Oh no, no!' said the mother in a horrified tone. 'I assure you my Hideo is not at all that kind of young man. He never goes near the geisha-girls.'

'Geisha-girls!' said Mr Elliot. 'I don't mean that kind of thing at all. When I say that Hideo might fall in love I don't mean anything bad. You surely know that most Englishmen fall in love before they marry, and I see no reason why Hideo should not do so.'

Hideo's mother was silent. To her mind falling in love meant some tiresome entanglement with a geisha. A young man's duty, she considered, was to fall in love with his wife after marriage.

Mr Elliot felt that it was no good arguing the matter, so he said that he would like to have a talk with Hideo.

In the course of a few days Hideo came for the appointed interview.

'If you were an ordinary Japanese young man, Hideo,' said Mr Elliot, 'I should advise you to fall in with your mother's views; but the difficulty is that, as you are partly English, I am afraid that you may have some of the feelings of an Englishman.'

'I know what you mean,' said Hideo calmly. 'You think that I ought to fall in love in order to marry. I know that that is the English idea; but then, you see, I do not agree with it. I don't feel as if I should ever fall in love, and I don't want to do so.'

'No?' said Mr Elliot. 'But then Englishmen don't fall in love because they want to do so, but because they can't help it. I suppose you have had no conversation with the girl your mother speaks of?'

'Oh no,' said Hideo. 'I have only seen her once, and that was in a room full of people; but my mother says that she is very *yasashii*.'

Mr Elliot knew that when the word *yasashii* was applied to a girl it meant that she was sweet, amiable, obliging, and altogether desirable. No higher praise could be given.

'Then you really want to marry her, do you, Hideo?' said Mr Elliot.

'Oh dear, no,' said Hideo. 'I don't *want* to marry at all; but of course I can see the force of what my mother says. It would certainly be a great worry to me when I am in England to feel that she was all alone. If I marry I shall know that there is some one to look after my mother, and I shall be able to pursue my studies in England with a free mind.'

It was almost inconceivable to Mr Elliot that a young man should be willing to marry in order to provide his mother with a companion while he was absent. He thought of his own tempestuous courtship, and wondered what his wife would have said had any one suggested that she should stay with her

mother-in-law while he went away for a couple of years. But he felt that it was no use continuing the conversation. After all, Hideo was partly Japanese, and meant to spend his life chiefly in Japan, so why should he not marry according to the Japanese custom?

'Well, Hideo,' said Mr Elliot, 'I see that you and your mother think alike in the matter. I beg, however, that you will be in no hurry to decide. Think it well over.'

Hideo walked away, feeling, like his mother, that the English were a difficult people to deal with. 'They always go on about the same thing,' said he to himself, 'whether it is their novels or their plays or their poetry. There is always the same one idea about falling in love; either the man falls in love, or the woman falls in love, or they both fall in love, or else the difficulty is that they don't fall in love. Really it is monotonous. Besides which, it is so untrue. I know lots of happy marriages where they never thought of falling in love till after they were married.'

He began to think over some of the married couples he knew. Yamada! Yes, Yamada was certainly very happy, and he had only seen the girl he married once before the engagement. Takeda! Well, no, the Takeda household was not very happy. That was because Takeda would keep up his connection with some geisha-girl. Hideo felt that he would give his wife no anxiety on that score; he had always looked upon the geisha as one of the plague-spots of Japan.

Then he thought of the Saitos. He knew that Saito was devoted to his wife, but the household were not very peaceful, because the wife and mother-in-law did not agree. 'After all, the women are together all day, and the man is out most of the day,' thought Hideo, 'so it must matter a great deal to them whether they are congenial or not. Yes, my mother is quite right. I should never know how to choose a wife for myself, in spite of what the English say, so it is really much better that she should arrange it for me.'

There was a learned American professor who was engaged to lecture on literature in a Tokyo College. Three of his students came one afternoon to call upon him, for the professor was a kindly man, and was always willing to have a little literary talk with them. 'Well, gentlemen,' said he when they were seated, 'is there something about which you wish to consult me?' 'Sir,' said the spokesman of the party, 'we wish you to explain to us the nature of love.' The professor rose, and, bowing, opened the door. 'Gentlemen,' said he, 'I am here to teach you the nature of literature, not the nature of love.' Hideo was in the same state of mind as these young men. He would willingly have attended a lecture on the nature of love, if it could have been explained and demonstrated like electricity, or radium, or any of the other of nature's forces. The stories of impassionate love which he had read in English books seemed to him quite unnatural. That love has a force which might some day lay hold on his life was an idea that did not for one moment enter his head.

(To be continued.)

THE NEW BRITISH ARMY OFFICER.

By Rev. E. J. HARDY, M.A., Chaplain to the Forces,
Author of *How to be Happy though Married*, *Mr Thomas Atkins*, &c.

IT is a long time since the British army could be truthfully described as 'an army of lions led by asses.' Indeed, if an army is what the officers are, there is much hope for our army. The Boer war taught such a lesson that there is no profession now that works harder than does the profession of arms in Great Britain. The microbe of energy has bitten almost every one in it, and an officer now who does not lead a strenuous professional life must go at least on half-pay. Witness what happened in the Fifth Lancers.

Not long ago, when sitting down to have my hair cut at Trufit's, in Stanhope lines, Aldershot, I asked the man to use a hair-cutting machine. He said that he had none, and that if he had it would be no use. 'How is that?' I asked. 'Because,' he answered, 'the officers, who are the majority of my customers, have no hair to cut, or not enough for the machine to take hold of; it has been worried off their heads, and nearly every one of them is getting bald. The seniors worry the next seniors, and these the juniors, for every officer must now be busy, or pretend to be.'

Every day at our military stations officers may be seen teaching men how to shoot, signal, and so on, just as sergeants used to do. They have also frequently to give lectures and take part in night-attacks. The majority of our officers in the past were not professional. They took it easy during peace, and trusted to courage to pull them through in time of war. Now they take their profession seriously.

For remuneration not much better than that of a clergyman—and no living wage can be less than this—the new British officer is expected to know something of everything and everything of something: to take a vital interest in the food, work, and amusements of his men; to have the temper of a saint and the tact of a diplomatist; to know what to do in times of difficulty and danger, and never to be wanting in common-sense and power of command.

The up-to-date army officer must study hard but

not be a bookworm. What is required of him came out in evidence in a recent inquiry about ragging, and it certainly was a good deal.

The shorter the service is for the rank and file the more necessary it becomes to have well-trained officers. 'Better,' said Napoleon, 'is an army of deer commanded by a lion than an army of lions commanded by a deer.' A partially trained army cannot be made fit for war in a short time without able officers.

The examination system which the Chinese are giving up after trying it for more than five thousand years has come to our army with absurd intensity. The outlook of a young officer is a series of examinations. It is not because our officers are deficient in mental ability and vigour that they dislike these ordeals. Indeed, many of them are fond of study, and pass examinations for promotion as well as those in languages with great credit. They do not like, however, to have examinations held over their heads like a whip, and made to cause uncertainty and anxiety.

Nor is it only the British taxpayers who are beginning to exact much from the army officer. If he is not proficient his own men soon find it out and cease to respect him. The rank and file now take much interest in their work, especially on manœuvres. Returning from a hard day's work last autumn, two privates discussed what had been done. At length one pulled a map out of his pocket, and, pointing to a place on it, said, 'There's where our —— officer put us wrong.' The rank and file know now more than they used to know, and one of the things they know is that 'an ignorant officer is a murderer.'

An officer is not popular either with his brother-officers or with the men unless he is a bit of a sportsman, and has, at least, sympathy for their games. Nor is there anything that tends so much as field-sports to fit him for his work. The ladies, too, want him in society, so altogether he has plenty to do with his time.

The editor of a well-known magazine told me that there was no class of men from whom he liked to get manuscripts more than from British officers. 'They are so natural and so healthy-minded,' he said. Probably it is their partiality for sport and their open-air lives that make them like this.

To get on in his profession, an officer must be as hard as nails physically, and have his head properly screwed on. Above all, he should have common-sense and take a cheerful, healthy view of life.

'The man who goes to sea,' says Montaigne, 'and the man who marries a wife must put up with whatever happens.' The British officer knows now as he never did before that he must prepare himself for whatever happens in war, and he sacrifices his comfort and leisure to do so. He roughs it, generally at his own expense, in off-the-beaten tracks in countries the languages and characteristics of which he thinks it advisable to learn.

The German officer may know more of the theory of his profession, but in many respects the British officer is his superior. In one respect the latter is certainly superior, and this was pointed out to me by a German officer. 'I cannot understand,' said this gentleman, 'how British officers can play games with their men, and in other ways associate with them. I wish that we could do so, but we could not without destroying discipline.' The British officer plays games with his men as a master at a public school plays them with boys. He has also learned from his public-school life how to influence and command.

It is rather difficult now to get officers of the right stamp. Young men with money will not be 'put upon' by the authorities, and those who have not independent means prefer to go into professions or businesses where, for probably less work, they can make more money. Lately I asked a youth who had plenty of money and muscles why he did not join the army. 'Because,' said young hopeful, 'I would not like to have to salute a superior officer.' We hope that this sort of young man is not becoming common.

People say that the army is a poor profession; but there are many possibilities in it, and we think that for an ambitious, able, and hard-working man no other profession at the present time, except perhaps the Bar, holds out such good prospects. An officer begins to earn something when very young, and if he has any private means in no other position in life can he put them to a better account. When we hear of the poverty of the clergy, of the average annual income of barristers being only thirty pounds a year, of medical men sitting on roadsides waiting for motor-car accidents, the profession of arms does not seem so bad. Still, we should remember that the pay of the British cavalry and infantry officer has not kept pace with the times. It is, in fact, the same as it was when the purchasing-power of money was much greater. We will never get a good army if we squander money upon privates (ten shillings a week is too much pocket-money for a youth of eighteen) and stint commissioned and non-commissioned officers.

It is a good thing to get gentlemen from the universities and elsewhere as well as from Woolwich and Sandhurst, because in this way we avoid the sealed-pattern type of officers. Certainly, officers themselves are not very tolerant of those who do not conform to the customs and unwritten laws of the service. If one member of a mess gets a new coat or hat it must be like that of every other member. The consequence is that even when not in uniform all officers look alike. There should be a little more liberty and respect for individuality.

British army officers are said to be less modest and unselfish than naval officers; but in our experience they have not less of the true gentleman's dislike of asserting himself. You may associate for a considerable time with an army officer without finding out from himself that he had travelled much in unknown and dangerous lands, or had won

a Victoria cross. The other day at a function in Spain I saw a Spanish officer's right side from shoulder to waist covered with peaceful decorations —he had not one war-medal. These he proceeded to show off and explain to his friends in a way that would have been impossible for one of our officers.

It is, no doubt, this self-effacing spirit in the British officer that causes him to dislike to be made conspicuous by uniform. Gold lace and feathers have no attractions for him, and as he has no intention to suffer in order to be beautiful, he gets into mufti the moment his military duties are over. This, we think, is a mistake. The romance of war should be kept up. Soldiers should be dressed handsomely during peace, and allowed to wear during war any kit in which they can most conveniently fight.

An army officer looks forward as much as does a naval one to the time when he will be able to retire and have a cottage or 'little place' of his own. Some, however, who leave the service with only a small pension, and have little money of their own, scarcely know to what to turn. Many try to be wine-merchants and farmers; but it requires more than a taste for good wine and for field-sports to make these pursuits pay.

Certainly something more should be done for retired officers. Could not appointments in the Civil Service be given to those who are fitted for them? The worst thing in the profession of arms is the waste of human ability caused by the fact that the average officer has to retire from the army when only about forty-eight years of age. He has just enough pension to keep him idle, and perhaps even this will eventually be taken away. Some aggressive member of Parliament may want to know why the past army, by reason of pensions, costs nearly as much as the present one.

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire, How England Saved Europe*, &c.

CHAPTER XXX.—IN THE FRENCH CAMP.

LATE on the sixth day the old sheikh, who was riding at the head of the party, suddenly stopped and sat with bent and listening head as though to catch some far-off sound. The whole band halted, and more than one scrambled from his camel and stooped with ear to the ground. Then they talked eagerly together, with many gesticulations. Presently Jack himself could hear a faint, deep sound; it seemed high in the air, and rose and fell as if in waves. He recognised the sound at last. It was the far-off thunder of guns. It presently died away. But he knew that what he had heard was the sound of the French batteries in front of Acre.

From this point the curving sea-horizon stretched before them, the sea itself lying like an azure lake, pricked with the white of sails at a dozen points. Just before sunset, as they rode to the summit of a gentle incline, Acre came in sight. The whole scene lay in the sunset haze like a map; the low point, like the blunted head of a spear, thrust out into the sea, and crossed where it joined the land by a line of low, gray crenellated walls. On either flank some warships were lying at regular intervals, so as to cover the approach to the walls with their guns. In the foreground were squares and parallelograms of tents—plainly the French camp. Betwixt the tents and the walls of Acre were the French batteries.

As they gazed on the scene some faint jets of smoke were visible from one of these batteries; then came the sullen blast of the guns. A splash of sudden flame from two or three points in the walls answered the French battery.

The Arabs rode steadily across the plain towards the camp. A dozen groups—some on donkeys piled with trusses of hay, some on foot with tiny droves of cattle and goats—were converging towards it. A squad of cavalry rode out as they came near, but went past without taking any notice of them. Jack scanned them eagerly, the brown, reckless faces, the faded uniforms, the glittering scabbards. Presently, as they reached the camp, there was a sharp challenge, '*Halte!*' and a French sentry stepped from the shade of a tent into the middle of the track. He was a little man, his face burnt brown with the sun, his uniform ragged, his long boots broken and tied with string. But the attitude was alert, the challenge sharp, the eye keen and bold; and, while he wore nothing of the gay trappings of a holiday-soldier, his musket was clean and the bayonet flashed brightly in the sun.

Jack looked curiously at the little martial figure, with the ragged dress and the alert and masterful look. He was a new type of soldier, and one quite undreamed of at Brienne; the soldier not of the Bourbons but of the Revolution. Nay, as Jack gazed he realised that the sentry belonged to a more formidable type still. He was something more than the product of the Revolution, just as the hard basaltic rock is something different from the red lava shot from a volcano. This was a soldier of what the alarmed world was beginning to know as the Napoleonic type—the type that had overrun Italy and broken the pride of Austria, and was to do still greater things not yet dreamed of.

Meanwhile the Arabs had drawn together. The young fellow who spoke, or tried to speak, French was thrust to the front, and a corporal at the

sound of voices came forward. Jack broke in on the group, though the old sheikh tried to keep him back.

'I am English,' he said. 'I was shipwrecked ten days ago, and have fallen into the hands of these fellows, who shot my companion. Frenchmen,' he added, 'respect misfortune.'

The corporal threw up his hand in salute.

'*Oui, monsieur;* but you must tell the officer of the guard your story.'

The officer of the guard was summoned. He was a man past middle life, with grizzled moustache, sullen brows, and bitter mouth. Jack recognised the type; he had seen it often on the Boulevards of Paris. Lieutenant Ricord was one of the dark spirits of the Revolution, a Jacobin somehow turned soldier. He had probably fought at Valmy against Brunswick, and had kept some of his revolutionary ideas under the suns both of Italy and Egypt. He glanced sourly at Jack as he listened to his story.

'What were you doing,' he asked curtly, 'in Egyptian waters? Are you an officer?'

'No, a civilian.' Jack hesitated a moment, then added, 'In the employ of the Foreign Office.'

'*Un diplomat!*' said the officer contemptuously.

Meanwhile the old sheikh had thrust forward his interpreter, who explained that the Englishman was their prisoner, and had been brought to the French headquarters as he and his despatches were of value, and the French would no doubt pay well for them.

'The General must see you,' decided the officer. And Jack was marched under guard through the camp, the old sheikh and his interpreter following.

The camp was drawn out in orderly lines, but it seemed to the wondering eyes of Jack full of disorder. Soldiers were lying about playing cards; women were abundant, most of them young black girls. There was much screaming and shouting. Jack was astonished to see so few men in camp; there seemed more girls and camp-followers than soldiers. Corporal Lebrun, who marched beside him, explained that the General had gone out to join Kléber, who was marching at speed to intercept a big Turkish army—'thirty thousand strong,' Corporal Lebrun added—striking at their communications from the eastward.

The little group halted in front of a tent before which a sentry patrolled, or rather lounged. The officer led the way in, Jack following, and with a careless salute told the prisoner's story. General Dugua was courteous but brusque. Jack explained that he was known personally to the Commander-in-Chief, had been a fellow-student with him at Brienne, and was sure of his good offices.

'You shall see him when he returns to camp.' Then, glancing at Jack's bandaged arm, the French General asked, 'Are you wounded?'

'No; but my arm was broken in the shipwreck.'

'A surgeon shall see you at once; but,' he added, do you give your parole?'

'Am I a prisoner?' asked Jack with some indignation. 'I am a non-combatant, flung into your camp by accident and against my own will. Do you treat me as a prisoner?'

'Yes, until your case is dealt with. You must either be kept under guard or give your parole.'

Jack hesitated for a moment, then gave the required pledge, and went off in company with Corporal Lebrun to the hospital tent, leaving the old Arab sheikh and his interpreter in eager conference with the General. At the hospital tent his arm was examined by a gray-haired surgeon. He took off poor Grant's splints and felt the arm with skilful fingers.

'You are a fortunate man,' he said. 'The best surgeon could not have set the arm better. The junction of the bones is perfect; there is no inflammation. I will put new splints on, but these have done their work perfectly.'

Jack told the story of how poor Grant bound up his arm. A cluster of surgeons gathered round and examined the bandages and the splints curiously while they listened.

'An English seaman made these splints with a knife,' at last said the surgeon. 'It is wonderful. A bit of wood, a knife, and the lining of a coat, and the best surgeon in Paris could not have done it better. Monsieur,' he repeated, 'is fortunate.'

The next day—it was April 17—a cavalry officer with an orderly came riding at speed into the camp. His uniform was white with dust, but his face was smoke-blackened, and there was a bandage round his forehead. He brought news from the Commander-in-Chief, and the tidings ran through the camp like wildfire. A great victory had been won at Mount Tabor. The Turkish army had been destroyed; it was nothing short of a massacre. The guns in every battery fired a rejoicing salute, and were answered sullenly from the walls of Acre.

The next morning Bonaparte and his staff came riding in, and the whole camp was a tumult of cheering. Jack stared at his old comrade with eager eyes. He was older and stouter than when he had last seen him, the yellowish complexion was burnt a deep brown, but the look of command on his features was unmistakable. A score of battles had written their signature on them indelibly. Behind him was his staff, a group of men with names famous already, but destined to be memorable. Marmont was there, Lannes, Davout, Lefebvre, Desnouette. It was a cluster of keen and fighting faces, with the smoke of battle still upon them. They were excited, calling with laughter to each other as they answered the salutes of their comrades; but Bonaparte rode ahead, a figure inexplicably different from the rest. His face wore a fixed air of absorbed command. He seemed to be looking at something beyond the shouting crowd about him. The forward look, the impassive features, were curiously impressive.

Suddenly Bonaparte pulled up his horse and fixed his eyes on the walls of Acre. A Turkish flag

was flying from the summit of the tower, and as the wind blew its folds open a crescent could be seen on it. Then came a spark of red flame from a gun on the tower itself. The Turks were firing an answering challenge to the tumult of the camp. Bonaparte's forehead was knitted for a moment into a black and answering frown. The line of broken, stubbornly held wall stretched betwixt him and his dreams.

With Bonaparte's arrival the French camp was stirred into instant activity. All the afternoon the guns from the batteries thundered angrily. At night, as he lay in his bed in the hospital tent, Jack heard the steady tramp of feet go past. Presently there was a roar of musketry at the foot of the great breach. It was a night attack, and Jack hurried from the tent to watch. There was a quick, sustained flash of musketry running along the foot of the wall, a hundred spear-points of fire darting upward. This was the French attack. The spray of red upward-darting points climbed like an ascending wave, with many quick ebbs, almost to the parapet of the walls. The French were succeeding. At one point in the walls the spray of fire ran wedge-shaped to the very crest.

'That is the breach,' said the surgeon, who stood near; 'and,' he added, with excitement, 'our men are winning.'

But the edge of answering fire from the summit of the walls—countless points of *downward*-thrusting flame—never ceased, while from either flank the warships were thundering on the attacking columns. The line of musketry fire that marked the French advance seemed to shrink. It sank backward. The attack had failed.

Presently the columns came back broken and confused, and details thronged in with wounded men to the hospital tent. For hours the surgeons were busy. Amongst the wounded Jack found his friend Corporal Lebrun waiting, with a broken arm, for his turn with the surgeon.

'We have attacked twelve times already,' he explained. 'This was the thirteenth time. I knew it would be unlucky.'

Jack smiled at this sign of superstition in a French soldier who looked upon religion itself as a sort of exploded shell, something to be thrown away. It recalled his old schoolmaster Lepitre.

'The rascals,' Corporal Lebrun went on, 'attack us almost as often as we attack them, and the guns of your ships take us in flank when we try to climb the breach. Acre,' he added bitterly, 'is defended by Europeans, and we are attacking it *à la Turque*.'

This Jack found out afterwards was the bitter and common jest of the camp; but when Kléber at last used the phrase to Bonaparte it was an unforgiven and unforgotten insult.

Late the next afternoon Jack was told that the General would see him. An orderly took him to a large tent, in front of which a flag was flying; a sentry stood on guard with an unsoldierly air of ease; a sergeant's guard lounged in a tent close by. Jack entered the tent. At the table sat an officer in the uniform of a general of brigade; Bonaparte was standing, his hands behind his back, in an attitude which painters have made familiar for all time, his head bent in meditation. He looked up as Jack entered, but gave no sign of friendliness. His eyes dwelt on the sea-stained dress Jack still wore and his generally battered aspect.

'Well,' he said at last, 'this is worse than Brienne or Paris;' and a smile for an instant lit up the dark face.

Jack told the story of his adventures, while Bonaparte listened without comment.

'You should have accepted my offer,' he said at last. 'You flung away a career when you refused it. What do you want me to do?'

Jack felt chilled by the coolness of his old comrade. 'I am not a prisoner,' he replied. 'I was cast ashore by the wreck of my ship, yet I have been required to give my parole. I have a right to ask that you shall send me under a flag of truce to one of the British ships.'

General Reynier, who was sitting at the table, and had been watching Jack, at this point whispered something in Bonaparte's ear. Bonaparte shook his head, but Reynier persisted, whispering eagerly, while Bonaparte's eyes dwelt with a moody look on Jack.

'I am busy,' at last he said abruptly. 'I must inquire into the matter.' And Jack found himself dismissed.

Something, it was clear, had been suggested by Reynier—something mysterious affecting himself—and Jack puzzled his brain over the subject. Bonaparte had not shown any signs of friendly feeling. He seemed to have forgotten the ties of old days. But why should he keep him a prisoner, and what was it Reynier had whispered in his ear?

(To be continued.)

BIRD-WATCHING AT THE LIGHTHOUSE ON THE FLANNAN ISLANDS.

IN *Chambers's Journal* for 1899 Mr W. J. Gibson gave an account of 'A Visit to the Seven Hunters' or Flannan Islands, the group of seven rocky islands which lie about twenty miles west of Gallon Head, Lewis. On the largest of these islands, precipitous on all sides, known as Eilean Mòr, a lighthouse is built, where Mr Begg, once the head-keeper, has been a keen and interested observer of the bird-life, native and migratory. The present paper is based on the interesting and valuable observations made by him during several years' residence on Eilean Mòr. There are no quiet, shell-bestrewn bays on these islands where boats may land easily; the sea lashes the cliffs hungrily and angrily in storms, and with some difficulty a safe landing is made. Eilean Mòr stands two hundred and eighty-two feet above the sea at its northern edge, and two hundred feet at the south, and is a grassy plateau of about sixteen acres, forming good grazing-ground sloping gently to the south. Sea-fowl breed on its cliffs in great numbers; while the migrants, resting on their journey, shelter in the long grasses and amid the rifts in the steep faces that flank the island on all sides.

The attention of naturalists was drawn to these islands by specimens captured during spring and autumn migrations and submitted to the Natural History Department of the Royal Scottish Museum, Edinburgh. It was found that a large stream of migrants passed over the island twice yearly, in spring and autumn. Mr W. Eagle Clarke, keeper of the Natural History Department of the Museum, who has made observations at Fair Isle many times, on the Eddystone, and on the Continent, visited the island, where he spent more than a fortnight in the autumn of 1904. During this September visit eighty-two species were observed, twenty of which remain on the island to breed. Experts were surprised at the number of species and individuals which passed there annually between northern and southern latitudes, considering the extreme westerly position of the islands. The first record for the Hebrides of the pied fly-catcher, dotterel, and other species was made here; three of the former little birds were observed merrily catching flies on the most precipitous part of the cliffs. On one stormy morning Mr Clarke raised hundreds of jack-snipe—the island was infested with them. They crouched behind every tussock, stone, and bush, and only those rose which lay in his line of march. He says that a sportsman making a bee-line from one side of the island to the other could have made a phenomenal bag that day, taking only those birds which happened to be in his path.

Among the small birds which inexplicably sweep round the western shores of Scotland are the starling, chaffinch, linnet, snow and Lapland bunting, wagtail (pied and white), garden warbler, blackbird, and redbreast. Among the birds of prey the merlin is the most remarkable, although the smallest. It is a little pirate, and exists at the expense of its small fellow-migrants.

The birds which breed on the cliffs are much the same as those found in St Kilda, Orkney, and elsewhere. To this island the local and beautiful fulmar petrel has wandered from St Kilda and established a small colony. The greater black-backed gull is here; but, luckily for the birds he preys on, the number of these rapacious scavengers is small. This bird has been seen to attack and hold under water puffins and razor-bills, and when these were drowned to devour them greedily. It takes any kind of egg, chick, or putrefying carcass. Mr Begg remarks that from the two or three eggs this bird lays, one chick only as a rule comes to maturity. The herring-gull is another sinner whose self-indulgence has led it into habits of robbery. It breeds in numbers on each island, and feeds its young on the contents of its stomach, consisting of offal, decomposed whale, half-incubated eggs of the guillemot, razor-bill, and various sorts of fish. The peregrine falcon is the most interesting of the feathered inhabitants. Its eyry can be smelt for many yards round, and its nest is surrounded by heaps of bleached bones. Mr Begg has never seen this bird attack anything meaner than a puffin, which, with razor-bills and guillemots, is its staple diet. He has seen this princely falcon fighting the king of crows, the raven. The peregrine would soar above the raven, swoop down, strike it, and tear it to pieces. Mr Begg has twice captured peregrines which had flown to the lighted window of the lighthouse kitchen. This was not at the Flannans, but at Mull, and again at the Chicken's Rock, Isle of Man. When the young have attained something like adult size, what appears to the casual observer as a family feud takes place. This is merely the parental hint that the offspring must seek a living elsewhere—a hint of beak and talons not to be despised by any overweening youngster. The peregrine seems to have nested here ever since one of his generation took to puffin-hunting. Should one of a pair come to grief, a week will not elapse ere the other appears with a new mate.

The twite was discovered by accident when chasing kittiwake gulls. Mr Begg shot one for identification, and ever since they have disappeared as natives. They were always very shy and restless. Not so the rock-pipit or sea-lark. This bird, preyed upon by the merlin, took refuge in the sanctuary of the lighthouse; it is often seen entering the open doors to have a look round the floors. The wheatear is the earliest of the migrants; of an

evening the island may be deserted, while next morning it is alive with them. A few pairs remain; the rest continue their journey when night comes on. Such are the birds that come for the summer season; but by far the greater interest is excited by the mere birds of passage—birds travelling at night and alighting on the island and staying there till next evening to obtain food and rest. Many of these are stray visitors, which do not breed in Britain, and are included in the list of British birds merely on the strength of their having passed a day or so on an outlying island.

The white wagtail has been seen flying to the island literally with its last gasp, and lying down flat, with wings outstretched, and so exhausted that it could be picked up by the hand without protesting. The meadow pipits are very numerous in migration. An easterly or south-easterly wind on a dark night is a condition sure to bring them round the light-house lantern in great numbers. The dazzled birds are attracted in clouds to the light, and the death-rate becomes high among them. They arrive exhausted, and swarm over the island in search of their insect food. The merlins prey upon them, and some take refuge in Mr Begg's kitchen. They show little fear of man. Both the spotted and pied fly-catcher have been observed. The former was procured by Mr Begg on a telephone-pole, catching flies in its own peculiar jerky fashion. The swallow never arrives before the middle of May, and keeps passing over until June. Many alight only to perish; others recover from their fatigue after a rest, and skim over the grass in search of flies, which are caught at a height of two feet from the ground.

The starling is the only bird that Mr Begg would rather not see at the lantern. At times of migration flocks of thousands pass the island, seldom staying to rest. On a drizzling, dark night the birds seem to be attracted to the light; the starlings perch on every spot available, and a very dirty lighthouse they leave before they have departed next morning. The swifts, when they come, also roost on the lantern; but they prefer to hang on to some projection. They will cling to a suspended rope and swing backwards and forwards all night. 'The starling,' Mr Begg says, 'is the only bird I detest to see visiting us. They come at the light with such force that they kill themselves outright against the glass and astragals, spattering every place with blood.' Mr Begg disbelieves the statement that where the starling increases the skylark decreases. In the Hebrides, the crofts in Lewis support large numbers of both species living in all good-fellowship. He one day saw a starling perched on a cow's back tearing and boring at something. Quickly running up to prevent the starling from doing mischief, he found that the object of its attentions was the burrowing grub of some insect which it had already half unfleshed.

The hooded crow is a visitor of convenience. He comes when his food is plentiful—that is, when other birds are nesting. He has a waggish way of grabbing eggs, this freebooter. Approaching a broody guillemot from behind, he makes her so nervous by his presence that she leaves her egg, and, swoop! it is in his bill and away, to be shared perhaps with his mate in some quiet corner. A pair of ravens frequent the island, but do not appear to breed. If the pair tenanting the island are shot they are succeeded immediately by another pair. Ravens have divided the moors of Lewis for their own benefit, so that each pair have their own particular beat. This bird has the great black-backed gull to contend with, and mighty battles are fought; but both are cowards before the lordly peregrine.

The puffin is a well-known visitor here, as in other parts of the Hebrides, and is called 'Tammy Norry' and 'Ailsa Cock' in some districts. The name 'Coulter Neb,' which he gets in some places, is derived from his plough-shaped nose. They are partial to cracks in the rocks and holes under boulders. The nest is lined with fine grass, and the parent as she broods looks out through its hole to the open, where she usually commands a magnificent sea-view. If disturbed by a stick being poked at her, the bird waddles farther into the recess, and usually contrives to carry away her single egg. The puffin goes in for gay colours, especially about the head and legs, which latter are vermilion.

The next on Mr Begg's list is the fulmar petrel, which probably seven years ago migrated from St Kilda. Curiously enough we owe the spread of this bird, which was formerly confined to that island, to the spread of civilisation. Glasgow steamers make frequent visits there during the summer, and supply the minister and his flock with provisions. Formerly they were almost wholly dependent on the fulmars on their island, Hirta, as a means of food. These are now neglected for the Glasgow fare. The fulmars have increased and begun to found colonies in other spots. They have reached even to the Orkneys, where the colony is thriving under protection of the local landlord. The flight of these birds is marvellous, and mystifies the beholder. They swoop, skim, rise, and wheel in the most graceful flights, and scarcely betray any flexion of wings or tail to account for their motions. They have attained rare skill in the balancing art. Their food, too, is somewhat of a mystery, but probably consists of small marine animals floating on the surface. The parents secrete an oil with which they feed their young one, and the stomach is always found to be full of this oil, which has a musky smell.

Two smaller petrels breed on the island. One is Leach's fork-tailed petrel, and the other the famous 'Mother Carey's Chicken' or storm petrel, dear to the heart of every sailor. Of the former, about fifty pairs breed on the island of Eilean Mòr. The burrow may be from two or three to six feet in length, and six inches from the surface. The single egg is laid in a nest of dry grass at the end of the burrow. The birds are nocturnal, and fly about in

the dim, hazy evenings, uttering their twittering cry, often visiting the lantern. One thing Mr Begg remarks about the petrels is that they always have their legs tucked under them when on the ground—they never stand on their legs like other birds. This fact, which has seldom been imitated by taxidermists and figurers, must be borne in mind by visitors to museums, where these birds are often stuffed in an upright position.

The merlin is the smallest and most daring of the falcons. It chases birds larger than itself, such as the curlew or plover. It has been found in the coal-cellar, engine-house, or wash-house, where its quarry had taken refuge.

Mr Begg puts in a good word for the common buzzard. The name buzzard was a byword among hawk-fanciers of the olden time, owing to its vulgarian taste for small vermin; yet it belongs to a noble and powerful, if a somewhat lazy, species. It has been shot down mercilessly by keepers, who—according to Mr Begg, ignorant of the habits of this species—get twopence per head as encouragement. To be sure, it is probable that all hawks are tempted to eat up anything superfluous, maintaining the balance of nature. On one occasion a gamekeeper in Mull was bent on destroying a pair of buzzards which were breeding on a cliff. Mr Begg met him that day on his way, and, learning his murderous intent, expostulated. His expostulations had the good effect of making the gamekeeper reflect, and instead of shooting the birds he stopped to observe their customs. He soon saw what Mr Begg had wished him to see—that the buzzards supported themselves and family not on contraband eggs and protected birds, but on the vermin which were harmful to the game. As they were speaking one buzzard hove in sight dangling an adder which was securely held by the head in the bird's bill. This gamekeeper, in a very gentlemanly spirit, thanked Mr Begg gratefully for his warning.

A very shy corncrake, which, owing to the absence of much cover, forbears to 'crake,' was satisfactorily observed through the hole of a large box under which Mr Begg was crouching. The purple sandpiper arrives in flocks and feeds on the rocks, following the receding tide so closely that it often is floated off its feet by a wave. In storms they sit on one leg in the shelter of a lighthouse and preen the inaccessible parts of each other's plumage. They also are very tame, and gobble up slaters that are handed to them. Woodcock, snipe, and jack-snipe—the latter in such numbers that they afford excellent sport—are regular visitors. Whimbrels, which used to breed on the island before the workmen came, are now only migrants. Curlews are numerous, and are a great pest to the duck-shooter. Their sentinel stationed to warn the feeding flock by uttering his cry not only alarms the curlews, but also the ducks, which seem to know the note too. The curlews are confused by the light, and fly with great force to the glass. At Portpatrick lighthouse one of these birds broke through the glass, and was picked up alive, strange to say, on the floor.

The barnacle-geese come in great numbers in the autumn, and stay till the grass is consumed, when the great body leave the island, about fifty remaining till the next April. They are very shy, and consequently difficult to stalk. Mr Begg thinks that they hear the tread on the grass; for, approaching as he did out of sight and against the wind, when the birds could neither see nor scent him, they yet became uneasy and left off feeding. They are also capital meteorologists for those that can understand them. If they arrive early in autumn, winter will be stormy; if later, winter will be open; if at a mean between these two, about the middle of October, winter weather will be normal. Further, if they straggle over the islands there is good weather ahead, if they pack together storms are brewing, while their leaving the island altogether foretells storms and gales with hail and sleet.

If on a dark and stormy night the light of the lantern is the salvation of the mariner, to the feathered voyagers it is the greatest death-trap conceivable. They are like moths in their foolish flutterings round a candle. Those that suffer most seem to be passerines—blackbirds, thrushes, skylarks, and buntings. These hurl themselves with such violence against the wall that they are either severely wounded or killed outright. After a drizzling night Mr Begg in the morning has picked up scores of victims. Some birds, however, are immune from this fatal attraction. Such are the chaffinches, or 'bachelor' finches, as their Latin name implies, referring to their habit in winter of collecting in flocks of different sexes. These fly past unconcerned, while the poor fieldfares are paying heavy toll at the light.

One feature of bird-life here is the lack of song when so many cultured voices are resting in the neighbourhood. Even from a blackbird supposed to breed on the island only an occasional chuckle is heard. The majority are usually too busy feeding to utter more than a call to their fellows. The swift darts black and silently about the cliffs without a scream; the skylarks' attention is too much divided between grubs and merlins, for which latter they show a hearty terror, to favour the lighthouse with a song. The island seems to afford abundant food for birds of many kinds; it is retired from the haunts of man, and was uninhabited between the times when the last small, dark Highlander, whose dwelling may still be seen there, died out and Mr Begg and the lighthouse came to stay. These may be reasons not only for the course the birds take, but for their dalliance, for birds must feed on their long journey, and feeding-places in the routes of the feathered voyager are adhered to from generation to generation, till the practice of holding to such routes becomes an inherited custom.

THE OUTLAWS OF SILVER STAR.

AN EPISODE OF ARIZONA.

DEEP-VEIN mining has ever been regarded with favour by the people of Great Britain; nor is it astonishing that it should be so when we reflect on the variety of useful minerals found on our island. We have copper, tin, iron, and lead, to say nothing of the vast areas of our coal-deposits; so that we might suppose the Englishman would take as naturally to mining as he would to tilling the soil. Again, we derive a pleasure in overcoming the many difficulties presented by the mining industry, and it is with feelings as though for a victory over the forces of nature that the miner regards the bright ingot, the constituent atoms of which were formed ages ago in their crystalline matrix deep in the crust of the earth.

Deep mining demands the highest degree of engineering skill for drainage and ventilation of the workings, as well as the powerful machinery required for hoisting ores to the surface, in the manufacture of which we have excelled all nations. Even the early Briton seems to have taken kindly to this industry, for we are told that Cornish miners supplied the Phœnicians with tin. Lastly, it appeals to us as a great commercial people when we are assured that from no other business need we expect such splendid returns for the capital invested as from mining.

Of the precious metals we had none, so we were compelled to look abroad for our gold and silver. In the first half of the nineteenth century the field was restricted pretty much to Mexico and Central and South America; nowadays, leaving out Europe, it has been extended over nearly a quarter of the earth's surface, of which vast area California, Australia, South Africa, British Columbia, and Alaska are best known for gold, and Nevada, Idaho, and Arizona for silver.

In the early fifties Californians commenced to open up nearly a hundred claims on the famous auriferous belt known as the 'mother' lode, which had been traced for over ninety miles; the rock was extremely rich, and the veins pronounced by mining engineers to be true fissures. British capitalists secured many of these mines at a reasonable figure; some of them, such as the Uncle Sam, Eureka, and the Sierra Buttes, paid big dividends for over twenty years. The first-named had about seventeen million dollars to its credit. Sam James was manager. These properties were generally held by the actual purchasers as *bonâ-fide* investments, not for Stock Exchange speculation.

When we turn from the legitimate gold-mining of California to gambling in the 'wild-cat' silver shares of Nevada, Idaho, and Arizona, the retrospect is gloomy indeed. Owing to the enormous dividends paid by some claims on the Comstock, a craze for silver-mines set in, and 'Baron' Grant (of Emma mine fame) and a few other promoters flooded London with worthless shares. Some idea may be formed of the amount of money lost by the public when we learn that for about twenty-five years we had only succeeded in securing one paying property, the Richmond, in Eureka, Nevada.

Some forty years ago several articles appeared in the San Francisco papers on Arizona, describing its beautiful climate and rich agricultural valleys, boundless mountain-range for stock, and its silver and copper mines. Much of this glowing eulogy was not the least bit overdrawn, but founded on actual fact. In the early stages of asthma or consumption the patient is restored to perfect health after a six months' sojourn in the light, dry atmosphere of the territory; even the most hopeless cases are materially benefited. Thousands of cattle are driven in annually, and pick up wonderfully on the white sage and bunch-grass of the mountains; and the archives of Madrid and the City of Mexico show that from no part of the Spanish dominions in the sixteenth and seventeenth centuries was the output of silver as great as that from Arizona. The great copper-mines of Clifton and Bisbee had not then been discovered.

Many strange old legends handed down for four centuries throw a halo of romance round the early history of these Arizona mines, into which the supernatural largely enters; and this will not be surprising when we consider how credulous and superstitious the half-breed prospectors were, who, when successful, generally told of the bright star or apparition of the patron saint that guided them to the hidden treasure. One, which is fairly well authenticated, may be told. The Bishop of Tucson —the oldest city in the United States, an honour also claimed by St Augustine, Florida—visiting a monastery in his diocese, noticed that the dinner-table was disfigured by a large wooden salt-cellar, and remarked to the prior that, as his monks were working some rich silver-mines, he might provide a better one. The prior apologised, and assured his superior that at dinner on the following day he would see one more worthy of him. The monks were notified, and they and all their peons went to work prospecting the various levels for a lump of native silver out of which a small salt-cellar might be fashioned. To their great joy, one of the peons found a great mass of beautifully crystallised native silver weighing forty-five pounds. A slight depression on the top held a cupful of salt, and this was placed on the dinner-table. When the bishop's attention was called to it he was amazed, and insisted on renaming the mine El Salero (The Salt-

Cellar), which it bears to the present day. The nugget is preserved at the Geological Museum in the City of Mexico.

In the south-eastern corner of the territory, running down to the Mexican frontier, the Silver Star district had been organised. It covered a large area of mountain and deep cañon, some of the peaks of the Pinal range rising to a height of eight thousand feet above sea-level. The place was remote from civilisation, practically cut off from the more settled parts of the country by a spur of the great mountain-chain; it was a no-man's land, and bore a very bad reputation. In the early sixties there were about three hundred men in the place, and scarcely one who was not 'wanted' by the sheriff of some county or another either for murder or stage-robbery. They were a mixed lot of scoundrels so far as nationality went—half-breed Indians, Mexicans, and a few representatives from nearly every country in Europe; these, with about a score of Americans, made up as choice a lot of criminals as could have been found in any section of similar area in the world. There was a small general store in the place, kept by a Mexican who negotiated the sale of stolen horses and cattle for his customers across the line in Sonora; and this, with three or four whisky-shops, formed the 'business' portion of the camp. For about three months in the year, after the snow had melted in the mountains, there was sufficient water running in the creeks to enable these men to turn out and wash the gravels, which in some of the cañons were extremely rich, and this—probably the only honest work they had ever done—enabled them to lay in a stock of provisions for winter as well as money for whisky and poker.

In all communities, whether large or small, we will ever find some ambitious member who pushes his way to the front; and so among the bad men thrown together in this remote corner of Arizona one Matt O'Donnell had long been looked on as leader. Naturally, it might be supposed that such a position could only have been attained among these outlaws by a display of reckless courage in forays on the highway or among the cattlemen of the great *ranchos;* but in such a surmise we should have been utterly mistaken. The outlaws looked up to the 'Irish lawyer,' as they called him, simply on account of the wonderful cunning he displayed in putting up all the jobs they were to carry out. He was the brain of the community, and under more favourable conditions might have been a great strategist or tactician planning a campaign for an army. In the sixties Fenianism was rampant among the Irish in America. From New York to San Francisco nearly every state had a 'head-centre' for the collection of money for the 'cause,' building a few *Alabamas* to prey on England's commerce, &c. O'Donnell was then in Idaho, a new territory, and thought, like the other patriots, he might as well do a little collecting, so he drew up his own commission, which was lithographed for him by a friendly printer. The next step was to rent a small office; and when the commission, with all necessary signatures, was suspended over the mantelpiece, Deputy Head-Centre O'Donnell was prepared to receive subscriptions. He had hundreds of circulars distributed among the various little mining-camps throughout the territory, and inserted short advertisements in all the Idaho newspapers. The patriotic fund commenced to flow in from all quarters, and for six months those were 'bonanza' days for O'Donnell, when the industry was suddenly knocked out by the arrival in Boise City of a duly appointed Irish deputy from New York. The new official was astounded, on looking over the local paper, to find that there was another Richmond in the field, and immediately called on the editor of the *Statesman* to denounce O'Donnell as an impostor. It was lucky for the latter that he did so. 'Captain' Murphy, having been admitted to the great man's sanctum, produced excellent letters of recommendation from the leaders of the brotherhood in New York and Boston, which convinced the editor as to his *bonâ-fides*, and he pledged himself to expose O'Donnell in next day's issue of the paper. Murphy was a typical New York Irishman; he had served with a volunteer regiment raised in that city during the Civil War, and was full of fight. On leaving the office he announced his intention of paying a visit to O'Donnell's headquarters, casually remarking that his bowie-knife was a beautiful tool, and his 'gun' a ·44 calibre; with their assistance he hoped to be able to keep up his end of any little discussion he might have with the rival deputy. It had been very dull in Boise City for months, and it really seemed a pity to spoil a good fight, but that 's what happened. O'Donnell's friend, the man who printed his circulars and commission, was employed at the *Statesman* office, and overheard the conversation between his chief and Captain Murphy, so he quietly started out to warn O'Donnell of the approaching danger. Matt was informed of the true state of affairs; he was told of all that had passed in the editorial room, and saw at a glance that nothing but instant flight could save him from the vengeance of his many dupes in the territory. As a matter of fact, he was not quite unprepared for the blow, which he knew might fall at any moment, and on the off-chance of being able to make a run for his life he had purchased a fine saddle-horse about a month before, which he kept at a stable in Boise City. He had fastened a small valise containing a change of clothing and some provisions behind the saddle, and then with the dollars out of which he had swindled his countrymen in his pocket, outlaw and Ishmaelite as he was, he rode off, keeping to the foothills, and resting by night at the camps of sheep or cattle herders, until, three months afterwards, he rode into Silver Star, Arizona.

It required but a short time for such a crafty rascal to ingratiate himself with the lawless men

among whom he had cast his lot. He told a romantic story of how he had fled from Montana, after shooting one of the leaders of the vigilance committee in a dispute over some mining ground; and this yarn, which was received without question, made him a hero at once. The outlaws—who were given to boasting of their exploits, especially when in their cups, and O'Donnell was liberal in supplying the whisky—had soon put him in possession of a mass of criminal records which might become useful to an informer. For some of these men large rewards had been offered by the United States Government for robbing the mails, by the governors of various western states, Wells Fargo's Express Company, and some mining concerns whose bullion had been captured. O'Donnell made careful memoranda of murders and robberies, determined, if no better scheme for making a big raise could be devised, to get away from Silver Star, and from some safe retreat open up communication with the authorities, and secure the arrest of those on whose head the highest rewards had been set.

About a year prior to the time when we get our first glimpse of Silver Star, a young fellow named Armstrong had sought sanctuary there. He was a native of Boston, a well-educated, sharp New Englander, who had held a good position in Virginia City as secretary to one of the big Comstock mining companies. Unfortunately he was tempted to gamble on the Stock Exchange, and in order to meet his losses embezzled a large sum of money, thinking that his luck would soon turn and he could repay it. It was the sad story of many trusted employés in that town whose careers had been blasted and whose days had ended in the state prison. Armstrong was thoroughly familiar with all the necessary papers, maps, reports, and records required by the concessionaire who wished to place any mining property before New York or London capitalists, so he persuaded a few of his new associates who had been miners before they became highwaymen to relocate and legally record in Tucson some half-dozen of the best of the old abandoned Spanish mines, and when this was done, and the mines cleared of débris so that they might be examined, he started from Tucson by stage to Denver, whence he could reach New York by rail. In about three months he returned with a mining engineer from London, who had been entrusted with full powers to treat for the property. After careful examination, this gentleman informed the vendors that his principals would be willing to form a company to open up the mines, and give them a certain proportion of shares for the claims; furthermore, it would be necessary to levy an assessment of at least half-a-dollar per share in order to raise fifty thousand dollars working capital for machinery, tools, &c.; but he would not sanction the outlay of a dollar for the purchase of the property. O'Donnell, whose name was down as one of the locators, had quietly bided his time, awaiting the ultimatum of the engineer which would determine whether he would receive a round sum for his mining interest or not. When he found his hopes in that quarter blasted his resolution was quickly taken; he would quietly ride away the following night to the military encampment near Tucson, place himself under the protection of the commanding officer, and furnish information which would deliver up to the gallows some half-dozen men who had sheltered him on his arrival in Silver Star. On the following day, after seeing that his horse was well shod, he told some of his associates that he thought of taking a prospecting trip up towards Inyo in the Pannamint Mountains, California. They endeavoured to dissuade him, telling him of the fearful dangers to be encountered in attempting to cross the desert in summer. Even as these lines are written we read in the daily papers of the bleached skeletons of nearly a hundred unfortunate prospectors being found in this dreadful waste, 'their little bags of gold-dust being thrown away, and their bones picked clean by the buzzards.'

O'Donnell lived in an isolated little cabin about a mile away from the cluster of buildings forming the settlement; and in the middle of the night, when all was quiet, he saddled his horse, and, taking a circuitous route over well-beaten trails, started off on a seventy-five mile ride to the cantonments. The day after his arrival, having got rid of travel stains and rendered himself presentable, he sought an interview with the officer in command of the troops. Colonel Henderson, a stern old martinet who had had many years' experience in Indian warfare, heard him patiently to the end; he was accustomed to the falsehood and treachery of Indian and Mexican prisoners when under examination, and looked with loathing and suspicion on this white man who came to betray his companions for the sake of the rewards. He thought the fellow might have been more or less implicated himself in some of the crimes with whose details he was so familiar, so to ensure his safe keeping ordered him to be closely confined in the guard-room.

The colonel was startled to find the name of Ramon Vasquez among those denounced by O'Donnell. The man had long been a terror to the people in the southern counties of California. Some three years previously, when the Fifth Cavalry was stationed at Los Angeles, Vasquez had shot the pay-sergeant through his office window one night, and escaped with a bag of a thousand silver dollars. His trail towards the Arizona line had been followed for several days, until lost in the desert, and the culprit disappeared as though the earth had swallowed him. The colonel communicated at once with the general in command of the Pacific Coast Division and with the Governor of California, and was instructed to take a strong force of cavalry into Silver Star, and arrest, if possible, all the outlaws, but to allow none to escape.

The disappearance of O'Donnell from the district had caused much uneasiness among the outlaws; they fancied that, regardless of their advice, he had

started across the desert for the Pannamint mines. Not one of them suspected treachery; and Vasquez, who had shared his cabin with O'Donnell on the latter's arrival, announced his intention of following on O'Donnell's trail, with a few volunteers, to bring him back.

Having received his marching orders, Colonel Henderson was not slow in getting a picked body of men together for raiding the outlaws' country; and sixty men with three officers, all veterans hardened in frontier warfare, were speedily on the road for Silver Star. Their captain had been supplied with a rough map of the ground by O'Donnell, which showed a little valley, about a mile from the central cluster of buildings, in which the horses grazed, bunch-grass being plentiful, as it was irrigated by a sparkling, flowing spring; so it was determined to detach ten men to the place to cut the outlaws off from their cattle.

It was nightfall when the command arrived, and the ten troopers had not ridden more than half a mile in advance of the main body when they overtook a small party of the enemy toiling slowly along on broken-down, sore-footed mustangs. Escape was impossible, as the dragoons rode alongside them with revolvers at their heads. 'Hands up' was the command, so they had no choice but to obey. One man alone, riding in advance, made an effort to escape; it was Vasquez, who well knew what his fate would be if captured. He and his companions were on their return after a three days' search in the desert for O'Donnell. Vasquez drove his spurs into the poor animal he rode, and it gave a convulsive plunge forward, when a dragoon in his rear fired and missed. Quick as a flash, the Mexican, turning in his saddle, drew his revolver and dropped the man with a ball through his chest. He made an effort to catch the cavalryman's horse, but it was too late; two troopers were within a few yards of him, and he fell dead on the trail, shot through the head. Assassin and thief as he was, there was yet a redeeming trait in his character: he had undergone terrible hardships and risked his life to save a stranger whom he had sheltered a year previously simply because he knew him to be a fugitive from justice.

The command now arrived on the scene, and the captain, having had all the prisoners secured and left under guard, divided his men into four squads. Three of these were to penetrate the ravines and capture all the occupants of isolated cabins, while he with twenty men would deal with the main portion of the camp. It had been his intention to take the place by surprise, and the soldiers advanced in dead silence, when suddenly the air was filled by the loud neighing and shrieking of the outlaws' horses as only affrighted horses can. The men sent up to the cañon to capture them had no sooner arrived on the ground than the mustangs, scenting strange animals, set up this terrible din, and tried to stampede down the valley, so the men had to use their revolvers or carbines to stop them. The uproar created consternation in the place, and men aroused from sleep came rushing in from every direction, when the troops, coming up at a gallop, rode among them and ordered 'hands up.' The majority, unarmed and only half-clothed, submitted quietly to their wrists being lashed together behind their backs, each soldier carrying on the horn of his saddle a few little coils of rawhide for the purpose.

About the centre of the town stood a large adobe building originally intended as a place of refuge in case of an Apache Indian raid, and some half-dozen men now occupied it as their sleeping-quarters. Being favoured by the darkness, about twenty of the most desperate of the outlaws rushed in here and barricaded the door. They were all well armed with rifles and six-shooters, and each one of them, knowing that he fought with a halter round his neck, was determined never to be taken alive. The walls were thick and fireproof, with loopholes for musketry on all four sides. With such a resolute garrison it was a hard nut for the dragoons to crack. The captain was fairly nonplussed, for he had lost three men by rifle fire, and he had no loose powder with which he could make a bomb to breach the bullet-proof walls. Then a bright idea struck him, but before putting it into execution he determined to give the defenders a last chance for their lives. He took a sheet of paper, and wrote out an offer of capitulation, assuring the men of a fair trial in Tucson; otherwise he would encamp on the ground and starve them into surrender, when he would shoot every man of them for killing his troopers. This was passed through a loophole by one of the prisoners whom he sent in waving a white handkerchief. He gave them five minutes to decide, and was answered by a rifle volley fired in the direction where he held his men under cover, and by yells of defiance from the outlaws.

When the store was raided the captain noticed a large barrel of petroleum. This was brought out, a small hole bored in the head, and a time-fuse was made out of a few strands of old rope well saturated with the oil and secured in the orifice. Two of the prisoners were compelled to roll the cask up against the door of the building, and supplied with matches to touch off their infernal machine before retreating. They did not get many yards away, however; for when the outlaws saw the flickering light from the fuse they fired upon the two poor wretches, who fell riddled by bullets. There was scarcely a minute's suspense for the captain; a spark from the fuse fell in the oil, and a terrific explosion followed, blowing the whole side of the building in, and a flood of blazing petroleum poured over the floor, setting all the woodwork of the interior on fire. Escape was impossible through the sea of flame, and when the burning rafters fell on the charred bodies of the victims the work of destruction was complete. It was more like a scene from Dante's *Inferno* than anything in real life.

The only men who escaped death or capture were those who managed to reach some of the old mines. About twenty of them hid away in the underground workings, and so eluded the troops. Their fate can only be surmised, as when they emerged from concealment they found all their cabins and the central buildings destroyed and their horses shot.

Having given his men and horses a night's rest, the chief gave orders for the return trip to Tucson, which was reached after a four days' march, the prisoners toiling painfully along on foot between two lines of cavalry. On arriving the outlaws were heavily ironed and locked up in the 'calaboose.' It was the biggest criminal 'bag' ever made in the country.

The next day they were all marched into a big hall known as the 'bird-cage,' where, behind heavy iron bars, they awaited identification. Then O'Donnell, note-book in hand and surrounded by prison warders, came in front to pick out his men. For an instant they thought he was a prisoner; but as soon as he had pointed out one of their number, reading aloud his name and criminal record, the truth flashed on them. The scene that ensued baffles description. With yells of rage and obscene maledictions in English and Spanish, they surged heavily against the iron bars, hoping that something would give way under their combined weight; it was as though pandemonium had broken loose, such fearful efforts did they make to fall on their betrayer and rend him. The jailers, hardened as they were by long association with the vilest criminals, turned away with a shudder, and it was found impossible to allow the informer to remain. The prisoners were taken back to their cells, and then day after day he examined them through a spyhole in the iron doors without their being able to see him.

The curtain may now be rung down on the last act of the drama. A young Mexican was to be tried for the murder of a stage-driver near Tucson a few years previously. He was a bright, good-looking fellow, of light complexion, for his mother was pure Spanish. His twin-brother, a saddler in the town, had been informed by an attorney that his brother's case was hopeless, as he had taken the driver's gold watch, which, after his escape to Silver Star district, he had sold to O'Donnell, who had delivered it up to the police, and would testify against the prisoner for the sake of the reward offered by Wells Fargo's Express Company. The evidence was too clear to admit of a doubt, and the jury returned a verdict of guilty without leaving their seats. He was sentenced to die.

It was nearly sunset when O'Donnell left the witness-stand, and the ambulance from the cantonments was waiting at the end of a path leading through the courthouse grounds to take him back to quarters. A young man was nervously pacing to and fro beneath a clump of orange-trees about fifty yards from the building. From time to time he turned an anxious look towards a side door which led to the witness's room. There was a fine saddle-horse, whose bridle was held by an Indian boy, standing close to the path. At length the door was opened, and O'Donnell appeared at the head of a short flight of steps. The young man turned his back, and, stepping up to the horse, seemed to be adjusting the saddle. The witness came along quickly, and as he passed the horse the brother of the condemned man in one stride was behind him. His arm was uplifted, and something glittered for an instant in his hand as it caught the rays of the setting sun; then the hand was brought down with full force, striking O'Donnell between the shoulders, and he fell prone to the earth, the life-blood gushing from the terrible knife-thrust in the back. The avenger swung lightly into the saddle, and, waving the dripping weapon in response to the *vivas* from a few Mexicans who were lounging around, started south at a gallop for the Sonora frontier.

IN TOWN.

Oh, the honeyed breath of heather! Oh, the scent of gorse in bloom
On the green and sunny uplands by the sea!
The soft wind bears their fragrance through the city's heat and gloom,
And my heart—my heart—is aching to be free.

I thought I loved St Paul's, with its shining cross and dome,
And the bells that send their music far and wide;
But to-day I want to worship in the little church at home,
Where one ever hears the thunder of the tide.

How I long to wade knee-deep in the cool and pleasant grass
When the happy lark soars up to greet the day,
And the humble daisies curtsy as caressing breezes pass
O'er the fields about the old home far away!

I wonder—oh! I wonder—if the rose still climbs the thatch?
Are the window-ledges gay with flowering musk?
Does my mother ever listen, with her hand upon the latch,
For a footstep coming homeward in the dusk?

If I might but say good-bye to the clamour and the din!
If some bird would lend me wings but for an hour,
Just to reach that quaint, low doorway where the sunlight filters in
Through a screen of yellow jasmine thick with flower!

Oh, the purple of the heather! Oh, the gold of gorse in bloom
On the bright and breezy uplands by the sea!
Kind memory paints their picture in this close and narrow room,
And to think—*to think*—how far they are from me!

MEMORIES OF HALF A CENTURY.

By R. C. Lehmann, M.P.

PART XIV.—*concluded.*

BETWEEN the date of the last letter and that which follows my father had crossed and recrossed the Atlantic.

[F. Lehmann to Mrs F. Lehmann.]

'Wormley's Hotel,
307 1st Street, Washington,
Sunday, 5th April 1863.

'I wrote you a long letter last Sunday, and a few lines on Wednesday the 31st ult., and both epistles went by the same steamer. The improvement in the aspect of my operation has continued at a rapid rate, and it only requires a slight lift over what engineers call the "dead point" to make it a great success. I tell you of it because when I am so much alone as at present, when the idea of the dear ones I have left is ever present, when the flesh-pots of Egypt rise up in sad remembrance against the unsavoury meals which fate sets before me, and when howling winter blasts and deep snow conjure up the balmy air and greensward of dear Woodlands, I naturally feel that all I have sacrificed in leaving you ought to bear compensating fruit, and that nothing but success in my enterprise could make me amends, while failure or losses, if brought about by my journey across the Atlantic, would be doubly cruel. Anyhow, I shall have the great satisfaction of having done my duty and made my utmost endeavours according to the lights within me, and that alone is a great comfort.

'On Wednesday I dined at Mr Hewitt's and his father-in-law's, Peter Cooper (the founder of the Cooper Institute, a kind of free library and South Kensington Museum in one, but of the mildest kind), with General McClellan. The General is a small, quiet, unassuming man, without the faintest outward attributes of a hero. A poor, dull face, with a small forehead and lack-lustre eyes. If he ever saves this republic, physiognomy and phrenology are not worth a red cent. On Thursday morning I left New York, and arrived here about ten o'clock at night. This hotel or boarding-house is principally patronised by U.S. Senators during Congress, and by respectable people who want to be quiet and hate the rush and gilt of Willard's. Consequently Wormley's was hard to find, and when found at last had gone to bed. Thomas, an old negro factotum, received us half-asleep; and to my expression of hope that although the house seemed empty they would come up to the good reputation I had heard of them, merely answered, "Never you fear, mas'r; we'll treat you *nicely*." And so they are doing, all things considered. I have a nice, quiet sitting-room and ditto bedroom. The food is fair, the guests only two or three, and the attendance black and kindly. With me, as my secretary and assistant, is one of our New York clerks, Mr Francis Garlichs, an American from Missouri, born of German parents and speaking German. His handwriting is so beautiful that I think the Secretary of War will find it difficult to decline offers written out by him in something like copperprint.

'This is Easter Sunday, 5th April, and we have a foot of snow in the streets fallen overnight. A furious gale is blowing, and Washington is a howling wilderness. On Friday I sent my letters to Lord Lyons, M. Mercier, and their two secretaries, Mr Clay and M. Treilhard. Lord Lyons at once sent me an invitation to dinner last night. He received me very kindly, and said, "You have brought me a letter from my dear friend Browning. You must tell me all about him, for we spent such happy days together in Rome," &c., &c. He is tall, looks forty-five to fifty, and is the very personification of good-breeding. Undemonstrative, perhaps cold, but suave, polished, and easy. He told me that a good many of the Legation had gone to Baltimore for the Sunday. There was only one stranger, whose name I did not catch, and two attachés, or rather one, and the secretary, Mr Clay. The dinner was very fair, the attendance admirable, and the whole thing was over in less than an

 [*All Rights Reserved.*]

hour. Scarcely any wine was taken after dinner; and, there being no ladies, Lord L. gave the signal to rise. Having been told that he says very little, I was agreeably surprised to find him pleasantly communicative. He seems to believe that in the course of three or four years, if the conscription is not resisted, the North will get a good army, immediately under the control of the Washington authorities and detached from local ties; that they will then get some good Generals, and will finally overcome all organised resistance of the South. We had a long chat, and once he said, "My position here is one of constant worry and irritation, and upon my word I believe I am the only impartial Englishman left, unless, begging your pardon, you should happen to be the other one."

'Fearing that I might tire him and outstay my welcome, I left early. This morning he kindly sent me a note:

'"MY DEAR SIR,—If you have nothing more attractive in prospect than a dinner at your hotel, will you give me the pleasure of your company at seven o'clock this evening?—Yours faithfully,

"LYONS."

'This is very polite, but I had to decline it, as I am to dine to-day with M. Mercier, the French Minister, who called upon me yesterday afternoon, and sat for an hour talking politics by the yard and nonsense by the mile. He explained to me that during the entire late mediation scheme he had been on the best terms with Seward, and is so now; that Seward had first shown him the text of his message to Congress (which was thought in England to give Mercier the lie direct), and that he had given assent to every line of it. There was at the time an intrigue against Seward to which he (Mercier) would not lend himself, &c., &c. This is only another instance of unruffled peace between the diplomatists while the newspapers cry fire and sword, and the gullible public get frightened into fits. Mercier is satisfied that this war can only be ended by European intervention, and that if England had joined France, and both had said, "Unless you settle your differences by a given time, we recognise the Confederacy and open the ports," the North would have given in at once, "*mais l'Angleterre n'a pas voulu. Elle a peur d'une guerre avec le Nord, mais elle l'aura cette guerre, elle l'aura, qu'elle fasse tout ce qu'elle voudra. J'aime beaucoup l'alliance anglaise, qui est après tout pour la France le seul moyen de garder l'équilibre et la paix en Europe, mais j'avoue que les Anglais sont des amis très difficiles et bien des fois très désagréables. Ce sont eux qui de leur côté apportent les difficultés et les obstacles dans l'alliance*," &c.

'*Monday, 6th April* 1863.

'Here I was interrupted yesterday by a visit from Mr Clay, who stayed over an hour and made himself very agreeable. We reviewed a great number of mutual acquaintances in London, and did a very fair amount of small-talk. He told me that I occupied the room in which Mrs Fanny Kemble-Butler and her daughter had lived some eight months ago, and that they had had "great fun" here. Telling him how agreeably I had been surprised by Lord Lyons's pleasant and communicative ways on Saturday night, he said, "I assure you I was no less surprised than yourself. Indeed, I told his lordship so after you had left, as I have never seen him so open and talkative before. You have undoubtedly touched the secret spring to draw him out." (Hear, hear.)

'I dined with M. Mercier. There were only Madame Mercier and an attaché. He talked for four, and sometimes very well. I had put on a white cravat, as at Lord Lyons's, where I found them all dressed up to their eyes. Mercier was in his shooting-jacket, and on seeing me said, "*Comment, avec une cravate blanche? Mais nous n'aurons qu'un dîner tout à fait sans cérémonie.*" I told him that it seemed *de rigueur* at Lord Lyons's, although there was no party. "*Oh! les Anglais*," he replied, "*je crois que Lord Lyons dînerait en cravate blanche tout seul vis-à-vis de lui même.*" In the evening I asked her to play, and she did play a few of Chopin's Nocturnes, not without a certain taste and a good deal of execution. She is a little like Miss Gabriel *en blonde*, if you can imagine that. There was a Washington banker there, a Mr Riggs, who came after dinner and took me from Mercier over to his house, which is a very gorgeous establishment. I thought he was a bachelor, and was going to give me a drop of whisky and a cigar, when I found myself suddenly in a drawing-room full of his wife and about eight daughters. The surprise was terrific.

'BREVOORT HOUSE, NEW YORK,
Sunday, 12th April '63.

. . . . . .

'Last Sunday in Washington we had a snow-storm, and I was tramping about with my big waterproof overalls. To-day we have *summer*—not spring, but hot *summer*. The transition has upset me, and I am sneezing to knock the walls down. Yesterday we had a great mass meeting in Union Square, called a Sumter Meeting to celebrate the rising of the North after the taking of Sumter by the Confeds. Two years ago yesterday there were six stands, and from each some hoarse patriot was stirring up the people and defying the universe. Tremont, Sigel, and *hoc genus omne* blazed away, but the acoustics of the open air were much against them. While they were talking the Confederates *down* in Union Square, gold went *up* in the city in consequence of news of a repulse at Charleston. Tell papa and who else may care that in my opinion the talk of war between England and America will remain *talk only;* it is not the *interest* of the North to have a war with England. What Europe has taken for granted from the first—*i.e.*, the impossibility of conquering and subjugating the South—has not yet even distantly dawned upon the Northern mind. They are perfectly and almost unanimously convinced of the possibility of success,

and it will take years and years before they will give up trying. No party that advocates anything but war until they shall have recovered every inch of the former Union has the remotest chance of influence or even existence. The ambition to be a mighty nation, equal to or greater than any in Europe, is the idea which holds possession of the Northern mind to the exclusion and disregard of every other. All reverses will be put down to the administration or bad Generals, but nothing will make them give up but utter and hopeless exhaustion. In my opinion the war is only beginning, and will last more years than I dare to think of. This, however, is England's safety, for as a war with England would mean an alliance between the South and England against the North, the latter cannot afford to fight the South *and* England.

'On the other hand, England is so well convinced that the evil of war with the North would immeasurably outweigh any benefit we might derive from opening the Southern ports that I am satisfied England will do all consistent with her honour and dignity to prevent war.

'Hence I believe in endless palaver and angry correspondence between the two countries, but in nothing more. Ernest Clay came on here before me, and left again for Washington yesterday. He was very affable, regretted exceedingly that he had not seen more of me, as they "did not often get such a godsend in Washington," and promised to look us up when he comes to London, &c., &c.'

My father eventually returned home to England firmly convinced of the ultimate victory of the North. I have already recorded how he tried and failed to persuade Charles Dickens of the justice of his views on this point.

THE END.

A PAWN IN THE GAME.

CHAPTER XXXI.—NAPOLEON'S 'GRAIN OF SAND.'

DAYS passed while Jack waited and fretted. The besiegers were now driving mines with furious energy towards the city; one more attack had been hurled against the breach, and had failed. Jack seemed forgotten. One evening, however, he was summoned to General Reynier's tent.

'The Commander-in-Chief,' that officer explained, 'will see you, but there are difficulties in the way of sending you aboard one of the British ships.'

'There ought to be no difficulty. I am not a combatant. I am in your hands as the result of a disaster which entitles me to respect and compassion.'

'But there are complications. The Arabs claim you as their prisoner.'

'And will Frenchmen leave a European and a Christian in the hands of Mohammedan savages?'

'They are not savages. They are our allies. The General must be diplomatic; he cannot afford to offend his allies. He has something to propose to you to-night; and, monsieur,' added Reynier gravely, 'I advise you to fall in with his wishes.'

Jack was strangely puzzled as he walked back to his tent. What could the Commander-in-Chief have to propose to him except his release?

Late that night an orderly summoned Jack to the Commander-in-Chief's tent. Bonaparte was alone, and his face, seen by the light of the flickering lamp, was inscrutable.

'Laurente,' he said, going straight to his purpose, 'you are claimed by the sheikh as his prisoner, and I cannot afford to quarrel with my allies.'

'I did not know the French Commander-in-Chief was so careful of Arab susceptibilities, or that the alliance of Arabs was so necessary to a French army.'

Bonaparte's eyes flashed for a moment; but he went on, 'When we separated in Paris you refused the career I offered you. But you have been flung in my path again. It is fate. The wreck and the Arabs are but its instruments. I will send you in to Acre under a flag of truce, and you can join your countrymen. You can even take these despatches with you,' he said, pointing with a gesture of contempt to a document lying on the table.

Jack began to express his thanks.

But Bonaparte went on, with a raised voice, 'There is one condition. Those fools'—and he jerked his hand angrily in the direction of Acre—'are holding out in hope of relief. I crushed one relieving army at Mount Tabor; now they are expecting another from Rhodes. I have definite and sure intelligence that the scheme is abandoned; the destruction of Abdullah Pasha's army at Mount Tabor has settled that. You must take the news into Acre, and must assure Djezzar, on your honour, of its truth. It will save further waste of blood.'

'Why not send in the news yourself under a flag of truce?'

'They will not believe it; but they will believe it coming from an Englishman, an agent of the Foreign Office.'

'And for that reason I cannot take it. But if I accepted your offer,' Jack added, after a moment's pause, 'what security have you that when I am safely in the lines at Acre I should carry your message? Or, if I carried it, why should I not explain that it was only a trick?'

'I can rely on your word,' said Bonaparte.

'But why should not I lie? Truth and falsehood,

you once told me, are only tools; and a wise man will use either at his convenience.'

'Ah, my poor Laurente, I know you; so I pay you the compliment of trusting you. You have what you call a conscience. It may be stubbornness, it may be honour; but you will keep your word.'

'Perhaps they would believe me in Acre,' said Jack bitterly, 'as I am not French; but the message is a trick, and I shall not carry it.'

Bonaparte looked at him. 'You have learned nothing,' he said, 'and you have missed everything, because you are stupid.'

'At least I have kept my conscience unsoiled.'

'But you pay the price of that luxury in a ragged coat and a ruined career. The Arabs claim you as their property. You will be their slave, and you do not guess how cruel that slavery is. I shall not take you out of their hands except on the terms I named.'

'Then,' said Jack, 'I must remain their slave.'

After the interview with Bonaparte, Jack for a while seemed forgotten. Days of waiting followed, which he might well have found intolerable but for the fierce drama of the siege in progress on every side of him. The fury of conflict at the front ebbed and flowed, but never really ceased. The fighting impulse behind the walls was as fierce as that in front of them, and almost every attack was followed by a counter-attack. The siege lasted sixty days, and when its stern arithmetic was afterwards computed it was found there had been forty attacks and twenty-six sorties, or more than one fierce and general combat for every day of the siege. Jack thus had the opportunity—given to few of his time—of seeing day after day, and at close quarters, how Napoleon's veterans fought.

On May 7 Kléber's division marched in from Mount Tabor. Jack watched the men streaming in, and it seemed to his wondering eyes a mob rather than a division of disciplined troops fresh from a great victory. They came in loose order, with noisy clamour of voices. Their uniforms were ragged and dusty; they were laden with booty. But the men had some at least of the qualities of veterans. Their arms were clean and in perfect order. A touch of pride, not to say boastful swagger, was in their gait, for the wine of victory ran hot in their blood.

Kléber was riding at their head, and his huge stature and lion-like face awoke the shouts of the men from the camp when the swarm of soldiers poured out to meet them.

'*You* can take Acre,' they cried; and certainly to the victors in the great fight at Mount Tabor the task looked simple. The great triangular breach in the stretch of the low gray wall seemed to offer an easy path for daring feet. The tower that flanked it was jagged with shot-wounds. Behind those frail defences were only Turks and British sailors.

In the veins of Kléber's men, like the intoxication of strong wine, was the elation of success, and Jack heard that sound—not often raised in more sober camps—the shout of whole regiments clamouring to be led to the attack. They could do what the brigades of Lannes, of Davoût, of Menou, and of Rimbaud had not done.

Bonaparte was not the captain to waste such a mood in his soldiers. Quickly the word came for the assault. Kléber's men were to be let loose.

They fell swiftly into column; the officers took their places with drawn swords; the grenadiers, with their tall shakos, ran to the front. Almost at a breath the 'mob' became a disciplined force, and in what seemed to Jack's astonished eyes an incredibly brief period of time the attack was launched. He had watched the breach attempted at least half-a-dozen times, and attempted gallantly; but the whip of fire from the ships on either flank and the line of darting musketry flames from above invariably wrecked the assault. The mass of stormers would cling to the lower slopes of the breach. Single figures would break out of it, run upwards to the crest, and shrivel like human chips in the flame of musketry fire. The slope after an hour's conflict would be splashed with blood and thick with the bodies of the fallen dead, but the breach itself would remain unscaled.

This time the attack was weightier and more formidable, and it was driven home with more resolute purpose. The column swept up to the very crown of the breach, unchecked, with one fierce impulse. Jack could see one cluster of stormers after another leap, with muskets lifted high in their hands, down the inner side. 'They win! They win!' went up in shouts from the batteries.

Then a tumult of sound arose inside the walls; there was the sustained and angry crackle of musketry fire; the upward impulse of the column was arrested; there was a struggle on the crest of the breach. Then back—a stream of flying figures, almost as though shot from some great catapult—came the stormers; but where many had leaped down within the walls only few returned. The upward stream had been dense and thick; the returning human current was only a trickle of straggling and flying soldiers.

For many minutes the arrested attack clung to the lower slopes of the breach, while the front seemed constantly to shrivel under the fire from the walls. Kléber stood midway, his huge figure, his fierce gestures, visible from the batteries; then past him, and finally sweeping him away with it, came the backward swirl of the defeated column, a tumult of breathless, furious, defeated men. A dozen times over Jack saw some officer with waving sword lead the men immediately about him a few steps up the breach, but steadily, like the reflux of a wave, the group swung back again. All the madness, the valour, the horror of a stormed breach was visible.

Within easy sight of the conflict was a little rising ground called the Mound of Cœur de Lion;

and on its summit a greater soldier than Richard the Lion-hearted stood and watched the fight. Bonaparte, with folded arms and chin on breast, stared at the scene from that spot, a group of officers behind him. To the left the sea was thick with white sails. It was the Turkish fleet from Rhodes at last in sight; but its sails hung idly, for no breath of wind was stirring. Boats full of soldiers were pulling fast to land. It was a race betwixt the coming boats and the furious stormers on the breach, and the boats won!

Jack was near enough to the group on the mound to see their faces. The little cluster of orderlies and aides behind Bonaparte watched the struggle with fierce gesticulations and loud clamour of passionate speech; but Bonaparte himself stared at the scene in silence, with frowning brow and unmoved face. When the fight at the breach was abandoned, and Kléber's men came streaming back into the camp, Jack saw Bonaparte riding through them. His face was fixed and expressionless. He seemed to look with unseeing eyes at the wild spectacle about him, the broken groups of soldiers—breathless, exhausted, many of them wounded. It was plain that quite another scene was present to his mind. It was a vision of shattered dreams. 'A grain of sand,' he said bitterly at St Helena years afterwards, 'undid all my projects.' And Acre was the grain of desert sand that had stayed the iron car of the great captain. That low wall, rent with more than one breach, had somehow proved a barrier which all his genius and the utmost valour of his soldiers could not cross; and, as Bonaparte rode amongst his defeated soldiers, what rose before his vision was a landscape of wrecked hopes.

After the failure of Kléber's men came a pause of mere exhaustion in the siege. The guns in the batteries spat little jets of flame at the walls, but for three days there was no fresh attack. On the fourth was a new assault of a languid sort; but Bonaparte had shot his last bolt. All through the night which followed Jack heard the roll of wheels, the tramp of feet, go past his tent. Looking out, he saw convoys of wounded, of guns, and stores go streaming through the darkness. There was the same spectacle all the next day. The siege was abandoned, and Jack realised that he had witnessed the first great failure of his old comrade.

Meanwhile, what was to be his own fate? His parole bound him, or he would have attempted to reach Acre. It seemed as if he were forgotten. But at midnight, while the stream of stores and guns was still flowing past his tent, an orderly roused him with the news that Lieutenant Ricord, from General Reynier, required his presence.

The scowl on the lieutenant's brow was darker than ever, the gloom of his long, stern face deeper; his arm was carried in a sling. He had plainly been wounded in the last attack. The old sheikh was by his side, a couple of Arabs behind him.

Lieutenant Ricord curtly explained that the Arabs claimed him as their prisoner, and he was to be surrendered to them. Jack expostulated, but the only answer was the brief phrase, 'By General Reynier's orders.' Jack demanded to see Bonaparte himself, and was sternly told that the Commander-in-Chief had better work to do that night.

'Does he know that I am to be given back like a slave to these Arabs?'

Lieutenant Ricord only shrugged his shoulders in reply. 'Do you withdraw your parole?' he asked.

'Yes,' said Jack fiercely.

The French officer spoke a few words to one of the Arabs, and then turned away without a salute; and in the light of the torches flaming near Jack saw the cruel smile on his grim features. At that moment he felt some one pluck his arm. It was Corporal Lebrun, who without a word thrust a little parcel into his hands, and then disappeared in the darkness with a gesture of farewell. When, later, Jack opened that parcel he found it contained a pistol, with powder-flask and bullets, a useful but somewhat ominous gift.

The old sheikh, having first tied Jack's hands behind his back and fastened his wrists by a rope to the saddle of one of his followers, rode off through the darkness, his prisoner running with stumbling feet beside the camels. A trot of a couple of miles brought them to the camp, and, with his hands still fastened behind his back, Jack sat on the ground till daybreak.

Already he had noted that the Arabs were curiously cheerful, and he guessed it was because they had got their money and their prisoner too. Had Reynier, vexed that his plan for sending the Englishman into Acre with a misleading message had failed, thrust him back into the hands of the Arabs without Bonaparte's knowledge or consent? Jack hoped this was the case, but he never knew.

The next morning the Arabs struck camp and started in what Jack, judging by the sun, saw was a south-eastern course. Drawing a mental plan of the surrounding country as best he could, he guessed their track would strike the head of the Gulf of Suez. He knew that they belonged to Upper Egypt, where all the Beys—as General Baird found afterwards—were in the French interest. The mingled attractions of war and trade had brought this particular band to the Mediterranean coast; and they would, no doubt, have clung to the French as long as they were successful. But they had seen their failure in front of Acre, and, laden with booty, they were now on their way back to their native oasis.

As he realised the vast stretch of country—huge spaces of it mere waterless desert—they must cross, Jack's heart almost sank. But his courage was high. He vowed he would escape at any risk. He looked round on the figures about him. They were true Bedouins, children of the desert, lean, hardy, tireless; but in knowledge, in daring, in energy, he felt that he was their superior. A flame of scorn

kindled in his blood at the thought of being a slave to such a group. Corporal Lebrun's pistol was safely hidden in his dress, and he resolved he would be free or die.

All day long his brain was busy with plans. His chance, he decided, would come in the darkness of the night; but for the first few days the Arabs, passing through a hostile country, were sleeplessly alert, and Jack found he must wait with what patience he could till they were near the head of the Gulf of Suez and on the very fringe of the desert. Then the guard would be less vigilant, and he would make a dash for the sea-coast.

At night as he lay on the sand his thoughts flew across the sea to London. He could see, as if painted on the screen of the darkness, his aunt's kindly features, his uncle's square and lawyer-like brow. But outlasting these was the face of Denise inexpressibly vivid and sweet. What must they think of his disappearance? Did they mourn for him as dead?

Meanwhile, in London, the weeks went by after the *Sylph* had sailed, and in those days of slow communication no anxiety was felt at the absence of any news from the ship. But the weeks grew into months, and still no letters came. Wonder at the absence of any intelligence sharpened into anxiety, an anxiety that quickly grew almost too deep for words. Jack seemed to be swallowed up in some gulf of silence. Robert Lawrence took it all with a philosophy that distressed Denise and made his wife sharp-tongued with vexation. He was scolded into interviewing the officials both of the Admiralty and of the Foreign Office. Instructions were sent to the squadron off the coast of Syria to make special inquiries after the *Sylph*, but all in vain. The ill-fated ship had vanished.

Denise was silent; but, as her aunt complained to her husband, her eyes seemed like interrogation points. She wore the face of one who was always listening for a message that never came.

'She is fretting her heart out,' said Mrs Lawrence. 'She is persuading herself that for whatever disaster has befallen her lover she is to blame. She sent him to the East.' And this was true. Denise was consumed by a grief through which ran the bitterness of remorse.

'Aunt,' she said one day, 'I cannot bear it. I sent him! I sent him! And I feel that if anything has happened to him his blood lies on my conscience. And, oh, I loved him! I know now how much I loved him! And I never told him, but sent him away to some dreadful fate. Why did I set my girl's judgment against his?'

'Nonsense, child,' cried her aunt. 'You did right; and the consequences of doing what is right never broke anybody's heart yet. And, my dear,' she added softly, 'no love is safe against loss.'

'Ah!' said Denise, 'if God had taken him I should have mourned for him, and have gone to my grave unwedded for him. But I should not feel as I feel now that I had sent him to his grave.'

She recalled every look in his face, every tone in his voice, and realised how love for him was woven in every fibre of her nature.

Robert Lawrence was still hopeful. 'Jack,' he said, 'has as many lives as a cat. Paris could not kill him, nor M. Duclos. He survived the September horrors. He is a fellow of endless resource, and will float where ninety-nine men out of every hundred would drown. Behind the mask of his quiet face is as keen a wit as you will find in a human head anywhere. He will turn up again, little one; and if we let you fret your bright eyes dim with idle fears he will never forgive us.'

Mrs Lawrence did her best to persuade Denise to give up her work and come and live with them; but Denise shook her head.

'Work is a medicine, and while I am busy at it I almost forget;' and the smile with which she said this seemed to Mrs Lawrence sadder than any tears could be. But Denise went on, 'I want a new kind of work. The way to make one's own trouble light is to try to lighten the troubles of others. I made that discovery in the Abbaye. I used to forget for a while my own fear and distress when I was nursing the sick child of some poor wife whose husband had gone to the guillotine. I often pass dark and filthy courts, and see in them little children hungry, untaught, and half-naked. If uncle will find the money I will visit one of these courts a couple of afternoons every week, and try to help the poor people there.'

Robert Lawrence, when the plan was explained, first vowed that the scheme was quixotic, and that Denise was a fool to risk her health and waste her time in trying to help the poor wretches in the slums. But he ended by putting all the money Denise needed in her hands, and she plunged into this new work. She undertook it at first as a sort of nepenthe for her own tormented thoughts, but she learned by degrees to act on a loftier motive; and her work reacted on her, giving a new strength to her will, a deeper sweetness to her character, a strange light of pitying serenity to her face. Robert Lawrence watched the change in Denise.

'My dear,' he said to his wife one night, 'what is happening to poor Jack nobody can guess, but Denise is being enriched by all this trouble. If the young fellow does come home and marry her he will have nothing less than a human angel for his wife.'

'All good husbands have that happy experience,' said Mrs Lawrence, 'though they are not always conscious of it.'

(To be continued.)

VAPOUR PRESERVATION OF FOOD.

THE NEW SCIENTIFIC PROCESS AND ITS POSSIBILITIES.

By FREDERICK A. TALBOT.

TO the inhabitants of this country, owing to the extent of our dependence upon foreign sources for the supply of our food-stuffs, especially those of a perishable nature, the transportation and preservation thereof is of vital importance. Meat in varied forms, fish, eggs, and other similar comestibles are now brought to these shores from the most remote quarters of the globe, in a frozen condition; and although the science of refrigeration has been brought to a high standard of perfection, it yet possesses many inherent disadvantages. The article of food has either to be frozen or its temperature reduced to a point approaching zero, and retained in this condition until it reaches its destination. By this means decomposition is arrested; but directly it is placed in the normal atmosphere and commences to thaw the refrigerative effects disappear, and putrefaction at once sets in. It will thus be realised that extreme care must be observed in maintaining the low temperature within the refrigerating chambers during transit, a slight rise in temperature due to the failure of the freezing apparatus or any other cause being sufficient to spoil the cargo. Though fortunately such accidents are not of frequent occurrence, the liability of mechanical ingenuity, like human flesh, to err is ever-existent, and in the event of such a development considerable damage is wrought. Moreover, the process of freezing exercises a destructive effect upon the nutritious qualities and tastes of the articles so treated.

Under these circumstances, for some years past scientific investigation has been directed towards the evolution of a simpler, cheaper, and more effective process for preserving perishable foods for an indefinite period, wherein the disadvantages incidental to refrigeration have been successfully overcome. The greatest success in this direction has been achieved by M. Isidore Hislaire, a scientific chemist of Brussels, and his invention is the outcome of several years' patient investigation. Though he suffered many disappointments in the course of his researches, success at last attended his efforts some two or three years ago, since which time he has devoted his energies to the perfection of his process, so that it may be brought within the reach of one and all, to the humble housewife as readily as to the extensive exporter, to the small kitchen as easily as to the largest vessel afloat.

The process is simplicity itself. The comestible is inserted in an airtight chamber, into which is passed the vapour from a secretly prepared pastille, and the food is immersed in this atmosphere for a certain period. The surface of the edible becomes coated with an invisible film or sheathing, permeating to a slight depth from the surface, of the gas which effectually preserves the article from the oxidisation of the air, and thus arrests putrefaction. On being withdrawn from the chamber the article of food can be exposed to the ordinary atmosphere for almost an indefinite period without any apprehensions concerning its wholesomeness and purity, as the gas-deposit upon the surface does not evaporate until brought into contact with heat. When the edible is placed in the oven or boiled upon the fire the gas is liberated, leaving the article precisely in the same condition as it was before treatment. No traces of the vapour can be detected either by the palate or smell.

The tablets themselves are composed of some ten ingredients. They are white in colour, about the size of a sixpence, and approximately four times as thick. When brought into contact with a temperature of about one hundred and seventy degrees Fahrenheit the pastille dissolves in the form of a transparent vapour, and leaves only the slightest perceptible residue behind. If submitted to an excessive degree of heat the lozenge simply burns or chars away in almost the same manner as sulphur when ignited, without emitting any gas, so that it is only necessary in utilising the system to ascertain that an excessive heat is not employed. The chemical composition of the vapour generated may be best described as the purest form of carbon. Its presence can be easily detected by its peculiarly pungent smell, and when it is inhaled its effect is to produce watering of the eyes and a severe headache. Consequently the possibility of accidental asphyxiation is rendered very remote owing to the ease with which it can be identified.

The process is fundamentally the same whether used in conjunction with the small airtight chamber adaptable to the cottage or the large chamber designed for service on board ship or in stores and capable of accommodating several hundredweight of comestibles at one and the same time. In the first case the plant comprises a small wooden or metal cupboard fitted with an airtight door, and not unlike the ordinary gas cooking-stove in general appearance. At one side in the bottom is a small orifice communicating with a smaller receptacle in which the pastilles are inserted. Beneath this is placed a small spirit-lamp, the heat from which causes the pastille to evaporate, the vapour passing into the cupboard. As the shelves are perforated or made in skeleton form, the gas can disperse equally all over the interior, so that the latter becomes equally charged with the carbon sterilising atmosphere. The articles of food are left within this receptacle for about a quarter of an hour, then withdrawn and

deposited in the ordinary way in the larder or some other suitable accommodation.

For treating food-stuffs in bulk the apparatus is made of steel, and at the side is placed a powerful small rotary fan for withdrawing the air from the interior of the chamber. The pastilles are placed in a small vessel attached to one external surface of the appliance, from which the vapour under the evaporating influence of the heat applied passes into the chamber. When the requisite quantity of gas has been generated the fan is given a few turns, which serves to distribute the vapour well throughout the chamber, so that the articles at the bottom receive as equal a supply as those at the top. After exposure to the carbon for about thirty minutes the articles are withdrawn and stored wherever desired in the outer atmosphere. It will be observed that in order to preserve the comestibles they are not permanently retained in the sterilising atmosphere, but are only submitted to its influence for a certain prescribed period, which varies according to the dimensions and capacity of the appliance used.

To the householder the process affords a complete solution of the problem of keeping perishable foods such as butter, meat, poultry, fish, eggs, and milk for an indefinite period. In summer this is a particularly acute difficulty. With this apparatus, however, no fears regarding such comestibles souring, fermenting, or decomposing need be entertained. After being sterilised they will retain their purity and full flavour for weeks without the slightest deterioration. Moreover, the carbon is an excellent germicide, and meat so treated is immune from the ravages of flies and insects. The refrigerator, or 'ice-box,' as it is more familiarly called, has now become an indispensable part of the culinary equipment of many homes; but the difficulties and expense entailed in its use, such as the purchase of ice, are well known. By the Hislaire system preservation can be effected much more easily and economically than refrigeration, the cost averaging about one penny every time the sterilising apparatus is used.

At first sight it may appear that, the food being impregnated with carbon fumes, traces of such treatment would be recognised when it was eaten. Such, however, is not the case. As the heat generated by the lamp evaporates the pastille, so does that of the oven or boiling water cause the liberation of the fumes forming the protective covering to the food. Consequently, when cooked, the meat, fruit, or vegetable tastes exactly the same as if perfectly fresh; while, in regard to meat and poultry especially, all the improvements secured from prolonged hanging are secured without the slightest trace of deterioration. Moreover, neither the colour nor the appearance is in any way changed.

To those engaged in the export trade of perishable foods the process promises to effect a revolution. It is simpler and easier to carry out than refrigeration, while it is far more effective; also, it is considerably cheaper, the cost averaging only a few shillings per ton. It also enables the reprehensible practice of treating meat with boracic and salicylic acids or other preserving chemicals to be dispensed with. That the process has great possibilities in this connection is evident from the fact that it is already in operation by one or two importing firms in this country, while experiments upon a more elaborate scale are in contemplation in regard to the South American and Australasian oversea meat traffic.

The process is applicable to any system of preservation where refrigeration is at present in vogue. To the bacon and ham importing industry, for instance, it should be especially advantageous, since considerable difficulty and wastage occur in this trade under the existing system. For example, in connection with the foreign exportation of hog-products, powdered borax has to be extensively resorted to. The hams are plentifully treated with the chemical—a preserving medium which has long been deprecated by medical officers of health, and which is now prohibited in connection with other foods—packed in crates or bales with brine, and then stored on board in the cold room. On reaching their destination the products are dusted, washed with tepid water to remove the effects of the salt and borax as far as possible, and then sent to the retail market. The very process of washing with the tepid water proves the undoing of the ham or bacon. It at once propagates putrefaction, which, though slow, is nevertheless sure, as many a purchaser has found to his cost, decomposition invariably setting in around the bone. Such a procedure from a cursory point of view appears reminiscent of the malpractices revealed in a sensational novel published some time ago, which set up a revulsion of feeling in regard to imported food-stuffs; but yet the industry has reverted to the process as being hitherto the only satisfactory one available—a severe handicap, it is true, but one which is now entirely removed by the pastille process. This was conclusively shown in an interesting test recently. A consignment of bacon received from Ireland was selected by a well-known firm of bacon-curers for the purpose of comparative tests. Four sides were sterilised upon the Hislaire system, while a similar batch of four sides was left untreated. They were then returned to Ireland. In a few days the untreated bacon had so deteriorated as to be unfit for consumption, and had to be destroyed. The sterilised sides, on the other hand, were left exposed to the normal atmosphere for thirty-two days, when two sides were again despatched to London for bacteriological and scientific examination. Investigation revealed the fact that the bacon was perfectly pure and edible, and free from the slightest traces of slime or fermentation. They were then smoked, and ten days later cut up and eaten.

As already mentioned, the carbon vapour produced by the evaporation of the pastilles is a powerful germicide, and elaborate experiments have been carried out to determine the effect of the treatment upon bacteria. They were of a most exacting nature, and every facility was provided favourable to the

propagation of the bacilli most vitally concerned in the process of putrefaction. In every case, however, it was ascertained that fifteen minutes' submission to the carbon vapour completely killed all organisms. In the course of these investigations tests were made with the bacilli causing typhoid-fever and cholera, pneumonia, suppuration, and anthrax. One and all succumbed to the vapour. Such a result is highly gratifying, especially in regard to the anthrax bacillus, the spores of which are extremely resistant and are not readily killed by a 5 per cent. solution of carbolic acid; they were completely killed, however, after fifteen minutes' exposure to the vapour.

Unlike refrigeration, the process exercises no effects upon the digestibility of the food-stuffs treated. This was shown very convincingly with thin slices of the white or albumen of hard-boiled eggs which, after being submitted to the process for fifteen and thirty minutes respectively, were immersed in an artificial gastric juice composed of pepsin and 2 per cent. hydrochloric acid, and maintained at the temperature of the body, together with slices of similar albumen of the same dimensions cut from the same egg to enable comparative results to be made. This showed that sterilisation does not render the food indigestible, since the sterilised and untreated slices were digested in the same length of time.

By means of this process a great deal can be accomplished in ensuring the purity of milk-supply. As is well known, this liquid dietetic is probably the most susceptible to contamination and the growth of harmful organisms. It can, however, be treated as easily as meat or fish. A special type of apparatus is employed, consisting of a cylindrical chamber containing the carbon vapour, with a funnel at the top and a receiver at the bottom. The chamber is first charged with the carbon atmosphere, and then the milk is quickly passed through in the form of a spray, only being in contact with the vapour for the fraction of a second, during which time, however, owing to the magnetic qualities of the milk, sufficient carbon is taken up to render it perfectly sterile. Milk so treated is rendered germ-proof for a prolonged period irrespective of climatic conditions; yet at the same time the proportion of carbon vapour absorbed is so slight—chemical analysis shows about one part of carbon to one hundred thousand parts of milk—as to be tasteless, while at the same time the inner constitution of the milk is in no wise changed.

The process has also proved highly useful in the preservation of eggs. The general practice in regard to this food is to preserve by means of lime or refrigeration. Both processes, however, exercise a deleterious effect upon the edible. On the other hand, submission to the carbon vapour shows that no such results are traceable. The albumen remains perfectly clear, while the yolk retains its original bright colour. The effect of the process is to fill up the pores of the shell and inner skin with an impermeable film, thereby rendering the contents perfectly airtight, in which condition the eggs will remain for several months without suffering any deterioration.

That the invention will be of practical value to other than food-preserving industries pure and simple has been testified by several experiments. It has been adopted for the preservation of furs, since the vapour spells death to the moth and other destructive pests. Similarly, it has been recently adapted to the sterilising of linen in hospitals, and several institutions are adopting the system. In this instance the material is immersed in the vapour for a quarter of an hour, which has been found ample for the destruction of the most virulent germs. Certainly the process is much easier and more expeditious than the fumigating processes generally in vogue for this purpose.

Another ramification of trade in which attempts are to be made to apply the invention is the silk-worm industry. At present the most delicate operation, one requiring skill and care, is the destruction of the chrysalis in the cocoon. It is anticipated that by exposing the cocoons to the action of the carbon atmosphere the chrysalis may be killed without injuring the silken filaments comprising its protective shield in any way.

It will thus be realised that the perfection of this simple process opens up vast possibilities, while its superiority to refrigeration is perfectly apparent. It will dispense with the cumbrous and expensive machinery necessary to maintain the frigid atmosphere in which the articles must be stored, and is simpler and far more economical both from the point of initial outlay and maintenance. Once acquired, the apparatus is everlasting, while the cost of treating the articles of food is practically insignificant, it being possible to preserve some two thousand pounds of meat for two or three shillings. Moreover, there is the additional advantage that the food-stuffs are not changed in any appreciable way by the action of the vapour—colour, taste, and appearance being retained for several weeks.

HIS INHERITANCE.

CHAPTER III.—O HATSU SAN.

HIDEO'S marriage took place when he was twenty-three, and before he left for England, in the following year, his mother had the joy of holding a grandson in her arms.

'You may go to England with a peaceful mind now, Hideo,' said his mother. 'You need not be anxious for us; Hatsu and I will be quite happy looking at the baby.'

Hideo took the arrival of his son very calmly, for his whole mind was engrossed with the thought of his coming journey. O Hatsu San, his wife, was secretly rather hurt at his indifference. Most of the young fathers she knew were devoted to their children, and were just as pleased with the little new-comers, though in a somewhat veiled way, as their mothers. Otherwise she had no fault to find with Hideo as a husband. He had been most exemplary in his attentions. On the different national festivals he had always taken her to places of amusement; they had gone to Ueno to view the cherry-blossom, and to Kameido for the wistaria. True, Hideo's mother invariably went with them; it never seemed to occur to any of them that she should not do so. When he went out anywhere with O Hatsu San, Hideo walked in front, while O Hatsu San would be a pace or two behind. It would have distressed O Hatsu San to have done otherwise; she knew that some of the very up-to-date young husbands of the day insisted on their wives walking beside them, but this she looked upon as a sort of affectation.

On one occasion Mr and Mrs Elliot came upon the trio seated in a tea-house among the cherry-trees in Ueno. Hideo was silently smoking a cigar, while his mother and wife were chatting together and looking at the passers-by. When he saw Mr Elliot, Hideo rose with great alacrity and begged him to sit down for a few minutes. This the Elliots willingly did, for they had not seen very much of Hideo since his marriage.

'I think that that marriage is going to turn out all right,' said Mrs Elliot after they had parted again. 'She is a most attractive girl.'

'Yes,' said Mr Elliot, 'she is a sweet-looking girl. The only question is whether he can get through life without falling in love. He is not in love with her—that is quite plain. I had hoped that after marriage, when he got to know her well, he might fall in love with his wife, as many Japanese men do. Did you notice how bored he was looking when we came up? Don't you think that he would enjoy that sort of thing if he ever could have it?' And so saying, Mr Elliot pointed to a group of young tourists in front of them. The girls of the party were talking to the men in the gayest way; they all seemed to be enjoying themselves immensely; they were full of life and spirits and interest in each other and all around them. When Mr Elliot thought of the young couple he had just parted from he had a sensation of pity for Hideo, a feeling that he had not had fair-play, that he had missed youth's brightness.

Mr Elliot, having undertaken to arrange for Hideo's time in England, wrote to a brother on the subject.

'The young man has been a ward of mine for many years,' he wrote. 'His father was an Englishman, his mother Japanese. He wishes to go first to a family to get accustomed to English life. A family with some young people would be best; he would feel less shy with them. Perhaps some college tutor could be found who would read with him, or some one who prepares young men for college. He has been brought up as a Christian.'

Mr Elliot carried his letter to the post. Just as he was about to drop it into the box he paused. 'Dear me!' he said to himself, 'I quite forgot to mention that Hideo is married.' He hesitated for a moment. 'After all, it can't possibly make any difference in the arrangements whether he is married or not. He must tell them all those particulars about himself when he gets there;' and so saying, he dropped the letter into the box.

CHAPTER IV.—BESSIE.

'HOW lazy you do look, Mr Lauder! Do get up and fetch the tennis-racquets! There is just time for a set before tea. And don't forget the balls. And, oh, please bring me my tennis-shoes. You will find them somewhere in the hall.'

The speaker was Bessie Gordon, who lay in a hammock under the trees, where she and Robert Lauder had been spending the summer afternoon. Mrs Gordon was there also, established in her favourite chair, where she had been comfortably napping. The young people both had their books, but most of the time had been spent in snatches of conversation. Bessie, however, now decreed that this state of affairs was to come to an end, and whatever Bessie decreed was obediently carried out. Robert Lauder rose from his chair.

'Tennis-racquets, balls, and tennis-shoes. Anything else?' he inquired.

'No,' laughed Bessie. 'You'll do very well if you bring all those successfully.'

Hideo's Tokyo friends would hardly have believed that Robert Lauder was the same person as Hideo Uchida. The personality of Hideo the Japanese young man had survived all through the voyage. He had been surrounded by Japanese

friends, and it was not till he had been a couple of weeks in England that a subtle change began to take place.

The house in which he had been placed to study for six months before going to Oxford was that of a Mr Gordon, a Devonshire clergyman, who had been in the habit for some years of taking young men to read with him. Walter and Bessie Gordon were a devoted brother and sister, and Robert was admitted to an intimacy unlike anything he had ever dreamt of. He knew numbers of Japanese brothers who were very fond of their sisters, but between Walter and Bessie there was an identity of interests and a companionship which was a revelation to Robert. He was accustomed to women who took the most affectionate interest in all the doings of their mankind. Sweet little O Hatsu San always ran to the door to welcome her husband when he came home; she would sit by his side and gaze admiringly at him while he related his day's experiences. If he had been boating, and could tell of some mild escapade on the Sumida river, she would give little sympathetic shivers and cries of '*Abunae! abunae!*' ('How dangerous! how dangerous!'). It was always a source of mystery to O Hatsu San why men should like to do dangerous things and get hot and dishevelled; but since they did like it, then women's duty was to be at home when their mankind returned, ready to listen sympathetically to whatever they might choose to relate.

Such was not Bessie Gordon's view of life. *She* never gave sympathetic shivers or cries of 'How dangerous!' When some unusually daring adventure was told, Bessie would listen with eager eyes and exclamations of 'What fun!'

In Tokyo, if Hideo Uchida, seated in front of his writing-table, called out, 'Oi, let me have the books that are on the top of the book-shelf,' his wife and mother both looked upon it as the right and proper thing that one of them should jump up and fetch the books. But in England, when Bessie Gordon wanted her tennis-racquet, her shoes, her garden-basket, her Prayer-book, or any one of the dozen things that she was perpetually mislaying, it soon seemed quite natural to Robert Lauder that he should roam round in search of them, while Bessie sat still. O Hatsu San had never dreamt of working her husband in that way; indeed, sweet, gentle little O Hatsu San would have been horrified if she could have seen some of Bessie's ways, and would very likely have condemned her as one of the unsexed creatures held up to the ridicule of the Japanese by the Tokyo comic papers.

During his first days in the Gordons' house Robert Lauder had been amazed at Bessie's tastes and pursuits. She appeared one day clad in a short skirt and thick boots, prepared to go out during a perfect tempest of wind and rain. Mr Gordon expostulated, but Bessie only laughed. 'Dear old dad,' she said, patting him on the head, 'you would like me to sit in the drawing-room and do worsted-work, wouldn't you?' In spite of her short skirt and thick boots, Robert soon saw, however, that Bessie was a most womanly woman. Her views of a woman's duties and those of O Hatsu San were very different; but when there was a call for help during sickness or trouble no one was more helpful than Bessie. When Mrs Gordon had one of her bad headaches it was only Bessie who was allowed into the room; her cool, firm touch seemed to rest the throbbing nerves. When Mr Gordon was despondent over his learned researches it was Bessie who sat with him and coaxed him out to walk, and brought him back with revived courage. Bessie was not strictly pretty, and she had none of the sweet femininity of the Japanese women, but she had an air of radiant well-being and perfect health which made her a very pleasant object to look at; and there were few who could resist the infection of her gay laugh. A succession of young men had been Bessie's devoted admirers and friends. With them all she was willing to be chums, and she was even willing to carry on a certain amount of wholesome flirtation; but if a young fellow threatened to become seriously sentimental, Bessie mocked. None of them had ever touched the romantic chord, which, in spite of her commonsense views of life, was very strong in her. There was nothing romantic about any of these young men. Some were sent to her father because they were stupid and had to be pushed on; some were sent because they were clever, and their parents were ambitious for them. They were clean, vigorous young Englishmen about whom there was no mystery or romance in her eyes.

It was quite different with regard to Robert Lauder. For two winters Bessie had pored over the accounts of the Russo-Japanese war. She was fiercely anti-Russian. Every Japanese victory filled her with enthusiasm. Her imagination was fascinated by the mysterious country which had been considered merely a sort of artistic playground, but which had suddenly stepped forth as a nation of warriors. The men who flung themselves upon the enemy reckless of everything but their country's honour seemed to her to be the embodiment of the heroic age of which she and Walter had been such passionate admirers in their childhood's days. The arrival of Robert Lauder suddenly brought her into personal contact with the nation she had admired from afar. There was nothing in his appearance to disillusion her in any way. He had inherited the tall, well-knit frame of an Englishman; the coal-black hair and somewhat sombre dark eye which came from his Japanese side gave him an air of considerable distinction. Everything about him had the fascination of the unknown, but though Bessie longed to hear about his life in Japan, she was not surprised to find that he was very silent on the subject; she had read in some book on Japan that a Japanese man rarely talks about his home.

Not one of the Gordon household ever imagined

for a moment that Robert Lauder was a married man. Robert, on his part, had not started with any intention of keeping the fact hidden. When he left Japan O Hatsu San had presented him with a photograph of herself in a most elaborate dress, the baby sitting on her knee swathed in endless *kimonos* of marvellous patterns. During the voyage Robert quite often took out this photo and looked at it with affectionate interest. He had been several days in the Gordons' house before he realised that beyond the fact of his mixed parentage they knew hardly anything about him. Shortly after his arrival a lady called on the Gordons, bringing a small baby with her. When Robert took the child in his arms she laughingly remarked on how well he held it. Robert was on the point of saying that he had a son just the same age, but a fit of shyness seized him, and he felt it to be quite impossible for him to make the simple little statement. The longer he put off telling the Gordons about his wife the more difficult it seemed to be to do so. He quieted his conscience by saying that, after all, it could not make any difference to any one whether he were a married man or not; but the sight of O Hatsu San's letters always gave him an uncomfortable sensation, and the elaborate photograph was soon put away in an unused writing-case.

Though Robert had seen something of English ways while in Japan, there was still much for him to wonder at, and many were the discussions held by the young people on behalf of their different views. The Gordons had had quiet lives, full of culture; but there was nothing cosmopolitan about them—they were true-born Britons with a healthy belief in all British customs. They were surprised to find how different was Robert's point of view; and Bessie heard him coolly criticising social customs which she had looked upon as fixed laws of nature no more to be criticised than the sun's methods of rising and setting.

'Why did I have to carry Mrs Carew's cup of tea for her?' demanded Robert one day on their return from a tennis-party. 'I was her guest; in my country the hostess waits upon the guests and not the guest on the hostess.'

'Oh, but surely,' said Bessie in a shocked tone of voice, 'a man ought always to wait upon a lady.'

'So you say,' said Robert; 'and it seems to me that the men here have to be doing things all the time; the English ladies think it all right if they just sit and talk to their guests. I was the guest, but I had to carry about Mrs Carew's tea and cake. In Japan a lady likes to do things for her visitor, and she never thinks whether the visitor is a man or woman. Of course, if Mrs Carew were delicate or old I would carry her tea for her; but she golfs and swims, so she is quite strong enough to carry her own tea.'

'Very well,' pouted Bessie; 'then I won't ask you again to carry anything for me.'

'For you I cannot do enough,' said Robert earnestly, 'and you know it. For am I not learning everything from you? How could I ever do enough for you?'

When a few weeks had passed in England, Robert's life in Japan had become like a dream of some different state of existence; every day brought him to a richer, fuller life, for he had never before known what it was to have stimulating companionship. His Tokyo boy-friends had been too much on his own level; his wife and mother had merely admired him. Walter and Bessie Gordon had a hundred interests and pursuits into which they initiated him with great zest. Their chief delight was boating. Good Mr and Mrs Gordon had a comfortable but quite unfounded belief that no harm could come to Bessie as long as her brother was with her; so they would walk down to the river to see a boating excursion set off, they would watch the quiet progress of the boat down the river, but beyond the bend they rarely troubled to go. They knew, but did not realise, what lay beyond, for the boat had only to go a few miles and then it went over the bar, out to the open sea. Could they but once have seen their darlings, tearing along with sail up before the wind, the boating would soon have been put a stop to; but Walter and Bessie kept their own counsel on the subject. Nothing in his new life excited Robert so much as the afternoons spent in the sailing-boat; it was so different from his boating on the Sumida river at Tokyo. His two companions were both adventuresome, experienced hands with sails. Bessie, with glowing eyes and cheeks flushed by the wind, sat by the rudder, her lithe young body bent forward in her excitement; she looked like the embodiment of some young Norse maiden.

As the boat cut through the water, passing the red cliffs and wooded promontories of Devonshire, the Atlantic breezes that blew on him and the salt spray that dashed in his face seemed to send a new life tingling through Robert's veins.

(To be continued.)

SOME INTERESTING FACTS ABOUT AUSTRALIA.

By T. H. SMEATON, M.P., South Australia.

I HAVE just read a chatty little article in the January number of *Chambers's Journal* on 'Australian Railway Travel' which has both pleased and amused me. It is written in such a frank spirit that, even while the story it tells hardly conveys to the reading-world an adequate mental picture of the setting of the facts which are related, the writer must be acquitted of any offence more heinous than that which is so common to globe-trotting historians as a class—namely, that of putting on record the things which, being obvious to himself, are held to be conclusive; but, being unconditioned by facts necessary to give the picture its true perspective, can only result in conveying a faulty impression.

It is not, therefore, a carping or fault-finding spirit which prompts me to submit to the readers of *Chambers's Journal* a review of the subject-matter affected by the article referred to, but rather the desire that they should be made aware of such facts as will enable them to appreciate it at its true value.

I select the following quotation from the article in question as a sort of text on which to base my own: 'Railway travelling is above all things leisurely. Dining-cars were until recently unknown throughout the continent, and the rolling stock soon reveals the glorious confusion of interstate administrations.'

Now, while that is perfectly true in fact, it conveys an impression not altogether complimentary to the people of Australia, as seen from the tourist's point of view; looked at from the Australian standpoint, however, it takes a different appearance. Picture Australia, if you can, thus: an island large enough to contain comfortably within its coasts the continent of Europe, first colonised by white people a little over one hundred years ago; its five mainland states necessarily developing their own individual institutions, and, because of the distance between their earliest settled areas, more removed from each other's influence than are the people of Scotland, England, and Ireland. That is a bald statement of fact. Now then for deduction. Is it surprising that in the pioneering days of these states the things that immediately concerned themselves should be, to the handfuls of people concerned, the most important; or that—in the strenuous fight with conditions which, to be understood, had first to be conquered—each colony should have developed its conveniences, with an entire regard to its own necessities, in a way and with a thoroughness which cannot under the circumstances be said to be wholly selfish? Looking backward from this year of grace, we Australians see much which might have been done by individual states, even in the last half-century or less, to co-ordinate institutions and methods of government to their mutual advantage; but having ourselves taken part in the work, we know how inevitable it was that autonomous states should think first of themselves, and that their development should have been conditioned by their own individual necessities.

It is in the experience of life, which cannot be either gifted or bought, that there is a stage in the evolution of men and nations when the truth is borne in upon them that they cannot live to themselves alone. In that day they learn to weigh up what they have done, and judge of what they might have done to better advantage. The federation of the states marks that stage in the history of Australia, and now we are devoting ourselves to doing those things which appear to be our duty as far as can be done without undue interference with the individuality of states. I make these remarks, which have a general application, but in this case with special reference to the break of gauge in the railways of Australia. We know perfectly well the inconvenience of it to the interstate travellers. We know that it is no pleasure to them to turn out of a comfortable sleeping-berth on a frosty morning at Terowie in South Australia or at Albury in New South Wales, to be transferred bag and baggage to another train, all because of a difference of railway gauge, at which, under such circumstances, we do not blame them for growling. But then, not being globe-trotters, we remember with gratitude the pluck of the pioneers who went out into this country and led the way for railway communication such as it is; and those of us who feel that we have inherited their responsibilities are even now busied with the problem of dealing with the present-day disability which we cannot in honour put to their discredit. We do not forget that, great as this Australia of ours is proving to be, the time is still with us 'the day of small things;' and surely we may be forgiven if we point with justifiable pride to the things which have been done, even while we are improving some and undoing others. Our railway speed may appear to be 'leisurely' even to ourselves; but then we remember that even our 'express' traffic passes through country which we are developing, and that the loss of a few hours on a journey of, say, four hundred miles is the price which we have still to pay for such luxury and convenience as we enjoy. But even this day of 'leisurely' speed is passing away, and the time is not distant when we shall be running our express traffic at something approximating British speed. Recent as was the visit of our kindly critic, we seem to have made certain notable improvements in

our railway conveniences since that event, for we are now running on our interstate lines boudoir and corridor carriages built in the South Australian and Victorian State workshops which are as well built, comfortable, and elegant as anything on the British railways.

There is much which the article in question has suggested that may be of interest to my fellow-readers of *Chambers's Journal*, and which, as an old Glasgow man resident in Australia for the last thirty years, I may be pardoned for placing before them.

Let me say that life in Australia is differently conditioned from that in the homeland. In the latter you are congested in your cities, and even country life, as compared with that of Australia, is cramped and confined. Australian centres of population are far apart; its cities and towns, excepting in the oldest parts of them, are wide-spreading and interspersed with gardens. In all of them there is a general feeling of having plenty of elbow-room, combined with solidity and comfort. Then it is difficult for those who do not know Australia to realise what its farming-country is like. Our farm-holdings run to thousands of acres, just as yours do to hundreds; and, taking that as a basis for computation, it will be seen how much this one fact alone must affect our social, commercial, educational, and religious institutions. A dozen of our South Australian farms would cover one of your counties, and a sheep-run of fifty thousand acres more effectually bars intercourse between settled areas in Australia than does a German principality in Europe between others which adjoin it. This is a country of magnificent distances, and I am sure it will not require any laboured demonstration of mine to prove how proportionally costly, therefore, must be the conveniences and necessities of our complex civilisation. It has been suggested, rather than said, by the writer of the article in question that Government control of these is not so advantageous to the public as would be their operation by private enterprise. Now, that is a fallacy which we have proved for ourselves. The fact is that, were it not that the State owns and controls the machinery of our public services we should still be in the dark ages of national development. Private enterprise takes few risks in the things that are most necessary for nation-building, and it is a thing to be profoundly thankful for that the Australian people have already learned the value of national co-operation in so much that is of mutual importance to them.

The immediate destinies of this island-continent are in the hands of just four millions of people, Settlement has, quite naturally, hugged the coastal fringe of it, yet see what has been done with it even in the comparatively small portion that is occupied! The total trade of Australia for the year 1907 was one hundred and twenty-six million pounds, an advance of ten million five hundred thousand pounds on the previous year, and that again an advance of an almost equal amount on the year 1905! Much is heard in Great Britain of the wonderful progress which Canada shows in her trade records; but I think it is not quite realised how much greater is that of Australia in actual returns, and greater still by comparison. In 1906–7 Australia's trade aggregated one hundred and fourteen million five hundred thousand pounds, while Canada's was fifteen million pounds less; and be it remembered that the population of Australia is four millions as against Canada's six millions! I quote these figures less for purposes of comparison than to illustrate another point which I am sure will be appreciated, and with which I shall conclude. I submit that such a volume of trade is only possible to a live and enterprising people; and I think I am not begging for a consideration which is not due to any people who are similarly hammering out their own destiny when I ask that their institutions should be judged in the light of the difficulties which have had to be confronted and conquered rather than by comparison with those of countries where conditions have all the staid respectability of age and long experience.

'THE OLD ORDER.'

By HAROLD AVERY, Author of *An Arm-Chair Adventurer.*

THUD! thud! thud!

Like the throbbing of a pulse in the warm evening air comes the first sound of the approaching drum, causing my own youthful heart to beat more quickly; while round at the back of the house the shrill voice of a housemaid is heard calling through the scullery window to the cook, 'Look sharp, Martha; they 'm coming!'

The 'they' refers to the Seventeenth Blankshire or Ditchborough Company of Rifle Volunteers, to give them the title they bore on this particular summer evening now more than forty years ago; and they are marching to the field of glory, which on this occasion is *our* field, and I am to sit up for at least an hour later than usual to witness the battle. The captain of the corps, a truly martial figure in his tight-waisted tunic, and shako with its plume of cock's feathers, has just bidden farewell to his family before proceeding to the front; and, though in civil life he happens to be my father, I have watched him climb the iron railings which divide our garden from the battlefield dry-eyed and even jubilant.

The Duke of Wellington's cook, we are told, went about the work of preparing his master's evening meal even before the result of Waterloo had actually been decided; and, with equally sublime confidence in the prowess of our local heroes, we have provided for 'the end of this day's business ere it come' a barrel of beer and unlimited bread and cheese. The stern simplicity of the menu is, I think, intended to be recognised as evidence in itself of the hardihood of which our rank and file are capable when arrayed in their rifle-green; for, at this period, the greater part of them are not of a class accustomed to eat their food with the aid of a pocket-knife.

Thud! thud! thud!

The sound, growing louder every moment, fills my breast with martial ardour; and out through the French windows of the dining-room comes my mother, followed by Aunt Fanny, whom even such monstrosities of fashion as the crinoline and chignon can never make look anything but charming. Just now, wearing that coquettish little 'pork-pie' hat, and with the red, evening sunlight deepening the colour in her soft cheeks, she looks more bewitching than usual; and surely here is an instance where 'none but the brave deserve the fair.' The two ladies follow the path through the shrubbery, and pause when they reach the iron railings of the meadow, having failed to observe the small boy who has taken up a post of observation on a branch above their heads.

'I don't believe you really mean what you say,' murmurs my mother in a low and somewhat reproachful tone; adding after a pause, 'and you are going away to-morrow.'

Aunt Fanny replies with an independent little toss of her head.

'You hurt his feelings by what you said the other night,' continues my mother. 'I could see he thought you meant to be rude.'

'And so I did,' said Aunt Fanny in the most unrepentant tone. 'I am surprised he should come here this evening at all when he knows'——

'My dear, he can't help coming when he's on duty,' interrupts my mother.

'He's very touchy and ill-tempered,' says Aunt Fanny, after a pause devoted to smelling the rose-bud she carries in her hand. 'He behaves just like a spoilt child.'

'He behaves like any man might be expected to when treated as you treated him at supper. You take it for granted that a pretty face is a sufficient excuse for a sharp tongue, Fanny.'

'As I have neither the one nor the other, that remark can't apply to me,' says my aunt demurely.

There is another pause, during which Aunt Fanny's little hand, resting on the iron railing, begins to beat time to the sound of the old quick-step, now becoming louder than ever as the band turns off from the high-road into the lane.

'I know he looks rather a fop,' begins my mother, 'and affects the fashionable drawl in speaking'——

'My dear Julia, I'm sure there is no need for you to apologise to me for Mr Whetherby's personal appearance,' retorts Aunt Fanny in a tone which sounds quite snappish. 'You've never heard me say that he looked at all foppish.'

My mother smiles, and the two ladies move away along the path which borders the railings, while it dawns upon me that the person about whom they have been talking is the dandified corporal, who is really a very fine fellow in spite of his whiskers and eyeglass. During the three weeks of Aunt Fanny's visit he has taken quite a fancy to me, and, having presented me with a miniature rifle which fires real percussion-caps, has come almost every evening since to teach me the manual exercise.

The head of the column debouches through the lower gate into the field; and, descending from my perch, I join my women-folk to watch the martial spectacle which is now presented to our admiring gaze. What gallant fellows they are, the Seventeenth Blankshire, from the dashing sergeant-instructor with the terrible voice and the Crimean medals, to the diminutive and much-envied youth who plays the cymbals in the band! With what steadiness they 'wheel like a gate and march like a wall,' and how warlike is the flash of bristling steel as square is formed and bayonets fixed to receive the baker's horse, which stands gazing over the neighbouring hedge in prick-eared amazement. The effective range of the muzzle-loading Enfield may fall far short of modern weapons, but the charges of black powder produce a most delightful amount of noise and smoke; and every time we think the firing is going to commence, Aunt Fanny is compelled to put her fingers in her ears.

In the course of its evolutions the company halts close to where we are standing, and the order is given to 'stand easy.' The corporal withdraws from the supernumerary rank and approaches us. Raising his hand to his plumed shako, he and the ladies exchange formal greetings, after which my mother engages him in conversation, while my aunt turns to talk to me. Aunt Fanny wishes to know what I would like to be when I am a man. Would I like to be a soldier—that is to say, a *real* soldier?

'Com-pan-y!'

The cautionary command hurries the corporal back to the ranks.

'Fanny, why *do* you say such things?' inquires my mother in a whisper.

'I only asked the child a question,' says Aunt Fanny. 'I suppose I may be allowed to do that, mayn't I?'

And now comes the part to which I have been looking forward all the evening—the sham fight. Joseph Huggins, who, I think, must have something to do with the commissariat department, and whose duties on occasions such as the present are to tap the beer-cask and superintend the supply of bread and cheese—Joseph Huggins, I say, wearing a

forage-cap and big white apron, comes to my side, and explains to me the general idea to be followed in the coming conflict. An invading army (Blue), represented by the Seventeenth Blankshire, under my father's command, is advancing on Polchester (twenty miles distant) from the south-west, but is checked by the appearance in its line of march of an outpost of the defending forces (Red), consisting of eight men under the command of Corporal Whetherby, who have entrenched themselves in our shrubbery with the determination to hold the foe in check at all hazards.

The corporal and his heroic handful disappear amongst the trees and undergrowth; while, far away on the opposite side of the meadow, a half-company extends in skirmishing formation, and the varying width of the intervals not meeting with the approval of the sergeant-instructor, they are ordered to close on the right and do it over again. At length the advance begins, and the bugle gives the welcome signal to open fire.

Pop-pop-pop! comes from the line of kneeling skirmishers, and *bang-bang!* from the shrubbery, these last reports being near enough to make my mother and Aunt Fanny jump, to the great delight of that superior male personage—myself.

The action grows hotter. In the twilight the ruddy flashing of the rifles is almost as delightful to watch as a firework display, and quite as noisy. The white smoke curls upwards amidst the trees in the shrubbery where the corporal and his men are nobly making their stand for 'England, home, and beauty.'

'The left 'alf-company 'll reinforce,' explains Joseph Huggins, speaking loudly in my ear. 'Then it 'll be independent firing, then cease fire, then fix bayonets and charge. Oh, bless you, no! they won't go sticking anybody. Before they get to the rails the bugle 'll sound the 'alt, and then the assemble. Good lor'! what 's that?'

The cause of this exclamation is a curious buzzing sound heard even above the din of the firing, and followed almost immediately by a loud shout from the shrubbery.

'Good lor',' repeats Huggins, a sudden look of alarm appearing on his ruddy face, 'that was a ramrod!'

Before I have time to realise the significance of this remark the firing on both sides ceases, that of the attacking force giving place to a verbal discharge of a still more lurid description on the part of the Crimean veteran, while a member of the defence, appearing at the edge of the bushes, bawls out a sentence, a portion only of which is audible above the general hubbub.

'Mercy on us,' cries Joseph Huggins, 'they 've shot Mr Whetherby!'

He starts off at a run, with me following at his heels; but as we go a light-footed figure speeds past us, and I feel a twinge of mortification at the discovery that Aunt Fanny can run faster than her nephew. She rushes on into the shrubbery, where the reek of powder-smoke is still strong amidst the trees, and suddenly finds herself standing face to face with the corporal, bareheaded, but with his monocle still firmly fixed in his left eye.

'Are—are you hurt?' gasps Aunt Fanny. 'I thought I heard a man say'——

'Oh no, Miss Allerton; pray don't distress yourself. A near shave, though; it went through my shako, and'——

As if to lean against the trunk, Aunt Fanny moves unsteadily towards a tree; she stumbles, and the corporal, springing to her side, offers her his arm.

'Thank you,' she murmurs. 'The smoke is—I shall be better in a minute.'

. . . . . .

According to the rules of the Seventeenth Blankshire, 'Any member making improper use of his sword or other weapon will be temporarily deprived thereof, and will render himself liable to a fine of two shillings and sixpence;' but though the recruit who fired his ramrod into our shrubbery has certainly been guilty of 'improper use' of his rifle, I think the corporal bears him no ill-will, and would be ready to let him off with a caution.

The beer is finished, and the 'fall-in' sounds. Cheers are given for the captain, the corps marches off under the command of the ensign, and the *thud, thud* of the drum dies away in the distance. Mr Whetherby has been invited to remain at our house to supper, though I am not aware of this until, in the deepening dusk, while making a strategic movement to avoid my nurse, who is summoning me to bed, I come suddenly across the corporal and Aunt Fanny sitting very close to each other on the rustic seat beneath the old yew-tree.

'You weren't shot after all,' I remark, in a tone which might almost be thought to suggest a tinge of disappointment.

'No, I wasn't shot,' says he; then, fixing me with his eyeglass, adds solemnly, 'A miss is as good as a mile.'

Aunt Fanny laughs softly, and, giving me a good-night kiss, bids me be a good boy and go to bed, which I accordingly do, wondering in a vague, childish way why the gathering darkness should make her voice sound so low and sweet. The corporal gives me what I appreciate far more than kisses—namely, some percussion-caps for my toy gun, and promises that when I have whiskers I too shall join the volunteers.

Alas! where are they now, the gallant Seventeenth Blankshire of my childhood? Gone the way of muzzle-loading rifles and close formations. A street of modern semi-detached villas has been cut through the centre of their ancient battlefield, and for the large majority their warfare is accomplished. 'The old order changes,' but not so the story to which Aunt Fanny listened on that memorable evening beneath the spreading branches of the ancient yew—the old story which is never pronounced obsolete or considered out of date.

A FAITHFUL SERVANT OF MARY STUART.

ADAM BLACKWOOD (1539–1613).

By the Hon. Mrs MAXWELL-SCOTT.

THE Royal House of Stuart has perhaps called forth more personal enthusiasm and devotion than any other dynasty; and if, during her lifetime, Mary Stuart had many bitter enemies, she also possessed the most devoted friends and servants. It is to be noted, moreover, that amidst the storms of her reign history shows no record of any of her own intimate friends or members of her household proving unfaithful to her. On the contrary, all who could do so were willing to follow her to the end, and cheerfully shared her imprisonment, while others worked no less zealously for her interests at home or abroad.

Among these faithful followers Adam Blackwood is well known and has a special place, and it may be interesting to gather together the few facts regarding his history which have come down to us.

Adam Blackwood and his brothers Henry and George, all distinguished men, were the children of William Blackwood of Dunfermline, and Ellen, daughter of John Reid of Aikenhead, niece of the illustrious Bishop Robert Reid of the Orkneys. Their paternal grandfather, and the first whose name we find recorded, was a certain John Blackwood, squire to the Duc de Guise, father of the Cardinal d'Amboise, which shows that the family connection with France had already commenced.

Adam was born at or in the neighbourhood of Dunfermline in the year 1539, and when about ten years old lost his father, who died fighting for Scotland at the battle of Pinkie. His mother did not long survive her loss, and Adam and his brothers owed their excellent education to the affectionate care of their uncle, Bishop Reid. This admirable prelate sent the young brothers to the university at Paris, where they all distinguished themselves. Later on Adam studied civil law for two years at Toulouse, thus fitting himself for his future career. It is said that he returned to Scotland during Queen Mary's reign, but owing to the religious difficulties of the time went back to France, which henceforth became his settled home. After the death of his uncle, which occurred suddenly at Dieppe in 1558, when the bishop was on his return journey to Scotland after assisting at Queen Mary's marriage to the Dauphin, the Archbishop of Glasgow, James Beaton, seems to have taken Adam under his special protection. He mentioned him to the young royal couple, and by their recommendation Adam was admitted as member of the Parliament of Poitiers, and was made one of the judges of that court. Poitiers became his home, and he there married Mademoiselle Catherine Courtinier, daughter of the Receiver-General of Finance for Poitou. They had a large family of eleven children, and there are still in our day descendants in the female line who claim Adam as their ancestor. Adam lived to the age of seventy-four, and his long and honourable life seems to have been devoted to the duties of his state and profession, and in a particular manner also to literature. He published several works, of which the best known are his reply to Buchanan's famous book, *De Jure Regni apud Scotos*, and his *Martyre de la Reine d'Ecosse*, published in the year of her death, 1587, in which he writes of '*Ce qui j'ai veu et sceu.*' In 1598 Adam brought out another work, a manual of devotions, dedicated to his venerable friend Archbishop Beaton, at whose suggestion it was compiled. 'The cause of his writing this book was that by reading much at night he had so weakened his eyes as to be unable to distinguish his own children at the distance of two or three yards.' He was, therefore, prevailed upon by his old friend to read less and to 'betake himself to a custom of nocturnal prayer.'

It is very tantalising not to know more of Adam's personal relations with Queen Mary. She made him a Privy Councillor, but at what date we know not; and again we find mention of him in

 [*All Rights Reserved.*]

a letter of the Queen's to Archbishop Beaton, under date probably of 1576, in which she complains of the slackness in her service of the secretaries of the French Ambassador De Mauvissière; adding, 'If, therefore, you could obtain that I should have a secretary attached for my service [to the same] I should be very glad if Adam Blackwood rather than another could be employed for this' (Labanoff, *Recueil*).

This unfortunately never came about, but we know that Adam made several journeys to England in the Queen's service, and even, we understand, saw her a short time before her death. But here, as so often happens in history, we must mourn the lack of any records which would enable us to assist in spirit at a meeting of such interest. One great service, as we know, Blackwood was enabled to render to his Queen in the erection of the famous epitaph in Peterborough Cathedral, which, if 'it continued not long, but was taken away and cast aside,' seems to have had the honour of being the only public testimonial to Queen Mary's memory attempted by any of her followers in England or Scotland. Great search was made for the author of the epitaph, but happily in vain. It is rather mysterious to find that Blackwood was attached to James VI., and that he should have been a *persona gratâ* with the ungrateful son of his injured mistress; but we find him celebrating the King's accession to the English throne in 1606 by a Latin ode, and previous to this James had made him Receiver of his mother's dowry in Poitou. This we learn from some interesting letters communicated to the *Archives Historiques de Poitou* in 1901 by one of Blackwood's French descendants, M. Pierre Chareyron.*

There are ten letters in all, the first dated Edinburgh, August 1st, 1602, by which James creates Adam his 'true and legitimate Procurator' to gather in the moneys due to Queen Mary, and declares he does so on account of the knowledge he has of his 'probity and fidelity,' and for the praiseworthy report he has had of his long and faithful service to the 'very illustrious Princess Marie of good memory, Queen of Scotland, Dowager of France, Countess of Poitou, our very dear Lady and Mother.'

The appointment was approved by Henry IV. of France—a monarch always favourable to Scotsmen—in the January of the following year. In 1604, however, King James made over all that remained of Queen Mary's French dowry to Lodovic, Duke of Lennox, Earl of Darnley; and the remaining correspondence of Adam Blackwood and his nephew, Jacques Blackwood, with the Duke of Lennox and others regarding business affords little of interest to the biographer.

In 1604 Adam made a journey to London, and was presented to the King, who received him very graciously, and pointed out to him in the royal library a copy of his reply to Buchanan's book, which had been originally dedicated to James as well as to his royal mother.

Adam died at Poitiers in 1613, and was 'most splendidly interred' in the church of St Porcharius. His marble monument bore a long Latin inscription,† but it was unfortunately destroyed at the Revolution. Thirty-one years after his death his works were published in one volume by Gabriel Naudé, together with a panegyric of the author; but, as Monsieur Francisque-Michel observes, this is written in so declamatory a style that it is not easy to discover the distinguishing features of Adam's life and character. We learn, however, from it what our own study of his history also tells us, that Queen Mary's high opinion was merited, and that, in the words of a fellow-countryman of our own day, Adam 'was not only a man of consummate learning and great genius, but is allowed to have also fulfilled in life all the duties of a good man.'

Some years ago the present writer had the pleasure of hearing from the late Lord Dufferin and Ava that he claimed kinship with Adam Blackwood, and she received from the present Marquis a rough chart and two coats of arms, showing that while it is now impossible to trace the exact relationship between Adam and Lord Dufferin's ancestor, John Blackwood (1591), there is little doubt that they belonged to the same family. John Blackwood seems to have emigrated to Ireland in the sixteenth century.‡ Lord Dufferin and Ava possesses a portrait of Adam Blackwood, and also a still more interesting treasure—namely, the autograph manuscript of his *Sanctarum Precationum Proœmnia*, written on the flyleaves at the beginning and end of a *livre d'heures* given to Adam by Queen Mary.

In conclusion, is it possible to hope that some further details of the life of this staunch adherent of the House of Stuart may still be forthcoming? We cannot but trust that there may be documents relating to him hidden away which will eventually bring to us a clearer knowledge of so interesting a personality.

* By the marriage in 1796 of Marie-Thérèse de Blacvod with Philippe Bellin de la Boutaudière.

† See collected works.

‡ Some interesting allusions to Adam and others of his name may be found in Dr Erskine Beveridge's interesting *Bibliography of Works relating to Dunfermline* (Dunfermline, 1901).

A PAWN IN THE GAME.

CHAPTER XXXII.—IN THE DESERT.

ON the fourth day they struck the real desert, and Jack never forgot the spectacle: the vast, melancholy, empty landscape, as level as the sea and as measureless, but with a deeper loneliness lying on it than even the sea can know; no life of leaping waves, no music of wind-whipped waters, no gleam of leaning sail—a Dead Sea of sand; no shadow of bush or tree; no wing in the sky, not even of that feathered hunger the vulture; so empty of life that Jack felt that the sight of a lizard scurrying in the hot dust would have been welcome; a dead world, and, as he soon realised, above it a sky of fire.

The heat grew so intense towards noon that it was difficult to breathe. The gray floor of the desert seemed to undulate like water in the fiery atmosphere. Even the Arabs suffered. They sat on their camels with bowed heads in melancholy silence, plodding on in the still, unbreathing, intolerable heat. The sky was a flaming bowl above the scorched earth, and Jack felt that he and his companions were like a cluster of insects being grilled.

The sun went down in a sea of bloody colour. Slowly the tints grew faint, the flames died on the rim of the horizon; and at last came the cool night, with its arch of vaulted blackness pricked with stars like spear-points of fire.

Jack thought nothing could exceed the suffering of that first day in the desert, but three days later came a still more terrible experience. A curious grayness seemed to creep over the sky. The slate-coloured landscape narrowed; a hot and strangling mist gathered about them; it was stirred with waves of heated air that presently grew into a breeze, and then beat upon them like a tempest blowing from the open doors of some great furnace. The blown sand driven into their faces pricked them as if they were needles of fire. For hours that dreadful and scorching wind blew. The Arabs halted, covered their heads with blankets, and sat with their backs to the gale. When at last the rush of fiery air ceased, Jack felt as he drew in each breath as though his very lungs were scorched.

Late that afternoon he saw to the west, above the haze that seemed to lie on the surface of the desert, a faint blue, jagged line. He guessed it must be the Sinaitic range, and betwixt it and them was the head of the Gulf of Suez. The time had come when he must make his dash for freedom.

He looked long and steadily at the distant peaks, and tried to adjust the whole landscape to what he remembered of the map so as to know what line to take when darkness fell. He must watch the first stars that rose, and so fix his course. He glanced round on the little band. The Arabs seemed careless and unobservant, and with a quickened pulse Jack saw the hour had come for a supreme effort. He had managed to secrete some dates; he felt Corporal Lebrun's pistol hidden in the folds of his dress; he would steal a camel with its water-bag, and he determined grimly that at the cost of life—his own or others'—he would escape.

Night came slowly. The sun, a ball of red fire, seemed to linger on the horizon; its rays lay like diverging bars of crimson flame on the level sand. Jack watched with impatient eyes for the colours to fade. At last the huge red disc sank below the horizon; the cool night fell on them. The band camped; tents were put up, food taken from the packs for the scanty meal, and fodder spread for the camels; and, sitting apart, Jack watched eagerly for the first star.

But no star came. The figures of the camels and of the Arabs about him seemed to fade. There was a blackness in the very atmosphere that deepened until it shut off all objects. He seemed to himself, somehow, in a cave of impenetrable gloom. The inky gloom pressed upon his very eyes. What strange eclipse was happening? As he sat he heard the crackling of the fire behind him, and turned to look at it, but he could see no fire. He heard sounds—the sounds of voices, of camels feeding, and an occasional laugh—but he could see nothing. He peered in every direction in vain. Were his senses failing him?

Then he began to tremble. The terrible fact crept into his consciousness: he was blind! He knew it without question or doubt. A cry broke from his lips. It seemed to arrest the attention of the Arabs, and he heard the sound of feet in the soft sand about him. The sheikh spoke to him harshly, but Jack made no answer. He stood trembling, with his hands pressed hard on his eyes. Some one plucked his hands away; a rough finger and thumb parted the eyelids and held them apart for a moment. He heard the chatter of eager voices about him, and then a careless laugh. The Arabs moved away, and Jack stood alone. They had detected his blindness, and turned away with a laugh. So hard can men be!

He flung himself down and buried his face in the sand. He did not weep, but his body was shaken with dry, involuntary, convulsive sobs. A blind slave in the pitiless desert, and amongst men whose hearts were as destitute of compassion as the sands across which they rode! Escape henceforth was an idle dream. The darkness about him was a prison stronger than stone walls or iron bars could make. His very soul was shaken with the storm of passion and despair that swept through him.

He lay silent and almost heart-broken while the

desolate hours crept past. It seemed in that dreadful experience as though God had forsaken him, or even was mocking him. Then his thoughts turned in a passion of grief to Denise. He tried to picture her face; but for some time it was as though his imagination as well as his eyes had been scorched into blindness. He could not call up the vision of her face. The disorder of his feelings seemed to paralyse his memory.

Then, in the darkness, obeying some blind, unreasoning impulse, he called to her aloud, 'Denise! Denise! Denise!' An Arab sitting near stepped to his side and stooped over him with a laugh. What was the blind Kaffir saying?

At that very hour, in London, Denise turned in her sleep. She awoke and sat up quickly. Some voice was whispering her name in the darkness about her. Thrice she heard herself called, 'Denise! Denise! Denise!' The sound was faint, far off, as though coming to her across immeasurable distance; but she knew it was the voice of her lover. She sat wide-eyed in the darkness, trembling, listening. From what remote depths of space the voice seemed to come! But the whisper was not repeated, and she broke, she hardly knew why, into passionate weeping. The sadness of that thrice-repeated call seemed to rend her very heart.

Presently the weeping girl rose, slipped on her dressing-gown, and hurried along the passage to her aunt's room and knocked wildly at the door.

'Oh aunt!' she whispered, with streaming eyes and quivering lips, 'Jack is calling me. I heard him. He called my name three times.'

Her aunt looked at the white face, the dilated eyes, of the trembling girl. She was too wise a woman to tell her it was only a dream. Perhaps the story, authenticated by the girl's passion of grief, touched some chord of superstition or of sympathetic imagination in Mrs Lawrence's own breast. With an impulse of wise and pitying motherhood, she took Denise into her arms.

'My dear,' she said, 'I will stay with you for the rest of the night.'

'But, aunt,' said Denise in a trembling voice, 'can we do nothing?'

'Yes, my dear,' she replied with decision, 'we can pray;' and the two women fell at the bedside in silence.

If Jack could have seen the bent heads of the praying women so many thousands of miles away it might have soothed him. Perhaps some mystic sense of the love that was praying for him, or a dim, unconscious trust in the Love to which that prayer was addressed, fell on the poor fellow's spirit as he lay on the sand, for he slept.

(To be continued.)

FARM BUTTER-MAKING.

EVERY one knows that most of our butter comes from abroad. A good deal of it comes from foreign countries; but much of it also is imported from our colonies, and this butter is among the best that is consumed in this country. The excellence of the Australian butter is due to the fostering care and protection of the Government of the Australian Commonwealth. Not a single pound of butter is allowed to leave that country unless its quality has received the approval of the State. This interference of the State with the right of the individual to produce bad butter and to sell it where he likes has given rise to the growth of successful butter-factories in Australia; and, owing to the alertness of the Commonwealth's vigorous 'grandmotherly legislation,' Australian butter has achieved a world-wide reputation.

We have recently been confronted with a remarkable shortage of butter in the market. It was in vain to appeal to the British farmer to make up the supply. Butter-making in English farms has fallen into desuetude. The public have for so long preferred the cheap and nasty products of the bone-factory to that of the dairy; the railway companies have given preferential rates to foreign butter-merchants; and the English Government has so persistently neglected the fostering of the production of farm-produce in this country that the British farmer has given up producing butter on any large scale, and has turned his attention to the sale of milk alone. There are, however, a number of small farmers who, like myself, do not enter into contracts with milk-dealers, and there are other large farmers who are too inconveniently situated by distance from either railway stations or towns to take up a milk-contract. Many of us muddle along as best we can, which means that a number of farms are at present being worked inefficiently, to the loss of both consumers and producers.*

The English farmer suffers not only from the blends of spurious butter introduced by the manufacturers, but also from his own lethargic indifference to co-operation. English dairying has declined so much that the farmer now, as a rule, only produces butter when the grass is growing, and lets his cows dry off when he would have to put his hand into his pocket to feed for milk-production—that is, in the winter; for he is fully alive to the fact that the winter production of butter does

*To show with what assiduity firms who traffic with blended butter ply their trade, I may say that I received the other day this communication from a firm of hide and skin brokers: 'We read your article in the *Daily Mail* of to-day, and we see our way to a combination which may be of mutual interest. Should you be inclined to consider same we will arrange for an interview.'

not pay. Hence in winter there is always a shortage of English butter. He is not going to trouble himself to compete against foreign butter at one shilling and twopence a pound.

Let me give a convincing illustration taken from my own account-books. Here are the receipts and expenditure placed against four cows which were milked from 1st October 1907 to 29th February 1908, only two of the cows, however, being in full profit, the others having calved last spring: RECEIPTS.—Butter, three hundred and twenty-six pounds sold at one shilling and threepence per pound, £20, 7s. 6d.; new milk sold, £6, 6s. 7d.; separated milk (estimated), £2—total, £28, 14s. 1d. EXPENDITURE.—Feeding-stuffs purchased, £7; proportion of man's wages, £14, 8s. 10d.; proportion of rent, £8, 2s. 6d.—total, £29, 11s. 4d. Here, as one can see at a glance, there is a loss. Instead of estimating the amount of hay consumed by the four cows, which would be rather difficult, as there are other heads of stock kept on my farm, I have charged against the four cows the cost of hay-making, based on their proportion of the total number of stock kept, as well as of the rent of the land they proportionately occupy.

Past and present Governments, heedless of anything in the way of agricultural reform—so alluring is the clamour of the vast multitude of margarine-eaters, whose votes count for more than those of the butter-producers—attempt nothing in the way of the reorganisation of our decadent agriculture. Of course I am quite aware of the passing of the Small Holdings Act of 1907. We are told that the gates of the Promised Land have been opened, and that a multitude of land-hungry peasants will fill their own stomachs as well as help to fill those of other people. With infinite patience and drudgery, with a life of endless spade and hoe labour in front of them, this emancipated race of free yeomen may certainly add to the number of the heads of cabbages grown in this country; but I doubt if a single ton of good farm-butter will be placed to our national credit by their individual efforts. Working with less capital, and probably with less experience, the small holder of to-morrow is not likely to achieve greater distinction in the dairy than the farmer of to-day. The co-operative clause in the Act, not being in any sense obligatory, will be as inconclusive in operation as it is weak in construction; and it is indeed probable that a competitive, disunited race of small holders will fall before the enterprise of a united race of foreign producers aided by their State.

Now, in my opinion, the present losses on butter-production in winter, to illustrate which I have given my own personal experience, could be turned into a profit if farmers were backed by an energetic State Department of Agriculture. We know what the Irish Board of Agriculture (under the able administration of Sir Horace Plunkett) has done to revive winter dairying in Ireland by the introduction of co-operative factories and creameries; and the splendid success achieved by the State-aided co-operative factories in Australia is now common knowledge. Why, then, should not the English Board of Agriculture assist in the promotion of a number of butter-factories throughout this country, where the butter could be rigorously supervised by officials, in order that it should maintain a high standard of excellence and uniformity in quality? The cost of production would in this way be cheapened. Collection and distribution could be undertaken by the factory; and by the erection of a large central granary, cow-keepers, by obtaining extra storage facilities, would be able to buy feeding-stuffs co-operatively, and therefore more advantageously. The consumer would benefit by the introduction of these butter-factories as well as the producers. He would have the satisfaction not only of buying good English butter at a price not much, if any, higher than the mysterious blends of butters which are chiefly the product of bone-factories; but he would also feel a sense of security in eating butter produced under the strict supervision of his own State, instead of, as now, eating foreign butter which is often produced and stored under unwholesome and even filthy conditions.

HIS INHERITANCE.

CHAPTER V.—THE AWAKENING.

MRS GORDON began to look with some apprehension upon Bessie's absorption in her 'Jap,' as the young people of the neighbourhood teasingly called him; but it was with hesitation that she broached the subject of her disquietude to her husband.

'I have never seen Bessie so keen about helping any one before,' she said. 'I notice that she is always on the outlook to prevent him from making any little social mistake, and he does not seem to care to go anywhere or do anything without her. What should we do if he were to carry her off to Tokyo?'

'Carry her off to Tokyo!' exclaimed Mr Gordon. 'What are you thinking of? It is most extraordinary to me to see how you women let your imaginations run away with you. Pray, has the young man ever intimated to you that he has any such wish?'

'No,' admitted Mrs Gordon reluctantly, 'I can't say that he has; but surely, my dear, even you can see'——

'Can see!' interrupted Mr Gordon testily. 'Of

course I can see. I see what I have seen half-a-dozen times before. All the young fellows fall in love with Bessie, and what harm has it ever done either them or her? No one has ever succeeded in carrying her off as yet, and so why you should suddenly imagine that she is going to be captured and carried off to Tokyo I really can't conceive. I hope that you will put such a wild idea out of your head.'

The male parent is generally quite blind to the danger which the female parent so instinctively scents from afar. Mrs Gordon was silenced but not convinced. She was too wise a woman to say anything to Bessie; she knew that she would probably do harm rather than good, for the modern young woman is very reticent about the feelings of her heart.

The summer days went quickly. For Robert they were all too short. In the morning he studied with Mr Gordon, and the afternoons were filled up with tennis or boating. Everything seemed delightful; people were so kind, the scenery so beautiful, the weather perfection. Bessie once complained of the heat.

'Heat!' said Robert. 'You don't know what that word means. If you were in Tokyo now you would know what heat is; when you rise in the morning there is not a breath of air, and the thinnest cotton *kimono* feels like a flannel blanket about you. That is heat, but you can't call it heat when you have these Devonshire breezes blowing all about you. How is it that no one told me how heavenly the climate is here?'

Robert had never examined into his feelings. He vaguely imagined that it was England that filled him with such content; that this *joie de vivre* was because he had realised his fatherland and come into his own as an Englishman. With the end of the summer came his awakening.

It was in October that a former pupil of Mr Gordon's came to stay for a week at the vicarage. He and Bessie had been great friends, with that wholesome, frank friendship, based not upon sentiment but upon a similarity of tastes, which is possible to the young people of Anglo-Saxon blood. Bessie was not in the least in love with Mr Moore, but when he arrived she certainly transferred her attentions to him. Like every true woman, she was no doubt a bit of a coquette, and she felt anxious to see how Robert would look when he found that he was not the only young man she could boat with and talk to. It was then that Robert woke from his dream.

The garden was a mass of autumn flowers: the nasturtiums and geraniums were a blaze of colour; the mignonette filled the air with its fragrance; the leaves on the trees had turned to rich browns and yellows; but what pleasure did this beauty and fragrance give Robert if Bessie were sitting on the garden-seat laughing over old reminiscences with the newly arrived visitor? Or what pleasure was it to go in the boat in the afternoon when he was of the party? Mr Gordon, in his delightful innocence, hoped that the young men would become good friends; but Mrs Gordon felt troubled.

The intruder into Robert's paradise had not been there for two days before Robert realised the terrible position in which he stood. He was already a married man, but it had become an effort to him to think of Tokyo and his wife; Bessie absorbed all his thought, and it seemed to him as if life without her were a thing not worth having. The night after he had come to the realisation of the depths of his feeling he sat for hours with his arms folded and his head sunk on his breast, in that immovable way which is so impossible to a European but so natural to a Japanese. The next morning he announced that he was going to London on some business. Nothing of Robert's state of mind could be gathered from his face; had he been an Englishman there would almost inevitably have been some indication, either in the eye or in a compressed mouth, to tell of the storm within; but Robert had the Japanese faculty of dropping as it were a shutter in front of his feelings and showing an absolutely impassive face to the world.

Mr Gordon was mildly surprised at his pupil's sudden move, but Mrs Gordon was disturbed. She felt that the young man needed a friend to whom he could unburden himself, but where was such a friend to be found? Outside of their own family there was no one whom he could really call a friend. When Robert announced his intention of going to London, Bessie and Mr Moore had gone out to see some old friends in the village, and before they returned he had started. How little Bessie thought when she came in laughing and jesting with her companion that she was spending her last day of careless youth! Before another day had passed she was to enter into a new phase of being; sorrow and mystery were to penetrate into her hitherto sunny existence. The gay laugh that was the joy of the household was never quite the same again.

CHAPTER VI.—THE STRUGGLE.

On his arrival in London, Robert found a dense fog hanging over the city. It was his first experience of a fog, and the thick, yellow atmosphere filled him with horror; it seemed to him as if he had arrived in some infernal region, where men groped their way about like wandering ghosts. He went to the station hotel, and spent the evening in a chilly bedroom, going over and over in his mind the different courses which lay before him. It appeared to him that there were three lines of conduct for him to consider.

One was to put Bessie out of his life, and to resolve to go back to his wife when his time in England was over; but the very thought of doing so filled him with horror. Supposing that he had

the courage to leave Mr Gordon's house and break off all connection with Bessie, did that mean that he would forget her? No; he knew now that love could come as a great force, and so lay hold on a man's life that he could never again be the same as before. Could he go back to O Hatsu San and act the part of a husband to her? He said to himself that he would rather die than go back to that life which had once seemed so pleasant and natural. How could he live with O Hatsu San caring nothing for her, and conscious that in every fibre of his being he loved Bessie Gordon? He knew now that mysterious force about which the Japanese students were so sceptical, and it made him shudder to think how different were his present feelings from the feelings he had when he married O Hatsu San.

Another course which was open to him was quietly to divorce O Hatsu San, and then set himself to winning Bessie. The Gordons knew nothing of his wife, and they need know nothing of his divorce. That he could divorce her he felt certain; the divorce laws of Japan, though very different from what they were in olden days, still made divorce a very easy matter for any one who had set his heart on it.

Crouching over the fire in his gloomy bedroom, he lost himself in delightful dreams. He saw himself sailing over blue seas, with Bessie at the rudder—Bessie, whose presence always brought him such a sense of content. But after a time he started from his dreams with an overwhelming sense of the hopelessness of his position. A Japanese woman may pardon her husband's unfaithfulness—she may think it the supreme sign of her wifely devotion to do so; but he knew that if Bessie Gordon found out that he had divorced a faithful wife in order to win her he would be for ever despised in her eyes. He would also be despised in his own eyes, for he had been brought up as a Christian, and he knew how strict were the views of the Episcopal Church, to which he belonged, on the subject. He remembered the public excommunication of a man who had put away his wife without cause, and he realised that to put O Hatsu San away would not only fail to bring him nearer to winning Bessie, but would also be a sin against his own moral code.

Whichever of these two courses he pursued he foresaw nothing but misery and dishonour. The Japanese mind recognises but one way of escape from dishonour, so it was inevitable that Robert Lauder should turn for the solution of his difficulties to the third path which lay open before him.

Robert knew that the Christian faith forbade suicide, but generations of his Japanese ancestors had believed in it as the natural way of escape from a distasteful life, and his inherited instinct was stronger than his acquired creed. He had been educated in a Japanese school; he had been taught to look upon a calm and well-reasoned-out suicide as a proof of a highly trained mind. He knew that in olden times every youth of good birth was instructed how to make the cuts that ensured quick death: the one straight, deep cut across the body, and if strength remained a second cut across the throat. He thought of different Japanese heroes who had ended their lives in this way—some because of lost dignity, some for an imagined slight, and some on behalf of great causes.

Had Mr Elliot or any other sympathetic friend been at hand the poor young fellow might have been brought to see things in another light. He might have been brought to see that suicide is practically a running away, and therefore not the resort of the bravest. Japanese and Chinese of past ages may have looked upon it as a right and proper thing, but Christianity has always held that power of endurance is the real test of the strong man. The true hero does not commit suicide. But Robert Lauder had no one to reason with him. Youth always believes that its moods and feelings, loves and hates, will last for ever; and as Robert sat in his lonely room he pictured himself going through life in the same state of acute misery that he was in that night.

It was past midnight when he rose and sat down at a writing-table. He felt a longing to express himself, if only in writing, to some one, and it was to Mr Elliot that he poured out his misery.

In the cold gray of the morning he crept out, mentally and physically exhausted. He hailed a cab, and was driven to a shop where pistols were sold. The shopman looked doubtfully at the haggard young man; but his well-filled purse prevented questions. Within an hour of buying the pistol Robert Lauder had ceased to live.

Gentle little O Hatsu San, playing with her baby and talking to Hideo's mother of his return, little guessed that she was the burden which made his life insupportable, a burden assumed before he had sufficient knowledge of life to realise its capabilities. Had Robert been a purely Japanese man, even when living in England he might have remained faithful to his Japanese ideals of womanhood—gentle, obedient, smiling, the Japanese woman would have satisfied his nature; but Robert Lauder's inheritance of Anglo-Saxon blood had brought with it the possibility of passionate love, a love which came too late for happiness.

CHAPTER VII.—IN AFTER-DAYS.

AT the inquest held on the body of Robert Lauder a verdict of accidental death was passed. His bank-book and well-filled purse showed that he was in no money difficulties; Mr Gordon, who was summoned by telegram, could testify that the young man had seemed to be singularly free of any anxieties or worry; there was nothing among his papers that gave any clue; and it was supposed that he had not understood the handling of firearms, and hence the

accident. The letter that would have explained all was meanwhile lying in the post-office close by, waiting the departure of the mail. It was received a month later by Mr Elliot. A telegram announcing the bare fact of Robert Lauder's death had already been received, but it was not such a terrible shock to the Elliots as was the reading of the agonised letter which told of the struggle which led to the fatal step. Night after night poor Mr Elliot lay awake, going over and over the sad story, and wondering where the blame ought to be laid.

In his letter Robert Lauder made two requests: 'I beg you, dear sir, to become the guardian of my child; a second time this burden is laid upon you. I dare not look forward to his future. The only thought that comforts me is that he is almost purely Japanese; he does not inherit different race-instincts to the extent that I did. I also earnestly entreat that you will never let the Gordons know that I had a wife in Japan. I see now what a mistake my mother made when she arranged my early marriage. But she did it for the best; one cannot blame her. She did what was natural and right for a Japanese woman to do, and had I been a Japanese man I am confident that I should have been happy and content with her choice. Things that would have no particular attraction for a Japanese visiting England took hold of me because of my inherited English blood. It is my inheritance that has brought me into this sorrow; but let me live in the memory of the Gordons as they knew me. Heaven knows that I did not mean to injure them.'

This letter was not shown to Hideo's mother and wife. Mr Elliot, however, could not bring himself to destroy it, and it was kept locked by. One day he was arguing with a young Englishwoman who had announced her intention of marrying a Japanese.

'Well,' she said flippantly, 'I see that you do not approve; neither do some others; but, after all, if *I* choose to marry him and *he* chooses to marry me, that is all that matters; there is no one else really concerned in the affair.'

'Is there not?' said Mr Elliot grimly. 'I think there is; there may be some one much more concerned than either of you.'

'What do you mean?' she asked, open-eyed.

'Your children,' said Mr Elliot, 'who will inherit the natures of both of you. God knows that this world is a complicated and difficult enough place to live in; what right have you to make it more complicated and more difficult for them? Read this.' And, unlocking a drawer, Mr Elliot took out and laid in her hands the last letter of Robert Lauder.

THE END.

'BITS' OF EDINBURGH SIXTY YEARS AGO—AND AFTER.

By Major-General W. TWEEDIE, C.S.I.

IN the early forties of last century, when I was just beginning to apply my eyes to the peepholes of the world, or, as the nursery-maids said, 'turning into a cheeky brat,' it pleased my parents to transfer the family home from Aberdeen to Edinburgh. And thus it happened that one of my very early experiences was that of a sorely troubled night in the depths of a passenger-vessel plying between the Granite City (wherein, as is said, no Jew ever yet contrived to make a living) and Granton pier or Leith harbour. Oh, the rollings and the pitchings, the curmurrings and the convulsions, of that old-fashioned craft! Even now the thought of it makes one feel giddy. Oh, the overcrowding, and the smell of bilge-water, and the incessant swing of the doors in the so-called saloon in which the women and children occupied sofas! At first a hanging lamp served to make the darkness visible. All of a sudden, as I lay intently watching the swing of this not very luminous body, a thing that might have 'frightened the French' happened. A duck in the last stage of desperation, and screeching like a demented parrot, rushed fluttering and flopping into the cabin, with the skipper's cook, a massive and half-naked negro, in hot pursuit. A proper hubbub followed, in the course of which either the man or the bird, coming in contact with the lamp, extinguished it. And then some of the ladies, feeling anything but sure of the gentleman from Ethiopia, raised the cry of 'Murder!' How fast and firm are the impressions received in childhood! After that night's experience, no pictorial illustrations were ever needed in my case to suggest the form and figure of the Evil One. Among the 'bits' of old Edinburgh in waiting on the pier-head, in the form of hackney-coaches to take the passengers over the two or three miles of road which separate 'Auld Reekie' from her ocean fringes, there was much variety of pattern. Of those who know the modern Edinburgh thoroughfares, I wonder how many, or how few, remember the 'minibus,' so called to distinguish it from the omnibus, which it closely resembled, except in being only half the size, hung high on two wheels, and taken by one horse. Much in evidence, also, was the capacious family four-wheeler, with one horse or a pair, according to the occasion—the 'noddy' of Maria Edgeworth's Edinburgh tales, and a veritable 'womb of time,' out of which, when once it began, like the English 'sow' at the siege of Dunbar,* to

* See this story, told in Scott's best manner, in *Tales of a Grandfather*, Chap. xiv.

turn out its contents, an amazing number of inside passengers would issue. With one of these convenient receptacles, built on lines as antiquated as those of Noah's Ark, a certain Finlay, whose own proper cab-stance was many miles distant in the 'Old Town,' stood expectant—a man of sterling, honest metal, with whom, and with his lumbering noddy and its pair of light blood-mares (one of them the winner of a plate at Musselburgh), a lasting friendship was that day established. To the same gaucy old fellow it was reserved, some years later, to give an example of what a grand day's work could be accomplished by the Edinburgh street-cab of our grandfathers' period. By that time five children had to be thought of, the eldest being fully ten years; and one summer, shortly before the opening of the Caledonian Railway, it was agreed upon to spend the vacation at Moffat. Fifty-one miles of hard high-road run, as everybody knows, between the east end of Princes Street, Edinburgh, and the townhead and old toll-bar of Moffat; and this piece of transport was readily undertaken by Finlay and his pair of thoroughbreds. Ah me! what an impressive hero is every Jehu or 'driver' for every healthy-minded youngster! I think I see the ancient of days as he appeared at the comfortable hour of seven on the morning of the journey, his rounded shoulders bent well forward over the rumps of his cattle, and his eyes twinkling and his face shining like a winter apple under the shadow of his shaggy white beaver. I do not recollect a moment's trouble over preliminaries. There was no rumble; but father, mother, and five children, with probably a domestic, found places somewhere. 'Crack went the whip, round went the wheels,' as Cowper says; and before the autumn morning had lost its nippy feeling Romanno Bridge received us. An hour and a half's fishing in the Broughton Burn while the mares were being baited yielded a trout which turned the scale at half-a-pound in the inn kitchen, and in its first ambrosial curdiness would have done no discredit to a Roman banquet of the Augustan epoch. The next halt was at the Crook Inn, a great resort of anglers—a kind of 'Tibbie Shiels' indeed, though never in this life can any one hope to see a second 'Tibbie's.' Here the Tweed, as yet unstained by too much earthy matter, charmed the ear by its soft motion and music; but in the golden noontide radiance only the parr and the minnows were stirring. And after that came Moffat, what time the wreaths of fragrant peat-smoke rising out of the cottage chimneys into the clear blue ether showed the porridge-pot to be boiling. The following day the mares rested in the stables of the Annandale Arms, then presided over by the Cranstoun family; the head of which, a buxom, well-favoured widow—when, with her daughter 'Miss Mary' at her elbow, she took post in the lobby to speed the parting or receive the coming guest—looked every inch the gracious, beaming landlady and hostess of an older period. By the evening of the third day Finlay was back on the College Street stance, Edinburgh.

By way of first shelter in what Scott in one of his happy outbursts called his 'own romantic town,' 'apartments' had been secured in Castle Street; the fine old family houses of which had even then been much cut up into 'flats,' entered from a 'common stair.' Opposite to our windows was Scott's 'poor 39,' where some of his grandest literary work was done. At that time the great master had been barely ten years in his grave at Dryburgh. As yet no tablet marked the 'convenient cabin' which, when his misfortunes were gathering about him like vultures round a wounded lion, he had yielded up to his business creditors. But happily nothing of the kind was needed.

At Whitsunday term a house was taken in the south-eastern angle of George, or George's, Square;* so that all the 'bits' appearing in the sequel will be found connected with that fine old residential quarter, even then thrown into shadow by the Crescents and Terraces, Rows and Places, of the 'New Town,' but continuing, nevertheless, as it does to this day indeed, with all its air of faded greatness and comparative isolation, to present most of the substantial advantages which, at the time when the city on the ridge first began to turn impatient of its pristine boundaries, had attracted to its smaller and greater mansions the *élite* of the 'auld Scottish nation.' With all this, however, I cannot at the moment remember more than one house with a claim to be called historic, and that was No. 5, the town mansion of the Camperdown family; to whose distinguished founder belonged the glory of bringing in the Trafalgar epoch, when, on the 11th of October 1787, he administered the soundest drubbing to a Dutch fleet, under Vice-Admiral De Winter, off the islands of Egmont and Camperdown. Interesting and even classic houses the Square could boast of; such as No. 25, the home of Scott's parents, in which the lame boy, though born in another part of the same district, collected his first closetful of books and knick-knacks; but Scott himself would have been the last to mix up associations of this sort with those that cluster round heroic actions—witness the tremors which he, the crowned monarch of the realm of romance and poesy, always experienced in the presence of the illustrious warrior whose victory at Waterloo settled the fate of Europe. Adam, first Lord Viscount Duncan of Camperdown, having died in 1804, the George's Square house, when I came to know it, was held on lease by a schoolmaster, who for a number of years turned

* Scott, in an autobiographical fragment (1808), published (1837) in the *Life and Memoirs*, &c., by Lockhart (vol. i. pp. 1–60), writes 'George's Square,' and Lockhart follows suit. When last in Edinburgh I noticed 'George' and 'George's' Square inscribed side by side on the Square corners; and in a paper relating, as this does, to the olden time, the older form seems the more appropriate.

it to good account as the 'Southern Academy,' a day-school for boys only, and, in fact, a kind of compromise between maternal affection and the dire necessity of sending 'the boys' *somewhere;* the 'High School' having by that time been transplanted from its place in the 'Old Town' to the remoter situation on the Calton Hill, where it still bears witness to its architect's genius and sense of beauty. Among the Southern Academy undermasters—to each of whom in his own department was committed the power of pit and gallows, taws and cane—there were several capital teachers, notably a Mr Redpath, on whom the boys had conferred an unquotable nickname, designed to indicate not so much his excellence as an expounder of Latin authors as the snellness and uncertainty of his temper. According to the set of 'Red ——'s' features at the moment of his entering his class-room in the morning the fortunes of the day within his little kingdom were predicable. One thing he effectually accomplished, and that was the final suppression of certain rude pieces of horse-play which broke out occasionally between the tailor-dressed boys of the 'Academy' and the hardy loons in nondescript garments, whose homes lay thick in the adjoining districts. Scott's references to these street skirmishes, or 'bickers,' must be familiar to many. 'Red ——,' whose information was excellent, picked out a set of culprits, and before ever a piece of raw beef could be applied to their closed-up optics, proceeded to belabour them soundly. Ah, well! rose-water surgery never yet cured a deeply seated ulcer. Instead of fronting, like all the other houses in the Square, towards the central gardens, No. 5 had been set down endways, with the principal entrance opening on an ample courtyard. This space, no longer needed for the sedans of 'ladies of quality' on rout-nights, formed in my day the 'Academy' playground. The reason of Camperdown House being so much dwelt upon is that no trace of it in its original form is now remaining. Mansion and quadrangle have long ago been absorbed together into a massive edifice connected with a city foundation for the education of young women. The well-detached stables, having their open-air riding-school in what was then 'Park Place,' have in the same manner been included in the site of new University buildings.

And now it is time to pass from the George's Square houses to their occupants. *Place aux dames.* In the south-western angle of the Square, in one of eight or ten distinguished-looking houses, there lived the widow of the second and last Sir Walter Scott of Abbotsford, the 'very sweet and pretty Mistress Anne Page' of her fond father-in-law's correspondence.* Old associations do not, however, yield up the ground all at once to new ones. One of Lady Scott's near neighbours was a warrior fresh from Lord Gough's Indian battles; and what his thoughts always seemed to run on in connection with the house in question was not the Waverley Novels, but the oceans of claret which at a much earlier period he had seen going over in its dining-room—realising Christopher North's ideal, when Hogg, on a night of thirst unquenchable, called out to 'Tibbie' to 'bring ben the loch'—that is, St Mary's—to be made into toddy!† In our part of the Square, even in the forties, the inexorable 'flat' had fastened on the corner houses; and in the small and compact dwellings thus provided there was to be found a considerable sprinkling of antique Scottish dowagers and spinsters—'rags of gentility,' as one of the pew-openers in the parish kirk, a certain Mrs Ambrose, called them, from their connection generally with the laird class. In No. 46 there lived and died—the shortest-lived reaching seventy-eight years and the last survivor ninety-five years—no fewer than six unmarried sisters belonging to this category;‡ the *dulce decus et presidium* of nephews and nieces, grand-nephews and grand-nieces, innumerable, and the delight of a circle as wide at least as Scotland. Of a different but equally interesting type—more French, indeed, than Scottish—was a dame of ancient lineage who lived a few doors off, bearing a name not unknown to Froissart, but standing alone in the Edinburgh Directory—a name which the boys of the vicinity, being as wanting in reverence as the sparrows, and suspecting or affecting to suspect the owner of it of practising in secret the arts of witchcraft, shortened unceremoniously into 'Strunkie.' And was there not close by one of the Wauchopes of Niddrie-Marischal, grand-aunt, presumably, of the hero who so recently died for his country in South Africa? I do not know how the pleasure-grounds in the centre of the Square were administered; but if through a committee, then must Miss Wauchope have been president, members, and secretary rolled into one, for she ruled that dour man the gardener as if she had been his grandmother, and, moving about in short skirts and the stoutest of footgear, shook her spiked staff at evil-doers. Most piquant of all, perhaps, were the Misses —— of ——, whose house was No —. To hear these patrician ladies using at their tea-table, of course without a trace of 'vulgarity,' that grand Doric speech and accent which is imbued and seasoned with all our strongest characteristics and all our tenderest associations was enough to make any one imagine that the hand of Time's clock had travelled backward into the eighteenth or last distinctively Scottish century. I am not even sure that when they would condemn a thing they did not damn or 'daumn' it, without a thought of harm. Peace be with them! They

* *Memoirs of the Life of Sir W. Scott*, by Lockhart, vol. vi. p. 3.

are gone, and we shall never see the like of them. The last of these Scottish ladies of the olden time who can here be mentioned lived in No. 15—the house in which there died so far back as 1786 that Lady Glenorchy whose zeal for erecting and endowing churches made her in her way the Scottish Lady Huntingdon.

A story is told of an exalted personage who, on meeting his sartorial adviser at a *fête champêtre* the invitations to which were unusually numerous, asked him what he thought of it, and on receiving for answer, 'Rather mixed, your Royal Highness,' was graciously pleased to make the observation, 'Surely, Mr ——, you did not expect them all to be tailors!' And in the same manner it was not possible even in the forties for all the George's Square householders to be of the 'upper,' or even of the uppish, classes. A very few were 'county gentlemen' who still retained the paternal town-house, and occupied it in the short Edinburgh 'season.' There was also a goodly number of veterans who had had their innings—notably Scott's devoted aide-de-camp, Sir Adam Fergusson—and who were waiting pathetically for the boatman whose call there is no resisting. Here and there a merchant lived in the house in which his father, and perhaps his grandfather, had lived before him. One such in particular, without being a 'merchant prince' in the modern acceptation, admirably continued the tradition connecting so many well-established Scottish families with commerce in its shopkeeping form. This fine survivor had his shop in the High Street, under the shadow of St Giles'. One of the staples in which he dealt was West of England broadcloths; and among the older citizens it was still the custom, when there was need for a new suit, to go to a shop like his, buy a piece off the web, have a tailor fetched out of an adjoining 'land'* or 'garret,' and entrust him with the material, all as described in Galt's novels, and later by 'Delta'† in *Mansie Waugh*. He who had seen Mr Thomas Clapperton—for why keep back so good a name?—step out of his house in George's Square on a Saturday afternoon, equipped for a ride into the country, the while that his hack was being led up and down before the door, had seen a type of 'merchant' recalling George Heriot and the reign of the 'Scottish Solomon.' I wonder how many future cavalry officers and mighty hunters owed their very first taste of horsemanship to that sleek brown gelding of his, when lifted for a few golden minutes into the saddle by the kindly old gentleman. After all, however, it was the ministers, the Writers to H.M.'s Signet—that is, attorneys—and the doctors who at the time of which I am speaking filled up the George's Square houses. One of our Sunday relaxations as children, I remember, was in the winter months to leave the window-blind undrawn so that we might see the minister of the Tolbooth parish brought to his door in proper style by a certain Lady Honeyman, the horses in whose great chariot were loaded with silver-mounted harness resplendent in the lamplight, and were put to *à la* postillion. As for the lawyers, some of them were lairds as well, and 'wherefore no?' Land, they tell us, is 'proud property'—that is, so many burdens are laid on it that but little is left to the proprietor beyond the pride of ownership. Nevertheless, it is not unnoticed that every Scot makes for it the moment he gets his head above water; and it would be poor fun for a 'man of business' to deal in land estates all his lifetime without ever a chance occurring of a portion passing into his own possession, always, of course, through the recognised methods of 'conveyancing.' The 'doctors,' again, were all of the general practitioner, family physician, and more or less gold-headed cane school. Unknown to their philosophy was the present-day system under which a man who has 'specialised' in surgery, if a drug be so much as mentioned, says that he thinks he heard of it in his student days, but that if a prescription be wanted, a visit (and a fee) to his next-door neighbour will be necessary. The Edinburgh 'Joe Mantons' of the forties were all of them double-barrelled fellows. When they chanced to miss with their pills and potions they always had their lancets and their cupping-glasses, not to mention heavier artillery, to fall back on. The only very eminent member of the Faculty who lived in George's Square, so far as my memory serves, was that John Goodsir who, as a savant and man of science, helped in his day and generation to prepare the way for Darwin and for Huxley; but as holder of the Anatomy chair in the University, Goodsir saw no patients save those whose ills and pains were ended. By the *canaille* of the neighbourhood the man whose house bristled with gruesome things that ought to have been buried was regarded as a kind of ghoul; and one day a mob of gamins sent a volley of missiles through his windows. The Anatomy Act, opening up lawful channels for the supply of dead bodies to dissecting-rooms, was as yet comparatively recent. Nursery-maids still frightened children with the story of the West Port murders. And when it was observed that the Professor of Anatomy, in his zeal for every branch of Natural History, kept a pair of eagles in an outhouse, it passed from mouth to mouth that the birds were fed on relics of mortality fetched from the College dissecting-rooms. Oh, swinish multitude, how consistently through the ages hast thou stoned the prophets and obstructed the avenues of knowledge!

I hardly like to lay down the pen without a word of reference to the canine population. For one house-dog that is domiciled in the Square nowadays I should not wonder if five could have been counted in the forties. The appearance in 1815 of *Guy*

* Mr Burton's description of these old Edinburgh 'lands' is: 'Edifices, some of them ten or twelve storeys high, in which the citizens of Edinburgh made staircases supply the place of streets, and erected perpendicular thoroughfares.'

† David Macbeth Moir, Musselburgh (1798-1851), physician, writer of graceful verses, humorist.

Mannering—second in point of date of the 'Waverley' series—had caused a perfect furor for the 'Dandie Dinmont' or 'Pepper and Mustard' breed of terriers. The neighbours fell into the habit of calling every Dandie after its owner, as 'Dandie Fergusson,' 'Dandie Leburn,' and so on, just as in great houses servants address each other by their masters' titles. Now, the curious thing here is that although there existed, of course, a general resemblance among the George's Square 'Dandies,' nobody could have said of any two of them that they hailed from the same country-side or owned in any strict sense a common origin.

Some of the George's Square 'Dandies' of long ago suggested to one lion-apes, with the mane well developed; others there were which, being more poodle than terrier, were fairly open to the sarcasms of 'Wullie' Carlyle—a Roxburgh man—of the Lothian Road canine repository, according to whom there 'wasna a drap o' Dandie blood in their whole composeetion!' But not to waste words on mere 'kennawhats' and nondescripts, was not the presumption reasonable that at least Sir Adam Fergusson's 'handwaled' and favourite 'Dandie' was an authentic chip of the old block left by Davidson only about two canine generations previously? But was he? Of course there is no one living now who can answer this question. During several years I constantly saw the little fellow not only in the flesh, as he followed his truly venerable master in his walks under the trees of the 'Meadows,' where so many of the Scottish *illuminati* had walked in their day before him, but also as introduced into a picture of the George's Square ingle-neuk, with Sir Adam and Lady Fergusson seated in it, which was shown in the Royal Scottish Academy's Exhibition; but it is merely for the sake of drawing on a little further 'Dandie' talk that he is here mentioned. Come up, then, Mr 'Dandie,' and be looked at! First of all, you are plainly on the small side, weighing but twelve pounds or thereabouts, and therefore just the size for the 'sports' described in Chapters xxv. and xxvi. of *Guy Mannering*. And then your coat, resembling in colour that of the stuffed lion in Dickson the gunmaker's shop in Princes Street, is spare and hard and birsy, without any of that 'pily' or 'pencilled' character which 'fanciers' prize so highly; though what the good of it is to a terrier when at work in a cairn or a fox-earth is another matter. In point of general aspect, who would put you down as 'sib' to the 'Dandies' of which it is written, in a letter quoted by Dr John Brown in one of his charming essays in *Horæ Subsecivæ*,* that 'among common dogs they were something like the Black Dwarf among men, long-bodied animals, with strong, short legs, wiry-haired, and at the first look not unlike a low four-footed stool such as I have seen in homes in the south of Scotland forty years ago.' No more do you resemble a four-footed stool than any other piece of furniture, although I have seen very long ago, in the cottage of Paul Scott of Jedburgh, 'Dandies' to which the foregoing description certainly was applicable. On the contrary, you are rough and ready, upstanding, workman-like, with only a moderately long body and the step of a Highland piper. Just as little, it must be added, do you conform to the model of any of the fashionably bred 'Dandies' whose portraits figure in 'Stonehenge's' books on the dog, and in Mr Charles Cook's monograph on the 'Dandie Dinmont' terrier; your ears, for one thing, being neither 'large' nor 'pendulous,' but erect, or erectile, at the base, with small and delicate tips that fall over. Last, but not least, there is not a feature of you that suggests the dachshund or any other 'hound' whatsoever. From the end of the snout to the tip of the tail you are full of truest terrier 'character.' It is rather remarkable that in the course of half a century, while innumerable 'Dandies,' ever so much higher in the scale of breeding than you are have passed before me, I have never chanced to come across one that exactly recalled your image. And now, little friend, you have leave to go back again to the shadowy realm.

'Tis a strange world' we live in, and of this the cynic will perhaps see an indication in the circumstance of so great a body of literature—much of it controversial—having gathered round the 'Auld Pepper and Auld Mustard, and Young Pepper and Young Mustard, and Little Pepper and Little Mustard' of a novel.† This is a matter of opinion. But unmistakable at least are the evidences thus afforded of the deep and lasting impressions created by every jot and tittle of Scott's work and writings; while at the same time the common inclination to try to see farther into the millstone than the nature of a millstone will permit is perhaps illustrated.

* The writer of the letter quoted was Mr Robert White, Newcastle-on-Tyne, in his day a noted Border antiquary and virtuoso; and it was at 'Ned' Dunn's of the Whitelee, at the head of Redesdale, that he noticed the dogs mentioned by him. *Vide* 'Our Dogs,' in one of the several series of *Horæ Subsecivæ*, 1862 edition, at p. 206.

THE FARÖE ISLANDS.

THE CRADLE OF SEA-KINGS.

By A. Clarke Little.

HE who would for a while flee the madding crowd and seek in a remote corner of Europe that change of scene and rest which the annual Continental scramble knows not might with advantage visit the Faröe Islands. Though remote and little heard of nowadays, these islands have in the past played an important part in the world's history. Not inaptly have they been described as 'the hinge of the door which opened America to the world.'

The permanent settlement of the islands dates from the year 874, when the Viking Floke, resenting the tyrannous rule of King Harald, who aimed at a united Norway in which family feuds should cease, sailed west. In such time as wind and weather permitted, Floke arrived at the nameless group of islands, of which he had probably heard, and took possession. He was not the discoverer of the islands. Flocks of sheep running wild pointed to a pirate of an earlier date who had thus provided for a rainy day. From these sheep the islands took their name—*faer* being old Norse for sheep, and *öe* standing for island.

To judge from the *sagas* sung in the islands to this day, and the many silver-mounted skulls still treasured as priceless heirlooms, the islands were run on the forbidden lines sacred to Norse chivalry. Malcontents forsook their native fjords, harassed with restrictive legislation, and sought the freedom of the Faröes.

Amongst the disaffected was one Nadoddr, who was so far blown out of his course in attempting to reach the Faröes that he discovered Iceland. His report of the country was such that by the twelfth century it had a population of one hundred thousand—descendants of Norse sea-kings. From Iceland, in the year 980, the island of Jan Mayen was discovered.

Erick the Red, under sentence of banishment from Iceland, determined to make the newly discovered island his home. Blown from his course, he discovered land to the west, which, because of its barren, inhospitable aspect, he named Greenland. Returning to Iceland, Erick led an expedition of twenty-five ships to take possession of the land which he claimed. Here, for the first time since wandering from their native fjords, the Norsemen encountered armed opposition. East and West met in conflict. The Esquimaux disputed his possession. In spite of Esquimaux, and a climate which must surely have become more rigorous within historic times, the Greenland colonies flourished for four centuries, and a regular trade was established with Norway, which continued till the year 1406, when for some reason—probably an attempt to bring them under Swedish rule—the Greenland colonies were abandoned.

In the year 1001 Bjorne Herjulfsson, an Icelander, fired with glowing accounts of Greenland prosperity, set out for the land of promise. Sharing the fate, or good fortune, of many an early voyager, he too was blown from his course and became the discoverer of America. From his description of the country south-west of Greenland, it is supposed that he landed at the part now called Nova Scotia.

The fact of his having failed to reach the land for which he started had more weight with Herjulfsson than the discovery of the New World five hundred years before Columbus. The story of his discovery, told on his arrival in Greenland, sent other adventurers still farther west. Leifr Erickson, with an expedition of thirty-five men, landed on the coast of Labrador. Leaving that inhospitable coast, he sailed south and discovered an island, probably Newfoundland. This he named Vinland, because of the small berries resembling grapes which grew there. Erickson's description, it has been urged, might apply equally to Nova Scotia. One observation, however, made by its discoverer should serve to identify Newfoundland with Vinland. In his account of the island, still current amongst Faröean *sagas*, he gave the length of the shortest day at the southernmost point reached at eight hours. The latitude of Newfoundland—fifty degrees north approximately, which is about the same as that of the south coast of England—enjoys a similar amount of sunshine on the shortest day of the year. Nova Scotia—which, by the way, is not an island—lies four or five degrees farther south, and has a shortest day of nine hours.

In the year 1002 Thorvald Erickson, son of Leifr, started to explore the interior of Vinland, but was killed by *skraelings*—a word which in the Norse language stands for little men—probably Esquimaux. The inhabitants of Greenland are so named in the *saga*.

In 1007 Thorfinn Karlsefne is said to have founded a colony in the New World, and traded with the natives for furs. The following translation of a Norse inscription found upon a rock at Dighton, Massachusetts (U.S.A.), apparently confirms the hearsay of the ancient *saga*: 'With one hundred and fifty-one Norsemen, Thorfinn took possession of this country.'

Why and at what period the Vinland colonies, which appear to have stretched as far south as the neighbourhood of Boston, were abandoned is uncertain. Trade between them and Norway *viâ* Greenland, Iceland, and the Faröe Islands continued till well into the fifteenth century.

But in our glimpse of the New World previous

to its official discovery we are losing sight of the hinge on which the door turned which threw it open to the Old World. In his voyage to the Faröe Islands in 1477, Christopher Columbus collected so much indisputable evidence of the existence of a western continent that he prevailed upon the Portuguese merchant-adventurers of his day to fit out the expedition with which he won the credit of discovering a New World.

To visit the sons of the sea-kings who knew America whilst Saxons ruled in England we must to Leith about the middle of any summer month. There we board the Danish steamer, just in from Copenhagen, *en route* for Iceland. Early next morning moorings are cast off and the three days' voyage to the Faröes begins.

The green coast of Fifeshire on the one hand, the fair city of Edinburgh still sleeping under the shadow of Arthur's Seat on the other, and the dancing waters of the Firth of Forth sparkling under the early morning sun will more than compensate for a short night's rest, if indeed the overhead commotion of getting under way has not already curtailed it.

Leaving May Island astern, we take a northward course past the Bell Rock at the mouth of the Tay.

As evening approaches, with Buchan Ness astern, the full force of the Atlantic, as it pours through the narrow Pentland Firth, varies the monotony of a so far uneventful voyage.

Fair Island, midway between the Orkneys and the Shetlands, is passed in the night, and for two days we speed north, the centre of a heaving circle of green sea.

Late in the evening of our third day out, shouts of 'Land!' turn our eyes northward. Far away, bathed in the golden light of the sinking sun, midway between them, rise two mountain peaks. These are the mountains of Suderö, the southernmost of the Faröes. The smaller and uninhabited island of Munken, which was farther south, disappeared in a storm on 7th November 1885.

There are twenty-six islands in the group, which constitutes a flourishing Danish colony. Half of these support a population of fourteen thousand; the other half, uninhabited, grass-topped rocks, are mostly turned to profitable account as grazing ground for sheep.

Strange and full of wonder is the scene which meets our eye as we step on deck next morning. Our ship no longer ploughs the lonely deep, but lies at anchor in a large, landlocked bay, girt with rugged hills and as calm as a mill-pond. Time seems to have gone back a thousand years, and we gaze upon a living picture of the past, the only modern thing about it our steamer. The small boats that swarm about us are built upon the lines of the Viking's ship, with high-pointed stem and stern. The rowers sit two on a seat, their clumsy, narrow-bladed oars lashed to the side with thongs of whale-hide. These men remind us forcibly of the ancient Norseman as he has been depicted—ruddy, with curly, flaxen hair and beard. The coat of rough homespun, sometimes blue but more often brown, which is the natural colour of Faröe wool; breeches fastened at the knee with brass buttons; a red-and-blue striped cap, the top of which flops on one side; and the fishing-knife invariably worn at the waist, give to the islander a jaunty, piratical appearance much at variance with his peaceful occupation and gentle manner.

The islander has a dialect of his own, in which are many words found in the English language; but it is essentially a modification of the language of the ancient Norseman. He understands English, and speaks it too. Anxious to do the honours of his island, he will offer to row you ashore in his semi-waterlogged and fishy craft.

The village which straggles around the bay of Suderö consists of some fifty houses. The best of these are of wood, imported—for not a tree grows on the islands from which a plank can be cut—and built upon small piles of stones. The smaller houses are mere one-roomed turf-cabins, innocent of chimney or window. The smoke from the peat-fire that burns in a corner of the sunken earth-floor escapes through the door or remains inside. The sloping pine-bark roofs of the better houses are turfed to prevent their blowing away, and on them the native sheep may often be seen grazing.

Evidence of the fishing industry, the most important in the islands, is on all sides. The fish, mostly cod are taken with the hand-line on the adjacent banks. Payment is by weight and size: two öre per pound being paid for small fish (under eighteen inches in length), and three öre for large fish (over eighteen inches). One hundred öre equal one krone, which is worth one shilling and three-halfpence. When possible the fish are sent south alive, in steamers fitted with tanks through which the sea washes. As more frequently happens, they are cleaned and salted. This done, drying follows. Flat stones are collected, on which the fish are exposed and carefully turned from side to side by women and children. At night, or in wet weather, they are stacked in large heaps and covered with matting. Under favourable conditions the drying is complete in a fortnight. During the summer months 'Good weather for the fish' is as common a salutation in the Faröes as 'Good weather for the hay' in rural England, and means the same thing.

Other Faröe industries are sheep and eider-duck rearing, whale-hunting, and feather-collecting. The small sheep that has flourished on the grass-grown islands for over a thousand years produces a fine wool of excellent quality. From some of the islands the wool is brown, and from others pure white. No Faröe woman is ever seen without her knitting-needles, though she does not always get credit for her industry. Many of the shawls, gloves, stockings, and under-garments which she is invariably engaged upon, whether she goes a-milking or turf-digging,

are marketed as Icelandic because of the fineness of the wool.

The hills which encircle Suderö to a height of some fifteen hundred feet have frequent outcrops of bituminous coal, fourteen million tons of which is estimated to be in the Faröe Islands. The coal is, however, of such inferior quality that it is not worked.

To a visitor leaving Suderö and steaming north, the rock-bound coasts of Lille Dimon, Store Dimon, and Sandö yield magnificent scenery. The smaller of these islands, Lille Dimon (Little Diamond), is inhabited by the members of one family only. Access to the island is by a rope-ladder.

Strömö, the largest of the islands, about twenty miles long and eight wide, is faced by Nolsö and Österö. Through the narrow, winding channel between these islands the pent-in waters of the ocean currents from the south rush with great force. Hence the name of the island on which stands Thorshavn, the capital of the Faröes. The coast scenery of these islands is particularly fine: black basaltic cliffs, wreathed with pounding billows at the base, thatched with the greenest grass in the world, and intersected by fertile valleys. Indeed, the same may be said of all the islands, which are elongated in form, lying north-west and south-east. The *ströms* which intersect them are a final effort of a continuation of the Gulf Stream, which, emerging at the northern end of the islands, mingles with the colder waters of the sub-arctic Atlantic and loses its identity.

To the warm waters of the Gulf Stream the Faröes owe their prosperity. Though they lie around the sixty-second parallel of north latitude, considerably farther north than St Petersburg, the temperature of the islands is moderately warm all the year round. Frost is seldom experienced even in winter, and snow does not lie. The mean variation of summer and winter temperature is fourteen degrees Fahrenheit. Rainfall is moderate, and the one disadvantage to a climate which is the most equable of any in the world is its liability to fog at all seasons. This is, however, light, and not to be compared with the variety known to England or any portion of northern Europe.

Though the islands are destitute of timber, afforestation has recently been attempted, with signs of success. Amongst the trees which have taken most kindly to the soil of the more sheltered valleys is the silver birch. The deficiency in native timber is to a certain extent made good by the ocean currents, which cast ashore whole trees and huge balks borne from more favoured latitudes south of the equator.

Thorshavn, the capital of the Faröes, is pleasantly situated at the head of a sheltered bay of the same name in Strömö, the largest of the islands, and contains a population of about one thousand five hundred. There is one hotel in Thorshavn, and accommodation elsewhere may be found by applying to the postmaster or to one of the many consuls by whom every country in Europe is represented. Here, as everywhere else in the islands, fish is the first object to attract attention. Acres of it lie in every spot where a drying-yard can be laid out. On lines, like washing, it hangs, and to the walls of the houses it is nailed safe from the reach of sorrowful and tailless cats that swarm in the town. The streets of Thorshavn are narrow, winding, and unpaved. The houses, invariably built of wood on stone foundations, are imported in sections from Denmark.

Show-places in the Faröes are few. An obelisk on the outskirts of Thorshavn, bearing the date 1874, commemorates a visit from the King of Denmark, which was the occasion of inaugurating a new constitution, of which Free Trade was the greatest blessing. Previous to the new constitution the entire product of the islands was consigned, under heavy penalty, to one firm in Hamburg.

Some primitive and homely laws still hold good in the islands. An annual tax, which must be paid at the capital during the month of July, must be accompanied, as far as each male adult is concerned, by the bills of two crows. The crow which infests the islands is a scourge to the farmer during the lambing season. A man unable to pay his tax may give the equivalent in labour. The construction of one yard of public road represents an abatement of one krone. Two crows' bills over and above the two annually demanded by law are rewarded by two öre. Every islander carries a gun, and every store is stocked with them—old double-barrelled muzzle-loaders fired by percussion-cap.

By way of other sport, most of the streams yield trout, and hares and some birds may be shot after 15th August, when the eider duck has finished laying. At other seasons, to discharge a gun on shore, excepting at a crow, is criminal.

A fortress which commands the entrance to Thorshavn Bay is to-day garrisoned by a score of Danish sailors, who conduct meteorological observations, and in the rare event of a disturbance act as guardians of the peace. The fort is one of the few historic relics in the Faröes. It was built in the latter end of the sixteenth century by Magnus Heinessen, a priest sent by King Christian III. of Denmark to administer to the spiritual wants of an outlying portion of his subjects. Heinessen found the temporal wants of his defenceless flock, scourged by the filibusters of all nations, more urgent than their spiritual. He equipped a fleet and swept the adjacent seas of their unwelcome visitors. To protect the bay from unexpected raids he built the fort and mounted guns. But, like many a patriot, Heinessen met with an ignominious and undeserved fate. The fame of the fighting parson spread to distant Europe, and as a reward for his services his king placed a man-of-war at his disposal. With his war-vessel Heinessen captured an English ship laden with freshly gathered loot from the Faröes. The English owners of the vessel declared that the cargo had been purchased in the Shetlands,

and that its capture by Heinessen was an act of piracy. The matter was referred to the Danish Government, and the warrior-priest was sentenced to death. His execution took place in 1509, and not till some years afterwards was his reputation vindicated. The judge who passed sentence was punished, and the fort to-day immortalises the hero of Faröean fishermen.

Communication between island and island is by small boat, rowing or sailing, provided by the postmaster at every village. Kirkjubae, on the west coast of Strömö, may be reached by land—a pleasant journey of eight miles across the fells—on foot or by pony. There are no wheeled vehicles in Faröe. Kirkjubae is a good specimen of a Faröe farm, standing on a green slip of land by the sea, and backed by precipitous mountains. In one of these may be seen a cave in which was born a child who afterwards became king of Norway. Between the mountains and the farmhouse are the stone wall of what was to have been a Roman Catholic cathedral. With the Reformation work was suspended, and the half-built cathedral stands to-day as it was left at the end of the sixteenth century. The house, built in the usual Faröe style, is still older and quaintly picturesque. In the basement may be seen the oubliette into which convicts engaged in building the cathedral by day were lowered with a rope at night.

Those who shrink from a sea-passage in an open boat to Eider may here inspect an island dedicated to the highly prized bird of that name. About the swampy island are wooden pens in which the duck, speckled brown-and-black like our wild duck, lays, after lining its nest with down plucked from its breast. Down and eggs are removed. The duck plucks more down and lays more eggs, which are continually removed till late in the season, when two eggs are left for hatching.

Birds'-nesting of a more exciting order may be witnessed on the more remote islands of Fuglö, the easternmost of the group, and Vaagö, to the west. Here the islander sits astride a piece of wood and is lowered over the cliff by a rope. In mid-air, hundreds of feet above the sea, he dangles and swings from ledge to ledge, beating off the furious attacks of the sea-birds with a stick. The feathers and skins of the birds, which are of many varieties, mostly gulls and auks, have a small market value, and their eggs supplement his monotonous fish-diet.

Kalsö, Kunö, and Bordö, islands to the north, with narrow fjords banked by precipitous cliffs thousands of feet high, present the grandest coast scenery.

Klaksvig, on Bordö, is the most important village in these parts. Bordönaes, a peak about two thousand feet in height, which dominates the village, is well worth the ascent. From the summit, which is flat like Helvellyn, and falls in one sheer precipice to the sea on the eastern side, a magnificent panoramic view of the islands may be obtained on a clear day. Not the least interesting feature of the scene is the contrast between the rushing, white-topped, brown waters of the many *ströms* which divide island from island, and the placid green of the limitless sea beyond.

He who has a fancy for deep-sea fishing may from any point of the islands gratify that fancy free of cost. Any fisherman will be glad of his company for a share of his spoil and services at an oar. Rarely indeed is the voracious cod of the Faröe banks off his feed. Half-a-dozen hand-lines, with twenty to sixty fathoms out, will soon make as heavy a boatload as the keenest sportsman will care to row home against the *ström*.

Should the visitor prolong his stay till September he may participate in the gathering of a rich sea-harvest of another and more exciting order. With autumn, cruising south comes grindehval, not singly but in schools of anything from one hundred to a thousand. He is a small whale, twelve to twenty feet in length, and he is greatly prized by the islander. His capture means meat, oil, and leather. Even his teeth, like date-stones, but ivory white, are acceptable, serving as counters in the card-games which pass the long winter evenings. On his approach, signalled by firers from island to island, the archipelago resounds with joyous shouts of 'Grindehval! grindehval!' Every able-bodied man—and sometimes woman—drops the work in hand and takes to a boat. The chase may last a few hours or as many days. Terrified by the shouts and savage war-songs in his rear, grindehval scurries from *ström* to *ström*, headed in each direction by a flotilla of boats, till, finally losing his head entirely, he flounders into the shallow at the head of some fjord, and is finished with the thrust of a knife one hand's-breadth behind the blow-hole. Then do the islands feast and rejoice. Grindehval produces an annual revenue of about seven thousand pounds. Of this one-tenth is divided into three parts, which go to Church, clergy, and Crown. The remaining nine-tenths pays 1 per cent. to the schools and 1 per cent. to the poor. The balance is divided amongst the participants in the chase, each taking an equal share for every member of his or her family.

AT ARROCHAR.

The wind and rain contend for mastery,
Across the mountains clouds incessant sweep,
Along the loch the waves foam-crested leap
And seem to race in reckless rivalry;
The torrents, in their course past rock and tree,
Crash downward with a roaring echo deep,
And seem like spirits whom no bonds can keep
Confined, as they still struggle to be free.

All Nature seems to riot, rage, and fight,
And yet, at times, her gentler self displays
When through the clouds the sun's far-glancing rays
Break forth and shed upon the scene their light,
Which paints the mountains with a golden hue
And flecks the heavens' face with tints of blue.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

THE affair of the German Emperor and Lord Tweedmouth in the spring concerning the naval programmes of this country and Germany will not be forgotten for a time, even though it was very soon made apparent that far too much significance was attached to it in the first instance, and then the original sensation peddled out very tamely. But it was of immense interest as indicating a curious and almost unique temporary association of a secret character between the sovereign of one country and a chief Minister of another, and parallels for it were hard to discover. Now, reading through the recently published *Life of John Delane*, the great editor of the *Times* newspaper, written by his nephew, Mr Arthur Irwin Dasent, one encounters a most interesting piece of history which makes a certain analogy with the incident we have just referred to. It occurs in a letter written by Lord Palmerston to Delane in 1858, in which he gives the full explanation as to why he and Lord Clarendon went to see the Emperor of the French at Compiègne in the autumn of that year—an explanation which the British public was very anxious to have at the time, but which was denied to it. It caused extreme irritation among a large section of the people, who felt that Palmerston had made a grave mistake. But he made out a very good case for himself in his letter to the editor. 'The invitation was not sought for by us,' he said, 'and was to both of us very unwelcome. As for myself, I was comfortably settled at Broadlands, greatly enjoying the amusements, pursuits, and interesting occupations belonging to a country residence. . . . Moreover, I well know that the Emperor is much out of favour with the Liberal party at present, and that they will be far from being well pleased at seeing us go to him. But then we felt that to refuse the invitation without some good and acceptable reason would be an incivility almost amounting to an affront. But good reasons we had none to give, except the true ones, which would have been anything but well taken. To tell a sovereign that it was a bore to leave one's home to accept his hospitalities would be a rudeness not sanctioned by established usage, and to tell a sovereign whom we wish to have as an ally that public men in England are afraid of going near him because he is so hated by the British nation that anybody who accepts his invitation will fall under the ban of public censure would not be a very good way of securing a good understanding between the two countries. If either Clarendon or I had been tied by the legs by gout, that would have been a sufficient excuse, but we are both known just now to be remarkably well. We, therefore, decided that it was better that we should face any additional abuse which our going might bring on us personally than run the risk of producing upon the Emperor's mind an impression which would be injurious to the interests of this country, by souring the feelings of the Emperor and by greatly cooling down that personal goodwill which he now entertains for Clarendon and myself, and the maintenance of which is far from unimportant in its bearings upon the mutual relations of the two countries.' And so it would seem that a seasonable attack of gout, on one occasion at all events, was much desired for the diplomatic ends that it would serve; but, constant in its enmity, the malady was missing when it might have served the part of friend to Minister and party.

* * *

In the heart of the town, but quiet, peaceful, and solemn, with much historic association, the Temple, the abode of counsel, is at once the surprise and the delight of visitors to London who find it for the first time, and it is occasionally the happy retreat for a few minutes of the worker in the Metropolis, who finds much that is soothing to the nerves in the contemplation of those old blocks of buildings, the wide quadrangles, the cloisters, the old church, the trees, and the splashing fountains—so many things that would seem to appertain better to

 [*All Rights Reserved.*]

some sequestered corner of an old cathedral city in the country than a place which borders on Fleet Street, is separated only by a thoroughfare from the Law Courts, and is but a penny ride in an omnibus from what many people regard as the heart of the world—the Bank of England and the great money-centre round about Thogmorton Street. This was the home of the Templars after they removed from Holborn in 1184, and now it is the working quarters and sometimes the residence of one of the three class-sections of the people who only, according to King James in a speech that he made in the Star Chamber, had any right to settle in London, these three being the courtiers, the citizens, and the gentlemen of the Inns of Court. It was in the reign of this monarch that the Temple came finally and absolutely into the hands of the lawyers, and in these days it is most difficult for any one who is not a law-student or has not been called to the Bar to obtain rooms there save as the sub-tenant of some person properly qualified for residence. It may well be imagined that to these historic quarters, where almost every building is endowed with rich legend and anecdote of famous lawyers and others of bygone ages, the man with the pickaxe—the agent of the vandals—is seldom admitted, and indeed it is a rare thing for even a trifling structural alteration to be made to any of the premises that are within these gates. But the Americans and the country-people who pass in this year will find evidences of a recent demolition, and the circumstance is sufficiently noteworthy to excuse some notice of it. No. 1 Brick Court has been broken up by the housebreaker, but as it happens, this No. 1 can quite well be spared by the lover of Old London whose mind is peopled with the historic ghosts of the past which, if turned out of one of their haunts, would seem to wander aimlessly and hopelessly in the purlieus. Little that is noteworthy has ever happened in the chambers of this building. Great men have not lived there, nor have they assembled there. In association, No. 1 Brick Court is, or rather was, one of the meanest places in the Temple, and for its sins of omission it has come by a doom which some of the better-frequented buildings, were they animate, would regard as a salutary warning to every number in every court. Now, with the neighbouring No. 2 Brick Court the case is quite different. Here Oliver Goldsmith lived a piece of his life, and died; and while he lived in the court he had as his neighbour, in the rooms beneath his, a man who was of such importance in legal history as the learned Blackstone. In those days Blackstone was studious, and liked quiet for his literary work, chiefly the preparation of his famous *Commentaries*, while Goldsmith would have his merriment when he could. He had done his rooms up nicely with a good cheque he had received for *The Good-Natured Man*, and in them he entertained his friends to supper-parties, which were preceded and followed by divers entertainments of a somewhat rollicking character, such as blind-man's buff and dancing. One time Sir Joshua Reynolds, on peeping into these chambers to see how Goldsmith was getting on, found him kicking round the room a paper parcel containing some kind of sartorial finery which he had ordered, but the bill for which he was quite unable to settle. In such days as these poor Blackstone in the rooms below found it a very hard task to write learned and intricate books on the law which should serve as guides to future generations of lawyers. Many books full of rich anecdotes could be written about the other courts and chambers in the Temple; but here there is only justification for repeating one of them, since it concerns a demolition, as does what we have said of Brick Court. It is Paper Buildings now, and they were once burnt down through what we may call the eccentricity of a certain learned judge—Mr Justice Maule, to wit. He was a merry soul, perhaps no merrier has ever sat upon the judicial bench, and no doubt it is well that this should be the case. His lordship liked the old port that was to be obtained at the benchers' dinners in the Inn, and having accounted for a bottle or two of it, would make a somewhat uncertain way from the dining-hall to his chambers. He made a practice of reading in bed every night in all and any circumstances, and on one such evening as this he made full preparations for the last look of the day through some printed pages, said preparations involving some confusion as to the functions of a lamp and other things. What happened precisely will never be known; but it was clear that the bed was set on fire by the lamp, and when the learned judge woke he came to the conclusion, as he himself afterwards said, that he was merely dead, and that he had, unfortunately, not been carried to Abraham's bosom. The fire spread, and it accounted entirely for Paper Buildings, which was not at all a bad thing, for they were rickety old things and were replaced by the finest block that is to be found in the Temple in these days.

* * *

We said a little way in front of this paragraph that to many minds the heart of the world was the Bank of England and its golden purlieus, and it is a fact that the crowds of visitors from the country and foreign parts who come to town in the summer-time find the contemplation of no piece of masonry so fascinating as they do that of the 'Old Lady of Threadneedle Street,' as it is called. Any day you may see little crowds of wondering spectators gazing at the place where all the money comes from, as they regard it, and making more or less successful efforts to divine the secrets of the mechanism of this wonderful institution. Now, it is practically impossible for any day to pass without some incident of curious interest happening in the course of the business of the Bank, though the officials have become so much accustomed to such that they let them pass with but little heed. Often enough notes

come back with the most curious inscriptions on their backs, and perhaps it is not to be wondered at that for the most part they are of a melancholy character. But stranger are the circumstances attending the varying life of notes, and when, the other day, it was stated that a note had got back to the Bank after an absence of very unusual length, we were prompted to some inquiries concerning the common duration of existence of the notes of various denominations, with interesting results. The average life of the popular 'fiver,' so it is said, is sixty-two days; that is to say, after so many days have elapsed since its issue from the Bank, and possibly having changed hands several times during the period, it finds its way back again for cancellation. One may remark here that when once a note goes back to its home it is never reissued. The signature of the chief cashier is torn off, and it is then stored in the Bank-Note Library, where about eighty millions are kept at the same time, all carefully indexed, so that hands could be laid on any particular one at a moment's notice. After each note has been kept for about five years it is destroyed. Now, as said, the average life in the outside world of the 'fiver' is sixty-two days, of the ten-pound note it is fifty-eight days, of the notes of different values from twenty pounds to one hundred pounds it is a month; while it comes down to ten days in the case of notes of from two to five hundred pounds, and curiously enough goes up again to fifty-five days in the case of the awe-inspiring one thousand pound note. These are the averages, but the durations from which they are deducted vary greatly; and it is a curious circumstance that the Bank has in its possession a note that came back after being out for one hundred and eleven years. But stranger still, at the first glance, is the story that hundreds of notes never come back at all, and the Bank, of course, profits to the extent of their value. The explanation is that they are stored away by miserly people—and particularly, so it is said, by old ladies—who delight in the contemplation of the possession of them and are unwilling that they should ever be turned to practical interest-bearing account or be represented merely by figures in a bank pass-book. They are willing to pay for the pleasure of holding the notes, and in this way many of them are hidden and lost. There is much hidden paper treasure in this country which would be well worth the finding. The Bank's explanation of the varying durations of average life of notes of the different denominations is that the 'fivers' last because they are passed from man to man, and do service for several owners. Notes for hundreds, on the other hand, are quickly paid in on account of their value, while the ponderous thousand-pounders are almost exclusively issued to other banks, who hold them as reserve, and it often happens that some time elapses before they are paid out to customers. An interesting point is that the Bank has about fifteen million pounds' worth of paper-money in circulation at the same time.

We come again in the process of the seasons to the happiness of contemplation of sunny seas, of sailing upon them, of lingering idly on their margin, and of bathing. One is led to the idea that sea-bathing is not so generally popular as it used to be; it certainly is not by any means the fashionable diversion that it was once upon a time. In these days the holiday-making section of the public takes its morning dip in the sea in large numbers during the months of July and August; but to many modern folks, those who increase in their cultivation of luxury and ease, there seems something suggestive of Sparta in this habit, and indeed it often seems only to be pursued by those who are conscious of giving to themselves somewhat rigorous systems of life to act upon. Those who make their livelihood by the sea will tell you that generally bathing is certainly not so popular as it once was. They think that the great increase in amusements provided for holiday-makers, and the vogue of the bicycle, the car, and of games, have had something to do with bringing about this result, and the more well-to-do seem to prefer to take their sea-water bath in their hotel instead of in the chilly open. Certainly it is the fact that as a fashionable diversion this open sea-bathing has almost completely 'gone out,' and it is difficult for people to realise now that there once was a time when it was 'the thing' of all others, and no healthy person of social importance was complete in his ways unless he practised it at seasonable opportunities. Many readers may be surprised to know how very modern an institution is this sea-bathing. So far as has been discovered, the eighteenth century was far advanced before any one in this country took a regular ceremonial sea-bath, and the place that it was taken at was Weymouth in the year 1763. It happened that there was a certain well-known philanthropist of Bath, of the name of Ralph Allen, who fell sick, and when he consulted his doctor about his complaints that gentleman recommended that the patient should bathe his bare body in the open sea. This prescription seemed at that time to savour very considerably of freakishness; it had not been done before, and it appeared to be a counsel towards something in the nature of heroism. Notwithstanding, Mr Allen obeyed, and he had a special kind of bathing-machine made for his purpose—the first bathing-machine, as it is believed to have been. From it he entered the sea, bathed, and came out again all safe, the public looking on in much surprise and even some anxiety. It was greatly reassuring to them when they learned afterwards that the treatment that had been prescribed had been entirely successful. Some years elapsed, however, before a habit was made of it, and perhaps we have to thank good King George the Third for the establishment of it, for certainly His Majesty's first sea-bath, also taken at Weymouth, attracted more attention than any other had done up to that time, and did almost everything to set the fashion. That

was in 1789, and it was a great day when George the Third went out to bathe in the open sea. Every precaution had been taken beforehand that His Majesty might pass through the trying ordeal with as little discomfort as possible, and the people assembled in the town made preparations to show their appreciation of his indomitable courage. For many days in advance the royal physicians had carefully trained him for the event, and had instructed him to take a salt-bath in his room every day for the purpose of accustoming him to the feeling of salt-water upon his skin and to ensure that the sea when it touched him should have no sudden and harmful effect. Then, as Fanny Burney wrote, the preparations of festive loyalty were unusual. Not a child could be met that had not a bandeau upon its cap of 'God save the King.' The bargemen wore it in their cockades, and the bathing-women had it in large, coarse girdles round their waists. And no sooner was the kingly head doused beneath the wavelets than a band of music which had been concealed in a neighbouring machine struck up 'God save great George our King!' And so was the royal patronage given to sea-bathing, and the people of lesser light made due and proper haste to follow suit.

* * *

Whatever views one may hold as to the need for the religious education of the children and of the desirability of its being conducted on particular lines, there can be little doubt that the public as a body long since grew weary of the parliamentary farce of one Government upsetting the legislation of its predecessors, and of the threatened continuance of this sort of thing indefinitely while parties seemed hopelessly embittered and irreconcilable. This futile wrangling has brought the minds of many practical men to a state of indifference to the view of all educational parties, while it has undoubtedly created a feeling that it is time a grand remodelling took place of the entire system of the education of the children of the great majority on lines that will better serve their purpose than the present ones. This does not mean that they want the children to be taught joinery instead of grammar or machine-minding instead of geometry, but that some sound knowledge should be imparted to them of the things that they will have to talk and think most about in the days of their after-life. Agreeing that it is most desirable that children of all classes should be given instruction in the circumstances of the arrival of William the Conqueror, of the victorious campaigns of the fifth Henry, and of the stirring and significant events of the Reformation, it is surely the perfection of absurdity that the child should go out into the world with the idea that English history came to an end on the accession of Queen Victoria, or at the very latest at the passage of the Reform Bill. The boy who will soon have his vote is vouchsafed not a crumb of knowledge of what the British Government has been doing in recent years—in the years when his father was growing to manhood, and later when he himself was emerging from puling infancy. Wars may be fought, great social upheavals may be brought about, the conditions of labour and remuneration may be changed, epoch-making legislation may be passed, and parties may be recast; but this child, to whose future these things mean absolutely everything, goes out into the world knowing nothing of them. He knows, indeed, who were the Picts and how the Romans made roads and built walls, and how the early Britishers held their first meetings for local legislation of a rude type; but he has no perception of the difference between a Liberal and a Conservative, and not the very faintest idea of what a Socialist is. And how necessary it is now that the children should know what a Socialist is, and what he aims at! Risk the child becoming a Socialist himself, but do let him understand the meaning of the movement which is beginning to shake the civilised world and the entire condition of things that has obtained ever since England was England. The boy of fourteen or sixteen knows nothing whatever about the principles of local government as he should do; he knows nothing about the great questions which constantly arise in the determination of the relations of the rich and the poor; he knows nothing of the way in which money is banked, companies made, and shares bought and sold. He could write you a fine essay about Oliver Cromwell, but not a line about Mr Asquith, who matters much more to him. Of Charles the First he knows many things, but of Edward the Seventh the most that he can often say is that he is the eldest son of the late Queen Victoria, and that it is the constant prayer of the people to God that he should be saved. He knows next to nothing of the British Constitution as it is. And it is the same in other directions. He knows what is the equivalent of x^2-y^2, but he has not a glimmer of a notion as to how a motor-car is made to move. The child is turned out into the world of progress, controversy, and strife in this appalling state of ignorance about everything that concerns him, and he is left to forget all that he learned at school, and to pick up as best he can, if so disposed, all the grand essentials that he should have been taught. He finds in most cases that he has other things to do, and so he goes on to the end of his life in a more or less complete state of ignorance. It is not as it should be. We are speaking, mind, of the children of the great masses who receive free education in Government and other schools, the children about whom successive Governments and Oppositions have been wrangling through many Parliaments. We were told just lately that at the entrance examination to one of the military colleges some 'general knowledge questions' were set as usual, and that one of these was 'Who is Mrs Pankhurst?' Now, the association between women's suffrage and questions as to the constitution of army corps is not obvious, and a soldier might

get on very well as a General without knowing whether his lady-friends had the chance of getting into Parliament or not. But the idea is sound, and it is curious that it should be adopted in such a quarter when the wider non-military public steadily ignores it. It would be an excellent thing if every little Tommy Smith when he got into the sixth standard knew who Mrs Pankhurst is, and, better still, if he could tell his examiners how many Labour candidates got in at the last general election, and why. For his knowledge of these matters we could forgive him a vast ignorance about Cardinal Wolsey. We know what some people have to say about such a view of things as this. They say that the people come to know too much, have been doing so for many decades past, and that if they must be taught it is well that they should be taught things that do not matter and which they will forget. But that view may be ignored for the present.

A PAWN IN THE GAME.

CHAPTER XXXIII.—IN THE DAWN.

JACK slept for an hour the sleep of mental and physical exhaustion, then he awoke, and his thoughts were instantly busy with the dreadful fate which had befallen him. Could the Arabs help him? He mistrusted their skill, but he mistrusted still more profoundly their compassion. The loss of sight seemed absolute, but its suddenness puzzled him. He imagined that the intense light of the day had paralysed the optic nerve. Whether the injury was fatal he could not guess; he must simply bear his fate.

Men of his race and faith, he reflected, had borne disaster as cruel and kept their manhood. He set his teeth together in the darkness. He could at least endure. There crept into his memory a famous passage in the *Iliad*, the prayer of Ajax for light. It was one of the scanty bits of Greek that still lingered in his recollection, and with a bitter smile he whispered the sonorous lines.

But he wanted something better than pagan courage of this type. How did his faith stand the shock of such a disaster? He remembered the psalm that had sung its music in his brain at the sight of the Judean hills: 'I will lift up mine eyes unto the hills.' But how could blind eyes look to any hills or to any heights of divine power and love above the hills of earth for help? The mystery of his trouble—the cruelty of it—to be smitten blind at the moment of escape, and so slavery itself to be made hopeless! How could faith itself emerge undestroyed from such a stroke?

Then into the cells of his brain crept the message of another psalm, 'Thy way is in the sea, and Thy path in the great waters, and Thy footsteps are not known.' A God beyond the reach of man's broken thought! Yet the message runs on, 'Thou leddest Thy people like a flock.' Was the hand of God really leading him through these dark realms? 'Clouds and darkness are round about Him'—poor Jack felt the truth of those words—but 'righteousness and judgment are the habitation of His throne.' Yes, God still lived, and shaped human life. And He shaped it to ends which, no matter how far off, were noble and good. And this life is not all.

Then Jack slept again. He awoke some hours afterwards, and lifted his head. Across the dreadful veil of darkness in which, he believed—as well he might—he must dwell for the rest of his life, was drawn a line of crimson. It grew richer; it broke into a glory of diverging rays—flaming lances of colour that shot upwards to the zenith. What strange vision breaking in on blind eyes was this? Then, in glad wonder, with arrested breath and trembling lips, Jack realised that the dawn was spread before his eyes—the sunrise, the arched immeasurable skies, the desert landscape. It was day. His blindness had gone! And no garden of dew-wet flowers, with the song of the lark hung high in heaven above it, was ever half so beautiful as the stretch of brown and desolate sand.

His bewilderment was overpowering. His sight went, as by some dreadful stroke of magic, and went in a moment; but it had come back in a moment, and as if by some miracle. 'The Lord,' he whispered, 'is my light and my salvation; whom shall I fear? The Lord is the strength of my life; of whom shall I be afraid?'

The old sheikh presently came up and examined his eyes and turned away with a nod. It puzzled Jack that neither his sudden blindness at sunset nor his sudden recovery of sight when the dawn returned seemed to surprise the Arabs. All that day the music of gladness was in his blood. His escape, he believed, was only postponed for a few hours, and he commenced to study the landscape afresh so as to fix his course at night.

But at night the same mysterious darkness closed round him again. He was shut in it as in some strangling mist. Above him, he knew, were a myriad flaming stars; about him were the faces of his companions; but all was blotted out. He commenced to ask himself with breathless anxiety, would the sight that so strangely forsook him come again with the dawn? He slept little that night, staring into the darkness and wondering if across its dread-

ful canvas would ever be drawn the red glory of returning day.

But with the dawn his sight came back. Then he guessed what had happened to him. He was attacked by the curious night-blindness from which, as Corporal Lebrun had told him, many of the French soldiers suffered when they first came to Egypt. What was its exact cause no one seemed to know. Perhaps it was that the iris of the unaccustomed eye contracted so closely under the white glare of the long day that it temporarily lost its power of dilation; and when the flood of scorching light was withdrawn the eye was for a time blinded. As a matter of fact, scores of soldiers in Abercrombie's army, when it landed in Egypt, suffered from exactly this recurring blindness—a complete loss of vision every night—an experience which stretched through weeks.

Jack's dread of being permanently blind was immensely lightened; but was ever an unhappy slave, he reflected, so beaten with disaster? The vivid, living world—the world of colour and form and movement—was withdrawn from him every night, and he was left shut up in a darkness which had all the offices of a prison. In the night lay his sole hope of escape; and now with each night there fell upon him a helplessness more complete than that of a child.

But though Jack mourned that lost chance of escape, he made up his mind that it was only postponed. Other chances would offer themselves—or he would invent them. He had tasted the terror of blindness; and to find that he could still see the light made all other ills for the present seem trivial. From this point, indeed, an odd certainty of escape possessed him. Each miraculous return of vision seemed a message of hope, a symbol of supernatural and living forces busy about him.

For nearly a month this strange experience of alternating blindness and vision was repeated; and during the whole of that period the party pressed steadily southward, camping every third or fourth day at some little oasis—a patch of verdure, with a few scanty shrubs, hidden in some hollow of the sand. The wells of the oasis were usually mere holes into which crept a trickle of water. With each day's journey to the south Jack knew escape grew more difficult, yet his courage never drooped.

The Arabs, after their first examination of his eyes, took no further notice of them. They understood the whole incident, and knew that the intermittent blindness would pass. But the three black slaves in the party were sullenly jealous of their white fellow-captive, and they found in the recurring spaces of his helplessness from blindness a safe opportunity of cruelty. They played endless tricks on him during the night. Some object—a saddle or a bundle of cloth—would be set in his path to make him stumble, and each fresh disaster was greeted with shouts of cruel laughter. One night by a trick they led him into the fire that was kindled, and his feet were cruelly burned. The jests grew yet more dangerous, and Jack knew he must stop them. The leader of these performances was a huge negro named Sidi, with arms which for reach and strength resembled those of an orang-outang. Jack looked at him steadily; the man's brute strength was immense, but it was clumsy as well as huge.

'A good English boxer,' he said to himself, 'could write some wholesome lessons on your flat nose and broad cheeks, my friend.'

The tricks that night were more impish than usual. In the morning, as soon as his sight was clear, and before the camels were loaded for the march, Jack walked quietly up to Sidi, who was sitting in the sand devouring his breakfast. He clutched his short woolly hair and lifted the astonished negro by it to his feet. He pointed to his eyes expressively by way of explanation, and in broken Arabic made it plain that he proposed to administer a sound thrashing by way of punishment for the ill-usage of the night.

The Arabs gathered round as though it had been a cock-fight, and with laughter explained to Sidi that he must fight the white man. With a menacing look the negro snatched a knife from his belt, but the old sheikh, who saw that Jack was armed with nothing better than his naked hands, struck the knife from Sidi's grasp. The negro looked at his opponent for a moment; then he put down his head like a ram, and with a roar of rage charged. Jack stepped lightly aside, and as the huge body of his opponent rushed past him struck on the broad naked back with the flat of his hand a resounding blow. A shout of laughter went up from the Arabs. Sidi turned, and with new access of fury leaped at his opponent, his long, baboon-like arms stretched out to grasp him. Jack sprang back; then, as his antagonist stopped, leaped in, and with his right and left struck in quick succession two furious blows on the negro's eyes.

'I will teach you,' he thought grimly, 'what blindness feels like.'

Sidi came on again, but Jack, a good boxer, had no difficulty in repeating the punishment, ending by one tremendous blow on the negro's flat nose. The blood ran down his black face in hot streams, and with the running blood Sidi's fury seemed to slip out of him. He stood with both eyes swollen and closed, and his inky features reddened with blood. He was blind. Jack then turned to the two astonished blacks who had looked on, and with expressive gestures explained that every morning he would avenge in that way the tricks of the night.

That night the two negroes expended their impish humour on Sidi, as being the safer victim of the two; and Jack guessed what was happening by their laughter and by the angry shouts of the huge negro. When morning came he trounced the two offenders, and made them understand that he would punish tricks on poor Sidi as though they had been tricks on himself.

Jack found that his victory over the huge negro had given him something more than immunity from insults on the part of his fellow-slaves. He had established that strange mastery of the white man over the black whose secret lies so far back in history or is hidden so deep in facts of mental and physical structure as to be beyond explanation. When Sidi found that the white slave who had thrashed him was yet his defender from the torments of his fellow-blacks his gratitude was dog-like. So complete became his influence over the blacks that Jack began to dream of joining them with him in a plot against the Arabs. But he looked at their faces afresh. It was clear that if they had the docility they had also the garrulity of children. They could not keep a plan secret for five minutes. He must depend on himself.

(To be continued.)

ON THE FOSS WAY.

IN the days of the world's greatest road-makers was traced this wonderful Way from Axminster to Lincoln. Undeterred by the far-stretching wilderness of land, with its mighty forests, morass-like valleys, and lonely heaths, the Roman proved his right as conqueror by making this amazing thoroughfare, a legacy of his power and determination for all future peoples to inherit. For many a mile the Foss Way even now holds its own, high-banked, fenced in, from twenty to thirty yards in width, and bordered by grassy commons, raised on ridges or winding straightly into the vales to climb to exactly the same line on the farther side with an invincible tenacity strangely akin to the character of the men who made it. Part of the original paving can still be seen. Stukeley speaks of the Foss between Ilchester and Axminster as 'composed of the flat quarry-stones of the country, laid edge-wise, and so close that it looks like the side of a wall fallen down;' by Willoughby-on-the-Wolds the road is paved with red flints placed upon a gravel bed. Along this wide fenced-in road the Roman legionaries thundered. Traffic, such as it was in those days, slowly wended a toilsome way betwixt the land of an uncivilised race. One can imagine how the wild Briton viewed with loathing and despair these signs of the all-conquering nation. To him the Roman roads must have been as hated and as feared as the massive Norman keeps which in later times bound Saxon England in chains of iron. Even the Britain of to-day feels the tenacious grip of the Roman invader. Stamped deep into the soil, the remnant of the roads he builded still tell their tale of conquering might, and laugh to scorn the efforts of mere decades to efface them.

Some hold that the Foss Way ran from Lincoln to Exeter, some that it went to the mouth of the Axe near Seaton. Of a certainty it ran to Axminster, but even from Dinnington hence it is not easy to trace. In many parts modern roads occupy its course; in others it is but a grass-grown bridle-lane. Overlooking the Somer valley, a spur of hill too steep for modern wheeled traffic shows the road almost in its original state—a ridge some three feet in height betwixt two hedges. Near Grittleton the grassy way is so beset with nut-bushes and ferns as to be well-nigh impassable; between Bath and Cirencester there is not a village to be found along its route; and through Warwickshire it is scarcely more than a field-lane. Of Roman towns along the Foss Way, Ilchester is now but a village, Bath a popular resort, yet not so much so as in the days of Beau Nash, when fashion flocked to drink the waters and amuse itself in the assembly-rooms. From thence for twenty-nine lonely miles the Foss runs steadily onwards to Cirencester, the Corinium of Roman times. Four great roads meet by the tower of a glorious church, yet ancient Cirencester was not founded by the Romans. It was the capital of the powerful Dobuni tribe, and was called by them Caer-Coryn ('the town at the head of the waters'). Even the very manner in which the Foss enters and leaves Cirencester suggests that a town of some sort already existed. But in Chedworth valley, secluded amid leafy woods white with lilies in the spring-time, nestles a Roman villa. And now the Foss Way runs through the Cotswold country, toiling straightly up and down the hills. Great uplands, bare and beautiful, steeped in mysterious lights and ghostly shadows, stretch far on either side; vast spaces glow with the glory of carnation-hued sainfoin; grassy downs are dotted with belts of fir or tiny gray homesteads. Covered with sheep they were in the days of the Cotswolds' pride, when the famous fleeces brought fortune to the wool-merchants.

The old town of Northleach stands on the Foss Way, in the very midst, as it were, of the wool-industry of the fourteenth and fifteenth centuries. Roman it is not, nor has it any pretension thereto; but many decades have passed over the quaint gray town, and left their trace of time and travel-stain. Ancient Foss—a thousand times more perilous then than now—must have been trodden by merchants journeying from afar to buy wool at Northleach; mighty wains drove deeper the ruts of centuries ago. In the midst of the town a magnificent Perpendicular church, rich in altars, and richer in brasses commemorating wealthy merchants, rears itself above the clustering gray roofs and a sparkling stream. In the churchyard lie the Midwinters, the Bushes, and many another Cotswold name, family by family; through it pass the townsfolk of to-day, busy upon their leisured, unhurried occupations: and just beyond an emerald meadow glows with a

fairy fantasy of mingled pink and white may-bushes. Northleach came into prominence once again in the coaching days, for it stands also on that wonderful high-road from Oxford to Cheltenham, so that the quiet town resounded with the merry notes of the horn, and all folk bustled forth to see the coach rumble in and hear the news. Alone and aloof nowadays, hugging its history deep into its heart, it yet dominates the Cotswold uplands; even from afar you may see the church tower outlined against an azure sky, keeping watch over the hills. And the Foss Way runs steadily onwards through picturesque Bourton-on-the-Water, and so to Stow-on-the-Wold, whence most roads climb by reason of the famous fair. But the Foss takes one of its few bends from its direct course, and wends through Moreton to Halford, and on through Warwickshire until it crosses Watling Street, the greatest of all Roman thoroughfares.

By the side of the Foss, three miles north of Leicester, was discovered in 1771 the oldest milliary in Britain. The inscription, worn and defaced, commemorates the Emperor Hadrian in the fourth year of his reign. Therefore before A.D. 120 the Foss Way was in existence. Ratæ, as the Romans called Leicester, was an important station, and ever since has played a notable part in history. You cannot pace the clean, wide streets of to-day without thinking of its founders, crumbled into dust thousands of years ago. Are not two arches of the Roman wall built into the railway viaduct? And we can follow its story up through the centuries. On the site of St Margaret's Church stood the Saxon cathedral; two gateways of the Norman castle still remain. At Leicester, Richard III. passed the night on his way to Bosworth Field, and after the battle his mangled body was buried in the Franciscan convent founded by the noble and ill-fated Simon de Montfort. Not for long did his bones repose in consecrated peace. At the Reformation his ashes were ignominiously cast into the river Soar, and his stone coffin made into a drinking-trough for horses.

Clean through Nottinghamshire the Foss Way is carried, stamped unmistakably into the soil. Right to Lincoln it continues its undeviating course, and there stands the celebrated Roman arch, the New Port or North Gate of Lincoln. Here the Foss Way fulfilled its mission; its makers rested from their labours. For it is Ermin Street which, passing through the Gate, runs north twelve miles straight as an arrow.

It is a toilsome way from Axminster to Lincoln. Only undeviating, unflinching tenacity could have carried through an enterprise so vast and so lasting. Almost it would seem as if the Romans builded for an eternity of which they knew little. Modern roads occupy some of its course; modern traffic tears to and fro regardless of its history. Yet surely on the grassy tracks and green bridle-paths, along lonely ridges and over wild, barren spaces, in the silence and the shadows, the Foss Way still remains the property of the men who made it. Surely as the sunset reddens athwart the heath and the violet dusk steals across the solitary, silent land, the charmed hush is broken by the clank of Roman arms and tramping legions, while hating Britons—ancestors of our own—peer through the undergrowth of leafy glades. And away yonder among the hills the heavy wains toil continually into lowly vales and ascend the downs, and companies of portly merchants ride into Northleach, or the shout of triumph wakes the echoes as the coach tears into the town with news of victory. And ever ghostly armies march and countermarch, and clashing of battle and weird cries break the stillness, so that as darkness falls from length to length, from Roman Lincoln to Axminster the Foss Way is alive with sound and peopled with warlike denizens, and those who stamped its course deep into Britain's soil hold the Way their own though centuries pass and generations perish and empires fade.

THE TREE THAT EATS.

By Brew Molohan.

'HERE is something that will interest you, Fletcher,' I remarked as I picked up the morning paper. 'Listen: "At the orchid exhibition yesterday a superb specimen of the *Epidendrum vexillaria* was purchased by Lord Southwold for fifteen hundred guineas."'

Fletcher yawned. 'Serves Southwold right,' he said. 'I offered it to him three months ago for five hundred, with a guarantee that it was the only one of its kind in the country, but he wouldn't accept.'

'Oh! was it you who found it?'

'Yes; it formed one of the collection I brought from the Malay Archipelago last year.'

'You were very successful over that trip, weren't you?'

'Fairly. After all expenses were paid I made about twenty thousand pounds.'

'Twenty thousand pounds!' I ejaculated in amazement.

Fletcher smiled wearily. 'Seems a lot of money for three years' work, doesn't it?' he replied. 'But you must remember that if the pay is big the risks an orchid-hunter runs are correspondingly great. Cutting his way through tangled forests, wading through stagnant swamps, always on his guard against savage beasts and still more savage men, the orchid-hunter earns every penny of his money; and if he has an experience such as I encountered

on that trip no monetary reward can repay him for the danger he runs.'

'You had a striking adventure?' I remarked tentatively.

Fletcher looked at me for a moment in silence, then he said quietly, 'I have not told the story to a living soul in this country, because it is so much outside the bounds of probability that nobody would believe it; but that it actually occurred this will bear witness;' and he slowly removed a wig from his head.

'Why,' I exclaimed, 'I didn't know you were bald!'

The few remaining hairs were cut close to the head to admit of the wig fitting closely, and, to my astonishment, the scalp was dotted all over with bare patches varying in size from a pin-head to a shilling. On examining these closely I saw they were covered with new, delicate skin, and from their appearance it was evident that the old skin had been torn away at a comparatively recent date.

'Curious sight!' remarked Fletcher as he replaced his wig. 'Makes me look like a Dalmatian dog! Say, let's have lunch here, and over it I will tell you the story, although I don't think for a moment that you will believe it.'

The Explorers' Club is noted for its cuisine, and we ate slowly, enjoying to the full the good things provided by Felix. When the coffee was placed on the table Fletcher lighted a cheroot and settled himself comfortably in his chair.

'When,' he began, 'I started for the East four years ago it was with a fairly definite idea of the country I meant to work. My previous experience of orchid-hunting had taught me that the more out-of-the-way the district the more valuable, as a rule, is the orchid, and I determined to strike away from the beaten track altogether, and explore some of the little-known valleys in the interior of the huge islands which stretch from Singapore to Australia.

'Hiring a sampan manned by a Malay and two Chinamen, I touched Sumatra, Java, and Bali, and then crossed over to Celebes, where I met with a fair amount of success. I then determined to visit Borneo and explore the unknown interior of that island in the hope that, if I escaped the attention of the head-hunters, I might be able to acquire some new specimens.

'As you are aware, Borneo is about three times the size of the British Isles, and although Sarawak and a strip of the north coast are comparatively civilised, the great bulk of the island, with the exception of the country in the immediate neighbourhood of the Dutch trading stations, is absolutely unexplored. It consists of huge forests, the haunt of the dreaded tiger and the no less dreaded orang-outang, where the merry sport of head-hunting goes on to-day as it did hundreds of years ago, and where a chief's claim to renown depends mainly on the number of heads strung to his roof-tree.

'When I arrived at Mendawi, the Assistant-Resident (who happened to be an old college chum of mine at Bonn) engaged a trusty headman and five Dyaks to accompany me on a lengthened excursion into the interior.

'A word as to the Dyaks. The inhabitants of Borneo have acquired a bloodthirsty reputation in consequence of their propensity for head-hunting; but, apart from this little peculiarity, the race possesses many estimable qualities. Head-hunting is simply a custom arising out of their intertribal wars; and a peculiar feature about the Dyak is that, although glorying in the number of human trophies that he can hang round his dwelling, whilst he is in your service you can absolutely rely on his fidelity, his honesty, and his bravery.

'My plans were to follow the Mendawi River to its source and thoroughly explore the tributaries that formed its headwaters, in the hope that a systematic search in the deep tropical valleys would reward me with some new specimens. The party consisted of myself, the two Chinamen Lung and Kling, the Malay Ali, the Dyak headman Rayut and his five companions; and although the sampan was large enough to carry us comfortably, I took another boat for exploring the smaller rivers and streams.

'On the fifteenth day after leaving Mendawi we sighted the range of mountains that runs through the middle of the island. The weather hitherto had not been oppressively hot; but now a sudden burst of heat set in, and—the river-banks being lined with forest—there was not a breath of air to temper the sweltering rays. For four days we paddled up this reach, and the intensity of the heat was such that during that time the evaporation from the river wetted me like a continuous rainfall as I sat under an awning in the stern.

'When on the twentieth day an opening on the right bank showed where a tributary fifty yards wide ran into the main river, we gladly paddled in there for shelter. The trees on each side met overhead and afforded relief from the scorching rays of the tropical sun.

'The trip, so far, had been uneventful, and it was just before turning into this creek that I first made the acquaintance of the orang-outang—the wild man of the Borneo forests. We were paddling close to the bank, when Rayut, who was in the bow, made a significant click with his tongue. His companions ceased paddling immediately, and he pointed to the branches of a large tree that overhung the water. "*Mias!*" he whispered.

'I saw the foliage move, and, looking closely, made out an indistinct shape descending from branch to branch. Just underneath the tree, and half-embedded in the soft mud, was something which I at first took to be a large log, but which on closer inspection proved to be a crocodile following the movements of the branches with that interest with which every creature, tame or savage, views a probable dinner.

'Suddenly there was a fierce roar, and the *mias* leaped from the tree right on the back of the crocodile. The saurian, realising for the first time the nature of the dinner that he had expected, lashed his tail savagely, and, plunging violently, endeavoured to unseat his rider. Failing in this, he snapped round viciously, trying to seize his antagonist with his cruel jaws. This was what the orang waited for. As the crocodile opened his mouth he suddenly seized the upper jaw, and, planting his feet at the back of the head, with an incredible effort actually wrenched the jaw from its socket with such force that we could distinctly hear the cracking of the bones. A convulsive slash of the tail sent the mud flying in a shower; and the orang, after holding the jaw back to the shoulder for a few minutes as if to satisfy himself that his enemy was no more, seized an overhanging bough and quietly drew himself into the tree.

'I had a good view of the monster, and should judge that he was not less than six feet in height; the arms and body were much longer in proportion than the legs, and a mat of thick brown hair falling over the upper part of the face gave the beast a peculiarly ferocious appearance.

'The creek was comparatively cool when contrasted with the river outside; and, as it promised favourably, I determined to leave the sampan near the mouth and explore it in the small boat, accompanied only by Rayut and Bati, a wizened old Dyak who had been a noted head-hunter in his time.

'At daylight next morning we started and paddled along this highway, which, always of the same width, maintained a sluggish, even way through the heart of the forest. The hot, damp atmosphere was peculiarly favourable for the growth of those trees that the orchid loves to feed on; and, there being no necessity to hurry, we searched the forest in the neighbourhood of the creek as closely as possible. The result exceeded my most sanguine expectations, and I was fortunate in securing some choice specimens of the *Bulbophyllum*, one of which was quite new.

'My method in searching was to land Rayut on one bank and Bati on the other, where they proceeded parallel to the creek at a distance of about a hundred yards, whilst I paddled the boat and called out from time to time to direct them.

'It was on the fifth day that I noticed a marked disinclination on the part of the Dyaks to enter the forest, and if by any chance I omitted to call they both came running to the banks. As cowardice is an uncommon trait in a Dyak's character, I was at a loss to understand their conduct, and asked Rayut what he was afraid of. He hung his head in confusion, and on my repeating the question, answered, "Bati, oh chief! says this is the country of 'The Tree that Eats.'" "What does he mean?" I asked in astonishment. "It is the Evil Spirit of the forest, oh chief!" he whispered, "who is angry when men approach his village." "What nonsense!" I replied with disdain. "Rayut, you are only fit to dig in the fields with women!"

'The taunt cut him deeply; and, not without a certain dignity, he replied, "Oh chief! why does this river run on and on and yet not become smaller as we approach its source? It is because this is the country of the great spirits, and, being mortal, we are fearful of incurring their anger."

'Next day proved, as I had suspected for some time, that the creek was a huge canal constructed in days gone by, when, as may be seen by the huge monuments that are occasionally found in the depths of the forest, the Malay Archipelago was inhabited by a highly civilised race. We had been gradually approaching higher ground, and now arrived at a spot where the canal had been cut across the face of a hill. The depth of the cutting was considerably more than one hundred feet; and, noticing at one point a break in the forest that lined the banks overhead, I climbed to the top. A tornado had worked havoc amongst the trees, levelling an avenue a couple of hundred yards wide, and through this opening I looked down on a small valley running straight in front of me between lofty hills.

'From the situation of the valley, lying as it did between mountains which would deflect the tropical heat, I conjectured that it was a likely spot for the production of the object of my search, and made up my mind to explore it thoroughly. One new specimen would repay the time and trouble ten times over.

'Calling the Dyaks to my side, I pointed to the valley and explained that I had reason to believe that a search there would probably be successful. It was evident from their bearing that they were not enamoured at the prospect; but afraid, I suppose, that I might taunt them with cowardice, they said nothing, although I could see that they were horribly uneasy.

'With some difficulty we made our way down the mountain, and at the foot struck a stream which apparently followed the course of the valley. Confident from the appearance of the trees that our quest would not be in vain, I followed the stream.

'Rayut touched me on the shoulder. "Oh chief!" he said earnestly, "venture not farther into the valley. There is death in the air." "Rayut," I replied angrily, "you are a coward. I shall tell the great Dutch chief to send you into the rice-fields with the women." He ground his teeth at the insult. "I am not afraid of anything that lives, oh chief!" he replied; "but this is the abode of the Evil Spirit. However, we are your children; do with us what you will."

'I strode on once more, the two following closely behind, and we had traversed about half the valley when Rayut again touched me. I turned sharply, to find him pointing through the trees; and, looking in that direction, I saw traces of a clearing showing through the forest. We instantly turned

towards the spot; and, as the steps of all the inhabitants of the forest tend towards the few openings that are to be found here and there, we approached the edge of the trees with caution.

'The enclosure—or enclosures, for there were two, each a few acres in extent—was in shape exactly like the figure 8, and we had struck the lower one about thirty yards from the neck. I was examining the trees all round, when suddenly Bati, with eyes starting out of his head, pulled me violently back, pointing at the same time to an extraordinary tree that grew right in the centre of the passage between the enclosures, and which, owing to the intervention of some foliage, had escaped my notice.

'Picture to yourself a dirty-green pillar—which afterwards proved to be hollow—twenty feet in circumference, and cut off evenly at the height of thirty feet from the ground. From the top, however, rose a circle of whip-like branches somewhat similar to those we see on willow-trees, each fifty feet long and gradually tapering from a circumference of six inches at the butt to a fine point. These almost touched the forest that, running in on each side, formed the neck of the enclosure, and were without a vestige of foliage, but curious circular discs of varying sizes studded the lower side of each.

'But what drew my eyes like a magnet, and made my breath catch with a gulp in my throat, was that on a stump which projected sharply from the trunk at the height of about six feet from the ground grew the most wonderful orchid that it has ever been the lot of man to behold.

'It was almost the shape and size of an umbrella, but no words of mine can even feebly convey the marvellous colours which, as I gazed entranced, slowly changed their hues before my very eyes. What a minute before had been a brilliant scarlet was now changed to a deep blue; this was succeeded by a bright green, to give way in its turn to a beautiful orange, each coming up at the side and slowly extending over the whole face of the flower. I gazed enraptured at the wonderful display, lovingly thinking of the sensation this tropical jewel would create in far-away London, when suddenly my attention was caught by a movement in the clearing beyond, and I glanced up, to see a deer walking through the upper enclosure in the direction of the passage. Its course carried it just by the orchid, which suddenly became a veritable kaleidoscope of changing colours, at which the animal gazed as if mesmerised.

'To my unspeakable horror, as I gazed at the marvellous display I suddenly saw the snake-like branches, which a moment before had been growing vertically, suddenly bend downwards and encircle the unfortunate animal. The deer struggled violently, giving vent to great sobbing snorts of terror, but a couple of the arms enveloped its neck and quickly strangled it, and, to my utter horror, I saw the body slowly lifted from the ground.

'Thinking that it must be a fantasy of the brain, I turned to my companions. Bati had sunk to the ground, his face covered with his hands, whilst Rayut was peering over my shoulder, the eyeballs standing clean out of their sockets, his face the colour of dirty ashes, and the spear dropped from his nerveless grasp.

'I looked again, to see the deer lifted higher and higher—that ghoulish orchid, its work done, changing colour slowly as before. Up, up, the body was raised, and it was horribly uncanny to mark how every arm of the tree arranged itself to the best advantage to lift the weight. Those on the near side of the tree enveloped the body, whilst the opposite branches bent right over, and, entwining themselves round the others, lifted the carcass until it was held at the extremity of their length high above the trunk; then they bent inwards and lowered it slowly into the hollow interior.

'I am not ashamed to say that as the deer disappeared spasms of icy coldness ran through my body, and I trembled all over with sheer fright. The utter gruesomeness of it and the sudden realisation of the danger I had escaped absolutely paralysed me, and I could only gaze with horrified fascination at the unnatural monstrosity.

'Presently my self-possession returned, and with it that covetous feeling with which every orchid-hunter beholds a new specimen. Besides, I felt a certain self-contempt for having given way to the momentary panic in the presence of my followers, and I stood there revolving various schemes for obtaining possession of that wonderful flower.

'Suddenly an inspiration came and I saw a possible means of success. Turning to Rayut, I said sharply, "Rayut, you are a woman!" He turned a look of horrified reproach on me. "You are a woman," I repeated, "and to show you how little a white man fears your Evil Spirit I shall cut that orchid and carry it away."

'The man passed his tongue over his parched lips, endeavouring to speak; his companion lying inert as a log.

'I took a step into the clearing, when Rayut with a convulsive effort flung himself in front of me. "Oh chief," he gasped, "do not approach The Tree that Eats! Be warned by the fate of the deer."

'My blood was up; and, pushing him aside impatiently, I walked to a spot where I was just outside the reach of those diabolical arms. The horrible monstrosity knew of my presence immediately. The snake-like branches bent towards where I stood, swishing stealthily to and fro in their effort to reach me, and the surface of the flower was transformed into a veritable rainbow with flying colours.

'Returning to the Dyaks, who had partly regained their courage on seeing me unscathed, I explained the plan I had formed. We had passed a troop of large monkeys feeding on a mangosteen-tree as we

came up the valley; and, returning stealthily, I shot one, which we carried back to the upper enclosure. Here I explained to Bati that he must push it within reach of the branches when I had taken my station on the other side near the orchid. I hoped that whilst the arms were all engaged lifting the body I should be able to run in and chop away the stump on which the flower grew, Rayut standing by to warn me of danger.

'Bati threw the body towards the tree; in a moment the branches bent and seized it, and, waiting until they were all engaged, I jumped in and struck at the stump. A stream of black liquid shot out as the hatchet sank in the leathery-like substance; and as I hurriedly raised my arm to repeat the blow Rayut shouted, "Fly, oh chief; fly!" I jumped immediately, but was just an instant too late. The ends of three of the branches had settled on my head as I sprang; and, although the momentum carried my body forward, those diabolical arms, stretched to their full length by the weight, held my head and the upper part of my body a few inches off the ground, the discs burning the scalp like so much molten lead.

'Fortunately I did not lose control of my senses, though flashes of living fire seemed to shoot through my brain, and I shouted to Rayut to grip my legs. This he did immediately, pulling his hardest, so that my head was suspended just beyond reach of the other arms which snaked madly to and fro in their efforts to reach me, and failing by a matter of inches.

'In a curiously impersonal manner I called to Bati to grasp one of my legs, and then, advising them to find a firm grip for their feet, I gave the order, "One—two—three—*pull!*" With a superhuman effort they dragged me free, leaving three-quarters of my scalp adhering to the discs. I collapsed then, and remember no more until I found myself on the sampan returning to Mendawi, where my friend the Assistant-Resident nursed me back to health again.

'That happened nearly two years ago; but even now at times the fascination of that wonderful flower overcomes me, and I feel that one day I will return to that tropical valley. If I am successful the orchid will cause a sensation such as the botanical world has never known. If not, another will have been added to the number of the victims of that mysterious horror—The Tree that Eats.'

THE MONTH: SCIENCE AND ARTS.

NEW SUNPROOF CLOTH FOR DRESS FABRICS.

IN a recent issue we drew attention to the important subject of tropical clothing, and pointed out the value of a non-actinic coloured dress material, such as red, for breaking down the sun's rays and thereby arresting the disturbance of the spinal nerve-centres of the body therefrom. In tropical climes the white man labours under a heavy disadvantage in the prosecution of his duties as compared with the dusky native, for discriminating nature has accommodated the latter to his peculiar environment by the provision in his skin of a protective pigment which absorbs the injurious actinic rays of the sun, thereby enabling him to fulfil the most exacting and arduous labours without the slightest fatigue or inconvenience. Under these circumstances it is obvious that the white man should endeavour to reproduce nature's pigmentation protection by artificial means—that is, wear a suitably coloured material which will absorb the sun's actinic rays. The general impression, however, is that the wearing of a coloured material such as red, blue, or orange is to court disaster, and that the body will have to submit to unbearable heat. As a result, a flimsy white duck is the favourite clothing medium. Never was there a greater fallacy. The white, being transparent, offers no resistance to the passage of the actinic rays, and the wearer accordingly suffers the usual ill-effects incidental to the tropics, such as sunstroke, prostration, and stomachic maladies. Were the white material lined with a red fabric complete relief would be secured, and the wearer would be able to carry out his duties even in the fiercest sunlight without experiencing the slightest inconvenience. Science having definitely settled this question, an enterprising firm has patented a fabric expressly designed for service in such climes, in which red-coloured backing is provided to the material. By this ingenious arrangement one is able to wear any description of material, pattern, and colour, checks or tweeds, flannel or cotton, with perfect equanimity just as if he were in his native temperate zone. The red or protective colour does not simply adhere to the inner face of the exterior cloth, but is interwoven therewith, so as to constitute a homogeneous textile, but in such a manner that the colour does not show through the outer face. In this way the tropical resident can secure the various ranges of popular blues, browns, or grays with as much facility as his fellow-citizens at home. Great difficulty was at first experienced in preventing the red material from showing through, but this has now been successfully surmounted. The fabric, to which the name 'solaro' is applied, is of the finest quality of wool, made fifty-six inches in width, and compares in price with the good quality cashmere. The red is absolutely fast, being unaffected either by light or wet, and will not shrink. The wearer can have his suits lined or unlined just as he desires, since the virtue of the material lies in the resisting

quality of the red backing. The same features apply equally to the cotton materials, which are often preferred from motives of lightness and thinness. Although designed essentially for tropical wear, the fabric is equally suitable for such climes as our own, where during the excessive summer heat the necessity for an efficient sun-repellent fabric is experienced. Moreover, it is adaptable to either summer or winter wear; for, while it keeps one beautifully cool in the former, it constitutes a warm fabric in the latter season. Being of stout texture, it has excellent wearing qualities, and is thus highly economical. Again, in addition to its sun-resisting powers, it is showerproof—an important consideration in the tropics, where often torrential downpours suddenly overwhelm one. It is suitable for either ladies' or gentlemen's clothing, and can be obtained in an extensive range of colours from black to white. The successful realisation of this novelty should be warmly appreciated, especially by tropical residents, who, having hitherto suffered somewhat from an unavoidable limit of materials suitable for wear in their particular locality, can now secure all the latest creations raging in the fashionable centres of the world; while the fact that 'solaro' has been sealed at the Colonial Office for officers appointed to the tropics is conclusive testimony of its scientific efficiency.

REVERSIBLE STEAM TURBINE.

Though the steam turbine as a means of marine propulsion has come into extensive vogue, it is still in its infancy; and, although it is highly efficient, its ultimate perfection is an absorbing problem in mechanical engineering circles. The present engines of this class possess one salient drawback—they cannot be reversed; and as in order to ensure this movement an extra unit has to be incorporated expressly for astern work, it will be seen that the disadvantage is somewhat important. It means that whether travelling forward or astern a certain proportion of the plant remains idle. This defect, however, it would appear, has now been overcome by the invention of a Scottish engineer, Mr John Ogg, who has built a model engine of this class which can be driven either forward or reverse at will. In this invention a metal disc is mounted upon a hollow shaft which is perforated by a series of radial channels extending from the shaft to the periphery of the wheel, the holes widening as the circumferential edge of the wheel is approached, so that the steam in passing through from the hollow shaft may expand. As the steam issues from these channels or nozzles it impinges against blades fixed to the rim of the wheel, causing it to revolve together with the shaft. The same shaft can be fitted with several such wheels, which may be so arranged as to travel in the forward or reverse direction as required. Within the hollow shaft slides a tube which acts as the valve governing the admittance of the steam to the wheels, so that it can be brought to bear upon either the reverse or forward revolving discs and their blades, while the quantity of steam thus permitted to pass into the nozzles can be adjusted by the rotation of the inner sleeve, such action opening or closing the apertures of the nozzles. The invention has been submitted to severe tests in a model; but it is yet too early to express any decisive opinion upon the efficiency of the system, since working with a model and working with a full-sized unit are vastly different, as every engineer fully realises.

RAMBLES AMONGST THE MINOR ANTIQUITIES OF LONDON.

Mr W. S. Campbell, in his book *The Passer-by in London: a Tribute to Wren, Gibbons, and John Stow* (Chapman & Hall), has done well in drawing attention to the wealth of interest connected with the almost unheeded minor antiquities of London, which the writer calls the most wonderful and interesting city on earth. The interesting churches spared by the great fire of 1666 are in the north and east, and receive more or less notice. Illustrations from photographs are given of all the spires and towers of Wren's churches, of the work of Grinling Gibbons, the Banqueting-Hall in Crosby Hall, hidden statuary, and some ancient doorways. Amongst the churches which receive extended notice are St Bartholomew the Great, with its fine Norman work; St Helen's; St Katherine Cree; St Giles' (Cripplegate), which has associations with Milton; All-hallows (Barking), containing the most perfect and interesting brasses in any London church; St Olave's (from the towers of which Pepys watched the great fire of London), Hart Street; St Etheldreda, St Ethelburga, St Andrew Undershaft, and the Dutch Church (Austin Friars). St Saviour's is rich in tombs of poets, including John Gower, Massinger, Fletcher, and Edward Shakespeare (brother of the great dramatist). Relics of Roman London, such as London Stone and a Roman bath, also receive notice, and a numbered sketch-map will assist the intending visitor.

A HYGIENIC FLOOR-CLEANSER.

The difficulty of maintaining floor-surfaces, whether bare boards or covered with linoleum, in an absolutely clean and healthy condition, especially if submitted to much traffic, is only too well known to the housewife. A considerable quantity of dirt, despite the most elaborate precautions, is bound to be brought in upon the boots, while at the same time the flooring constitutes an excellent collector of dust. In this way the floor acts as an admirable repository for disease-germs, in the conveyance and distribution of which dust is one of the most fruitful mediums. Any means, therefore, by which this difficulty can be easily and cheaply overcome would win the warm admiration of the housewife. For such work a specially compounded liquid called 'dustolio' has been devised, and it can be applied to the bare boards, linoleum, or other covering with equal success. Its object is to

prevent the formation of dust and to maintain the flooring in a perfect hygienic condition. It is odourless; but, owing to several powerful disinfecting agents entering into its composition, it is a valuable and efficient germicide, such virulent bacteria as typhoid, dysentery, diphtheria, and enteric-fever being rendered completely innocuous after submission to the medium for about thirty minutes. The liquid also acts as a preservative to the flooring surface, dispensing with scrubbing after its application, it only being necessary to resort to sweeping with a hard broom at regular intervals. Moreover, it acts as a preservative to the flooring material. In city offices, where traffic during the day is considerable, 'dustolio' should prove of great service.

CATCHING THIEVES BY ELECTRICITY.

A police electrical appliance has just been introduced at Rio de Janeiro which is likely to prove so useful in the maintenance of law and order that it will sooner or later be installed in all important towns. It is an improved system of signalling such as may be seen in some of our public buildings, and is of invaluable service to the fire-brigade as a fire-alarm, to the ambulance and hospitals for announcing when and where accidents occur, to the police, and also to the public at large. At different street-corners throughout the town five hundred and eighty call-boxes similar to our fire-alarms have been erected. These are connected by electricity with the central police station and branch offices. For these call-boxes the citizens have numbered keys, which number corresponds with the name and address of the owner. By this means all possibility of misuse is prevented, for once the door of the call-box is opened the key cannot be removed again except by a policeman, who carries a special key for releasing the mechanism, so that he knows exactly who is responsible for the call. As soon as the key is put in the lock the signal is given at the central station by means of an electric bell and by the simultaneous lighting of a red glow-lamp, so that the official in charge knows at once on which line the call is made. A strip of paper in the receiving apparatus registers the number of the call-box, also the time at which the call is made. This message is at once forwarded to the office in the particular district, or, if necessary, it may by the mere turning of a lever be passed on to all the offices on the system. The time occupied in this is from fifteen to twenty seconds. A policeman is then sent from the office in the district from which the call has come. He learns the reason for the call, and inside the call-box there is an indicator which he places on the word on a dial, thereby informing the head office what is wrong. On this dial are such words as 'Ambulance,' 'Fire,' 'Police,' and such like. It naturally follows that, as the central office is in connection with all these different departments, the necessary help is immediately forthcoming. The same instrument also serves as a control for the police on duty, as there is a clockwork arrangement for recording the time at which they pass the call-boxes in their district.

THE FINE ART OF GARDENING.

Those who wish to know how best to plant and maintain a flower-border with a good scheme of colour will find all the help required in Miss Gertrude Jekyll's *Colour in the Flower-Garden* (*Country Life*, Limited). The writer recommends certain borders for certain times of the year, each one to be bright for from one to two months. What is here recommended is the result of observation and experience, combined with native good taste; and the writer shows herself an artist capable of using plants so that they shall form beautiful pictures. In Miss Jekyll's own private garden, we are told, something quite simple and devoid of complication is aimed at, only one or a few things being carefully placed so as to avoid fuss and give ease to the mind. In many cases, her aim has been to show some colour combination, without regard to the other considerations that go to make a more ambitious picture. Her garden is her workshop, private study, and place of rest. Planting for summer and winter colour is dealt with under the different months; and the arrangement for the fruit-garden is also explained. The pictures are exquisite studies from nature and in the art of making an attractive flower-garden.

A NEW SANITARY PAVING.

Among the various problems which confront our municipalities and rural authorities, the most pressing is in connection with the maintenance of our roads. The development of high speed and heavy vehicular traffic due to the perfection and expansion of motor haulage has rendered it necessary that improved materials of a higher degree of strength should be used. In the towns and cities either wood paving or asphalt is most generally adopted; but the former has a short period of life, while the latter, though giving an excellent surface, is very expensive. Granite setts, while durable and strong, have the disadvantage of being noisy and uncomfortable for traffic, as those who have lived and moved in areas where they are in use are only too painfully aware. Macadam, on the other hand, is very serviceable, but unless given a solid and perfect foundation is apt to wear uneven; while, moreover, it rapidly disintegrates and produces considerable dust. Recently attention has been centred in a new material which is being exploited for this purpose, and the searching tests to which it has been put both in this country and on the Continent have been attended with eminent success. It comprises the utilisation of natural mineral asphalt rock crushed to powder and then fashioned into briquettes or blocks similar in appearance and size to the familiar wood-paving. The possibilities of this material were advanced by scientists nearly a century ago, but its utilisation has not been taken seriously in hand until recently. It is a

pure limestone impregnated with mineral bitumen, and is to be found in abundant quantities in several places on the Continent. The rock is brought to this country in large masses just as quarried, and treated at the extensive works that have been erected for the purpose on the banks of the Thames. The rock is passed through powerful crushers, which pulverise and grind it to the consistency of fine sand. The product is then combined with other substances, the nature of which is a secret, and the ultimate product is then fashioned into the designed shapes and sizes, the blocks being submitted to a pressure of some two hundred tons. This last process renders the material absolutely impermeable, neither water nor oleaginous fluids having the slightest effect upon it, while it is extremely tough in texture. The blocks are laid in the usual manner, and the surface presented to traffic is smooth, clean, and quiet. While a little more expensive than macadam, it is cheaper than asphalt, can be more easily replaced, and does not offer such difficulties as the latter when it is desired to break up the roadway to gain access to pipes and so forth buried beneath. It is as hygienic and as clean as asphalt, costs practically nothing for maintenance, and collects but little dust, the saving effected in sweeping alone being a substantial item. As it affords a smooth, even surface, traffic can be maintained without any vibration or appreciable noise.

METALLIC WALL-PAPER.

A new decorative material which should have a wide application, especially for the ornamentation of ceilings, dados, and so forth, has recently been perfected. It is described as metallic wall-paper, but such a title is somewhat ambiguous, inasmuch as it is possible of confusion with that paper in which the metal effect is obtained by an application of metallic paint, whereas it actually comprises a very thin sheet of metal, so that the metallic surface is absolutely genuine. The fabric can be obtained with either the usual flat or embossed and stamped surfaces. It is electrically produced in continuous lengths, and at a price which compares favourably with the other decorative fabrics on the market. It is made practically in one operation from the crude metal, and is actually a very thin though stout sheet of metallic foil, preferably of copper, though in order to secure various contrasting effects other metals can be combined with the former. The foil can be obtained with a paper backing, in which case it is applied to the wall in the usual manner, or otherwise, and in this instance a special cement is used for securing adhesion to the wall or ceiling surface. The new material certainly possesses many recommendatory features, the most important of which are that it is damp-proof, fireproof, and sanitary, and capable of withstanding considerable rough usage. For damp walls, which so rapidly play havoc with ordinary wall-papers, it is pre-eminently suited, especially in the unbacked condition, since the cement employed ensures perfect adhesion, which otherwise would prove difficult. The effects produced by this new process are very striking and beautiful, it being possible to secure the textures of some of the finest and most delicate fabrics, and when hung it has an effective appearance. It should certainly have a wide vogue for decorating the interior of railway carriages, though owing to its variety it is applicable to any purpose for which wall-paper is at present used.

A 'BRIDGE' FISH-PLATE RAIL-JOINT.

An important though simple invention has recently been perfected by a railway engineer, the object of which is to secure an improved and stronger fish-plate joint for the rails. The ordinary fish-plate is merely inserted in the channel of the rails and bolted firmly thereto. The consequence is that the rail-ends are subject to heavy wear and tear, being deflected under the weight of passing trains, and at the same time tending to tilt the sleepers immediately contiguous to the joint. In the new idea the fish-plate assumes the form of a bridge, either end resting firmly on the table of the chair holding the rails. The only alteration required is a slight widening of the chair-table in order to carry the ends of the plate, upon which it beds fairly and evenly. The advantage obtained is that when weight is applied immediately upon the rail-joint, it is transmitted to the sleepers on either side. Deflection of the rail-ends is thus reduced, and consequently there is less wear and tear, while the sleepers have no tendency to tilt. The joint has been subjected to prolonged tests upon one of our railways, and the saving in wear and tear more than compensates for the slight expense entailed in the modification of the existing chairs used at these points.

RECENT DEVELOPMENTS IN METALLIC-FILAMENT ELECTRIC LAMPS.

The metallic-filament electric incandescent lamp, owing to its economical consumption of current, combined with increased lighting intensity, has come into extensive popularity. The one great objection, however, is the necessity, on circuits where the current system exceeds one hundred and twenty volts pressure, to link two or three lamps together in series. Moreover, should one lamp of such a combination break or become unfit for use it is necessary to renew the others, although possibly they are perfectly sound. In this manner, not only is the initial outlay for lamps a high one, but modifications in the fittings have to be carried out, and there is a probability of one accumulating a stock of partially used lamps. Under such circumstances it was thought that the evolution of a lamp applicable in single units of two hundred to two hundred and fifty volts would be a decided encouragement to the utilisation of electric lighting, and this inventive effort has at last been produced. The filament of these new lamps is a combination of tungsten and other metals, and they range between seventeen and forty candle-power from one hundred to one hundred and

thirty volts, and from thirty-four to forty candle-power in the two hundred to two hundred and fifty voltages. The light emitted is an intense white of great brilliancy, and the filament being of greater strength than the majority of such it can withstand harder usage, while it does not soften to a very great extent under the heat. Its life is one thousand hours, and the light emitted is constant up to the end of that period. In view of the fact that the mains of our electric light companies, both municipal and private, supply current at a pressure ranging from two hundred to two hundred and thirty volts, the cutting down of the lamp-bill by 50 to nearly 70 per cent. is an important stride in the popularising of the metallic-filament lamp, and will certainly act as an encouragement to those contemplating a change from the old carbon lamp, more especially as greater economy still is practicable.

A MOSQUITO-TRAP.

All those whose lot unfortunately casts them in regions where the mosquito thrives fully realise the ravages of this pest and the discomfort experienced from their attacks—not taking into consideration any maladies, such as malaria, which they disseminate—if proper precautionary methods are not practised. A simple and inexpensive little trap which Mr Maxwell Lefroy, of the Indian Entomological Department, has devised and found highly effective is a distinct acquisition to every tropical residence. It is a small box some twelve inches square and nine inches wide, fitted with a hinged lid provided with a small orifice, over which moves a sliding cover. The box is lined with dark-green baize, and has a tin floor. The trap is placed in a shady corner of the room, and the mosquitoes upon entering the house in the morning seclude themselves therein to escape the sunlight. When the insects have duly settled, the lid is shut and about a teaspoonful of benzine injected into the box. Within a short time the flies succumb. Mr Lefroy continued this process daily until the mosquitoes ceased to be troublesome, and within thirty-one days he caught and killed over two thousand three hundred of these insects.

BITUMEN DAMP-COURSING.

Old customs die hard, and, despite the scientific enlightenment of the present age, there are many who still cling tenaciously to the old order of things. This conservatism is probably more marked among architects and builders than in any other profession. A striking example is the prejudice against any improvement upon the use of slates for damp-courses. Yet it is possible to secure a far more reliable and durable medium for this purpose, vitally important as it is. The latest of these is the application of bitumen, whose damp-resisting qualities in its pure form are well-known to every electrical engineer. In the new invention the damp-course comprises a layer of finely woven steel wire-gauze embedded in the bitumen. No apprehensions concerning the possibility of the steel wire corroding need be entertained, owing to the moisture-insulating material completely enveloping it. The probability is that such an article is far more efficacious than the obsolete practice so generally followed.

FRUITS AS ELECTRIC ACCUMULATORS.

'Electricity is life' is a hackneyed aphorism, but nevertheless one that, according to the researches of a recent investigator, possesses more than a grain of truth. According to this authority, plants and vegetables are nothing more nor less than small electric accumulators, possessing, it is true, only a small unit of electric energy, but which at the same time can be conclusively detected by means of a suitable sensitive instrument. He has found that all fruits, whether of solid flesh like the apple, or composed of a number of cells like the orange, are duly replete with what corresponds to the positive and negative plates of a storage-battery. For instance, in the apple the fleshy portion constitutes the positive, and the core divided or insulated from the flesh by a thin skin is the negative, cell, the respective terminals being the flower-end of the fruit and the stalk. In the orange, on the other hand, the successive divisions form alternately positive and negative cells, insulated from one another by the skin-walls, while the whole is completely insulated on the outside by the peel or rind. To substantiate his thesis, the investigator secured an extremely sensitive Kelvin galvanometer, the magnetic reflecting indicator of which is so light as to be suspended by a single strand of a spider's web. By means of this apparatus he was able to deflect the needle from one side to the other according to the connection of the stalk or flower-ends of the fruit with the instrument, and that such movement was not attributable to chemical agency is borne out by the fact that by reversing the terminals of the fruit reversal of sign was obtained. Again, such deflections were not merely temporary; they lasted until either the insulation of the fruit was broken down or decay had set in. He also found that decomposed fruit had no action upon the instrument, but only that in which life was still extant. From such a result one can only conclude that vitality and electricity are synonymous, and that when one partakes of vegetable or fruit one, in reality, absorbs a certain proportion of electric energy into the system.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

'TUESDAY, *April* 14*th*.

'Miss Josephine Tapscott.

'DEAR MADAM,—We shall be obliged if you will kindly call at these offices to-morrow (Tuesday) between the hours of ten and eleven A.M. on a matter of great importance to you.—Yours faithfully, ROBERT F. STETLOW.'

I.

MISS TAPSCOTT sat down suddenly—in a sort of collapse of despair—crossed her two shaking, work-hardened hands on the edge of the table, laid her tired old head upon them, and her shoulders gave one or two sharp, convulsive heaves.

'I suppose I'm about due to give up,' she said forlornly. 'I've worked and worked, and fought a losin' battle for nigh on to thirteen year, but I reckon I've come to the end at last. It'll be the landlord or the butcher a-suin'—or mebby both—and dear knows where in the world I'm goin' to git the money to pay 'em.'

A little gush of tears—the first she had shed in many a long year—brought the soliloquy to a close; and, half-angry with herself for the momentary weakness, she got up and bustled about the kitchen, making a pretence of working, as if to deceive herself. Not that there was much sense in attempting to do either, when it comes to that. Because, for one thing, she couldn't blunt her consciousness of the existing evil if she tried, and, for another, there wasn't any work left to be done, since Miss Brady the showroom model and Miss Stevens the typist had had their breakfast and gone off to business a good hour and a half ago; and, at the present time, these two young women represented all the boarders of whose patronage Miss Tapscott could boast.

A quiet, self-contained maiden lady, coming from somewhere down in Cornwall—and bringing with her all the wonderful arts of cookery and housekeeping for which that county is well known—there had been a time when Miss Tapscott was a power in her small way, and her select Boarding-House for Young Women filled to overflowing, while applicants waited three deep for any chance vacancy that might occur. But the removal of the paper-box factory, from which she drew her *clientèle*, and, finally, the opening of bigger and more up-to-date boarding-houses—where they took young men as well as young women, a thing Miss Tapscott would never do—had cut into her custom and clearly proved that not all the delicious turnovers, pasties, &c., of which she was justly proud, were of the least avail against the charm of nightly dances in the parlour with masculine partners, a Saturday night 'hop' once a month, and a landlady who didn't care a fig whether you were indoors every night at nine o'clock or not.

So the Tapscott following dwindled and vanished, and hard times knocked audibly at Miss Josephine's door. For she had always been scrupulously exact in the matter of giving full value for money received; and this principle left very little reserve to fall back upon in time of need—so little, in fact, that there was nothing to spare for replenishing worn-out articles as time took its toll of them; while the suggestion of moving into a more promising neighbourhood—where new ones would *have* to be supplied, and where none of her carpets and none of her blinds could be relied upon to fit—simply wouldn't bear thinking of for a moment.

But if her fortunes failed, her conscience didn't, and she simply couldn't bring herself to cut down expenses by diminishing either the quality or the quantity of the food she set before her boarders; and as retrenchment had to be made somewhere, she diminished both the quality and the quantity of her own instead, dismissed her servant, took double work on her own shoulders, and went on struggling and pinching and starving and hoping, and never wholly lost heart until to-day.

 [*All Rights Reserved.*]

'Well, I suppose I've got to face it, whatever it be,' she said forlornly, as she put the broom behind the door, hung her apron upon its accustomed peg, and spying a few crumbs under the table, brushed them carefully up and put them in the coal-scuttle. 'I'd a liked to hev' made jist enough to go back to the country and end my days there in peace, for I've had a pretty hard life of it, takin' it all in all. But it seems like 'twarn't to be; and if only I ain't drove to the workhouse'—— Her voice choked up and her lips twitched. *That* was a possibility that wouldn't bear thinking over.

As briskly as she could she put on her hat and wrap and her outdoor shoes (which were *very* thin and worn), locked up the house, and sallied forth afoot to the offices of Messrs Stetlow, Barnes, and Burns; for, although the walk was long and the morning was wet, expending twopence for bus-fare was an extravagance to which she dared not rise.

It was close on ten o'clock when she arrived at the far end of Lincoln's Inn, and, with a sinking sensation about the heart, opened the door and crept guiltily into the outer offices of Messrs Stetlow, Barnes, & Burns's establishment, and made known her business by extending the senior partner's letter and saying to the clerk who came forward, 'I've come about this. Be the gentleman in, or hev' I come too early? It's worried me a good deal, and I thought I'd better git it over as soon as I could.'

'Ah, yes. Step this way please,' replied the clerk, opening a door and ushering her into a sort of waiting-room. 'Mr Stetlow is engaged just now, but he'll see you presently. Would you care to look at the morning paper while you are waiting?'

'I don't think I could read it if I tried,' admitted Miss Tapscott with unconscious pathos. 'I'm too nervous and upset, I'm afraid. But thanky all the same. I suppose you couldn't tell me whether it's Mr Slinks the butcher or Mr Havens the landlord that 's a-suin', could you? It 'u'd sorter relieve my mind to know.'

'I haven't the faintest idea,' replied the clerk, with the calm indifference of his kind. 'Sit down, please, and as soon as Mr Stetlow is disengaged I'll tell him you are here.'

Then he went out and left her, and shut the door behind him; and, in a state of trembling nervousness, Miss Tapscott sat down on the very edge of one of the big leather-covered chairs, squeezed her hands together hard, and waited. And so she was still sitting and still waiting when, at the expiration of twenty minutes, he came back, and, with a serene 'Step this way, please,' opened another door and ushered her into Mr Robert Stetlow's presence.

He was a large, sunny-faced, portly man of middle age, so utterly unlike Miss Tapscott's idea of what that dreaded individual a lawyer must be that she took heart of grace, and in response to his cheery 'Good-morning, Miss Tapscott; pleased to see you,' fired the burning question at him point-blank: 'Be it Mr Slinks or Mr Havens that 's a-suin'?' she inquired tremblingly. 'Whichever it be, I don't know how I'm goin' to pay 'em till times gits better; I don't, indeed, Mr Stetlow. But mebby it 's both of 'em a-suin' together? Is it?'

'Quite to the contrary, my dear madam,' responded Mr Stetlow cheerily. 'You haven't been brought here in reference to a lawsuit, but in the capacity of a beneficiary.'

'A which?' said Miss Tapscott, wrinkling up her brows in a puzzled way. 'I'm afraid I don't jist understand.'

'Remember having a lady named Berkenshaw boarding with you some seven or eight years ago—a Mrs Martha Berkenshaw?'

'Law! yes,' replied Miss Tapscott. 'A widdler lady she was. Come from somewheres up in Yorkshire, lookin' after a niece of hers—her dead sister's darter as she'd lost sight of. She was took with pneumony while she was a-boardin' with me, and I nursed her. She had an awful time. I thought once she was goin' to die, but she pulled through.'

'Owing to your careful and tireless nursing.'

'Well, I can't say as I ever thought *that*.'

'She did, however,' said Mr Stetlow, 'and she has done her best to prove it. She had a house and some property in Yorkshire, Miss Tapscott, when she died six weeks ago; and, in return for your kindness to her, she has left you half of her possessions, together with the sum of one hundred pounds in ready money, and you've been summoned here this morning to receive it.'

For just one moment Miss Tapscott stood and looked at him with wide, unwinking eyes, then she sat down and put both hands over her face and made a queer little sound far down in her throat.

Not a lawsuit, but a legacy! Not the workhouse, nor yet the dreaded mysteries of a court-room, but the dream of her declining years come true—a house in the country, with the green fields, and the flowers, and the birds, and the fruit-trees; a house in the country that was *hers*—her very own property!—and, added to that, one hundred pounds in the bank! The reaction was so great that for a moment she trembled on the verge of crying.

'You're sure I'm wide awake? You're sure this ain't all a dream?' she said doubtfully, uncovering her eyes and looking up into Mr Stetlow's face. 'You're sure it's really mine?'

'Quite sure,' he answered. 'Yours and her niece's together. You are co-legatees. There's a fine, large farmhouse and twelve acres of land, and you and Mrs Thorburn are to share and share alike.'

'Mrs Thorburn! Who's she?'

'Mrs Berkenshaw's niece. She married against her aunt's wishes, it appears, and they were estranged shortly after coming together. But the old lady seems to have repented at the last and linked her name with yours in her will. I am expecting Mrs Thorburn here every minute with her little boy. She is a widow. Her husband died three months ago and left her in rather straitened circumstances. She has been supporting herself and her little son by giving music-lessons since Mr

Thorburn's death. She is not in very good health, although she is young and extremely good-looking. You will like her and her little boy, I am sure.'

'I ain't fond of children and I detest *boys*,' said Miss Tapscott with an amount of bitterness which made him arch his brows and look at her in surprise. 'I don't care for young widders nuther. I never would take one in to board even in my hardest times. And a young widder with a *boy!* I hope she won't want to live in the house. I hope she'll rent me her part. I want to live alone. I couldn't stand a boy. Boys is only men getting ready to grow up; and I hate men! I wish I'd never seen one—I wish I'd never hev' to speak to one again to the day of my death!'

Mr Stetlow suppressed a whistle.

'Forty-five, if she's a day,' was his mental tally. 'With an incipient moustache, a face like a hatchet, feet like a grenadier, and yet—she's had a romance! God bless us and save us! what kind of man must the fellow have been, when, according to her own showing, she didn't even have money to gild the pill?'

His reflections were cut short by the sound of a piping, childish voice, mingled with the rustle of a woman's skirt, which proceeded from the outer office. He turned sharply to the door, opened it, and held out a welcoming hand.

'Ah, good-morning, Mrs Thorburn,' he said. 'I thought I recognised our young inquirer's voice.—Well, Master Want-to-know, found out yet "what makes pussy-cats *boil* when you stroke them?"—You are just in time, Mrs Thorburn. Allow me to have the pleasure of introducing you to your co-legatee, Miss Josephine Tapscott.'

Miss Tapscott, who had sat silent and motionless, with her eyes moodily fixed on the floor, glanced up. A young and radiantly lovely woman, with fair hair and blue eyes, was standing before her arrayed in widow's weeds, and extending a small kid-gloved hand in smiling greeting. A little knot of violets was on her breast, and a boy of between four and five years of age was clinging to her skirt.

'Indeed, I am glad to meet you, Miss Tapscott,' said the young widow in a singularly musical voice. 'In the days before I offended her by—by marrying Walter, my aunt used to speak often of you and your kindness to her when she was so very ill. This is my little boy, Miss Tapscott.—Wally dear, say "Good-morning" to Miss Tapscott, and tell her you are pleased to meet her.'

'Dood-mornin',' said the child obediently. 'Pleased meet you.—Oh, mummy dear, did all those funny 'ittle curls over her ears grow like that?'

Mr Stetlow diplomatically clapped his hand over the young questioner's mouth and drew him away.

'Come here and see what's in this box, you young reprobate!' he whispered with a suppressed laugh. 'That inquiring mind of yours is likely to upset the whole apple-cart, bless your pretty eyes!'

'Please forgive him, Miss Tapscott,' said Mrs Thorburn, blushing with mortification. 'He's only a baby. He doesn't mean to be rude. I am sure you will learn to love him when you get to know him better.—Don't you, Mr Stetlow?'

'Humph! a reg'lar man-trap! Won't hev' one around unless he's dancin' attendance on her,' commented Miss Tapscott mentally.—'I'm not partial to children,' she said aloud, as she laid the tips of her fingers in the extended hand and let them slip away again—a mere compromise with the laws of etiquette. 'And boys in partic'lar I can't abide. I'd ruther live alone, if it makes no difference to you, and I was jist sayin' to Mr Stetlow when you come in that I wondered if you'd mind rentin' your share of the house to me. I don't think me and you and that boy 'u'd be altogether comfortable livin' together, and if you and him 'u'd like to live summers else'——

'Oh, Miss Tapscott! please don't suggest it,' said Mrs Thorburn with a frightened look in her soft eyes. 'If you knew what it means to me I am sure that you wouldn't. I—I am not strong. My lungs are weak, the doctors tell me, and I must get out into the fresh air of the country as soon as possible. If anything were to happen to me what would become of my baby-boy? He has only me in all the world, Miss Tapscott, and if I were to be taken from him—— Oh, I am so sorry, so sorry! I thought we should be such company for each other.'

Even Achilles had a vulnerable spot in his heel; but whether Miss Tapscott's was in her heel or her heart, no matter, she weakened.

'I don't want no "company,"' she replied grimly. 'But I ain't one to stand out when it's a question of a body's health. So, as you don't want to give up the house, and I don't nuther, I reckon the best thing we can do is to partition it off even; you live in your half and I live in mine, and no interferin' one with the other. If that's agreeable, all that's left is to decide which half you'll take and which half I'm to hev'. I ain't never seen the place. Hev' you?'

'Yes,' replied Mrs Thorburn. 'I was there yesterday. I think I should prefer the east side; but that wouldn't be wholly fair to you, because all the roses grow on that side, and I love roses—they were Walter's favourite flowers.'

Miss Tapscott's face set squarely and hardened.

'I hate 'em!' she said with exceeding bitterness. 'The very sight of 'em makes me sick, and I wouldn't trust a man who was fond of 'em as far as I could throw him. I never knowed but one man who really and truly loved 'em, and he was the vilest human critter that ever lived. In jail this minute, if he's got his just deserts. You kin hev' the roses if you want 'em—I don't. I'll take the west side for mine.'

So the matter was settled; and, after lingering a while longer to arrange all preliminaries in the way of signatures, &c., and with a cheque for fifty pounds in her pocket to defray the expenses of the dividing partition, Miss Tapscott left the offices of Stetlow, Barnes, & Burns with a step that was positively elastic. Her first duty was scrupu-

lously to settle all her bills and to obtain release from her landlord by paying a small bonus, then to gather together such of her household gods as she wished to retain, and send them to Yorkshire, selling the rest to the second-hand dealers for what they would bring; and two days later the farm-people passing in the neighbourhood of the late Mrs Berkenshaw's house were treated to the spectacle of an alert, shrill-voiced female superintending the erection of a high board-fence which completely divided house and grounds into two even sections from the front gate clear down to the rear boundary-wall.

On the east side of this dividing barrier clustered all the rose-bushes the place boasted, thick with green promise of leaf and flower; on the west, apple and cherry trees frothed with opening blossoms the tender foliage of arched boughs and spilt flecks of pink-and-white on the rolled walks and the close-cropped grass; and under that living arch walked from dawn to dark—as though she couldn't get enough of God's free air and sunshine—the little old maid who for nearly thirteen years had drudged and suffered and worn her life away between the four dreary walls of a London boarding-house.

(To be continued.)

THE STORY OF SOME BURNS RELICS.

By Robert Duncan.

THE dissatisfaction which has lately been expressed north of the Cheviots at the exclusion of 'Burns' from the great names in English literature inserted in the panels of the dome in the British Museum recalls the fact that in that Museum lies one of the most interesting mementos of the National Bard—namely, his famous punch-bowl. The present, therefore, is an opportune time to tell the story of how this important relic of the poet came to go outside his native country, and of the energetic efforts which were made in the early sixties of the last century to get it transferred to the Burns Museum in Edinburgh. The attempt to bring the bowl back to Scotland was of a semi-private nature; but as most, if not all, of those engaged in it have joined the great majority, the silence which was imposed upon the principals at the time may now be broken and the particulars given to the public.

Readers of Burns will remember that the punch-bowl was presented by James Armour to the poet when he married 'bonny Jean' *in facie ecclesiæ*, and took her with him to Ellisland. It was made by Armour himself out of *lapis ollaris*, the stone of which Inveraray Castle is built. This species is of a greenish-gray colour, and would doubtless be selected by him on account of its being easily worked and turned in the lathe. Armour has been described as a man rigid and devout; but the character of his gift shows that he neither lacked the social qualities of the times nor looked askance upon the jovialities of his famous son-in-law. And round the bowl hangs the memory of many merry meetings, for Burns frequently loved to assume the bright cloak of happiness and hilarity with the view of hiding from the world his disappointments, his difficulties, and his doubts. Here is his general welcome:

> But ye whom social pleasure charms,
> Whose hearts the tide of kindness warms,
> Who hold your being on the terms,
> 'Each aid the others,'
> Come to my bowl, come to my arms,
> My friends, my brothers!

Vive la bagatelle! was at these times his motto, with Venus as Queen of the Revels. From all these, however, there outstands the historic gathering at Laggan, when

> Willie brew'd a peck o' maut,
> And Rab and Allan cam' to pree.

William Nicol—a bosom-companion of Burns, but one whose influence upon his life was perhaps not of the best—had purchased the small estate of Laggan, which adjoined the farm of Ellisland. Burns and his friend Allan Masterton, who was then on a visit to Dalswinton, determined to call on him and to celebrate his acquisition of the property by having a 'house-heating.' So the poet, armed with his punch-bowl, and Allan, full of melody, crossed the Nith, and arrived at their destination a 'wee before the sun gaed doun.' It is almost needless to infer that Nicol would receive the pair with open arms, and that the three kindred spirits, endowed with all the elements for a merry-making, would resolve to make the meeting a memorable one in their lives; the time and the circumstances were irresistible, and the immortal song evoked by the occasion shows that their performance was even better than their resolution. Nicol, with his accustomed skill, brewed a potent and plentiful supply of punch, Burns told his queerest tales, Allan sang his sweetest songs, and the 'three merry boys' did not disperse until the day had dawned and the morning sun gleamed upon the hills of Laggan.

On the death of Burns the punch-bowl was presented to Alexander Cunningham, the father of Allan Cunningham, one of the numerous biographers of the Bard. After the death of Alexander Cunningham, the bowl, through the instrumentality of Mr A. Dobie of Lancaster Place, London, came into the possession of Mr Richard Hastie of Rutland Gate, London (who for some years was the parliamentary representative for Paisley), probably through the medium of an auction sale, regarding which the *Edinburgh Advertiser* of 9th

January 1816 had the following announcement by a bookseller and auctioneer:

'THE PUNCH-BOWL OF ROBERT BURNS.

'Mr Ballantyne has a melancholy satisfaction in announcing to the British Public (for the admirers of the Bard may not admit a narrow appellation) that circumstances have brought the above interesting Relique of the immortal BURNS to sale by Public Auction.

'The authenticity of the Bowl admits of no question; its worth, as the companion and memorial of Burns' happiest moments, can be duly appreciated by those only who have felt, as keenly as himself, the strugglings of his giant genius through a hapless life, and the sickening disappointment of heart —*not* arising from hope deferred, but from hope blighted, disappointed, and extinguished—which led him, at length, to this very Bowl, as his last, though most dangerous, solace. Is it to be said, while the smallest relic of our immortal Shakespeare is justly valued above all price, that this most intimate, most personal, and most interesting memorial of our Native Bard is to be the pearl thrown away? Taste and Liberality equally forbid it.

'The Sale will take place at the rooms, No. 4 Princes Street, Edinburgh, on Saturday, January 20, 1816, at two o'clock P.M. *precisely*. Orders addressed to the Clerk of Sale or to Mr Ballantyne will be attended to, according to their priority, with the most scrupulous fidelity, where the parties find it inconvenient to attend the sale.

'Princes Street, 8th Dec. 1815.'

Mr Hastie appreciated at its true worth the relic which had played such a notable part in the life of the poet, and on each 25th of January he placed it, full of the national beverage, before a select company of his friends. On Mr Hastie's death it was found that by his will, which was dated 4th June 1857, he had bequeathed the bowl to the British Museum. The bequest was in the following terms: 'I Give and Bequeath a Punch-bowl formerly belonging to the Poet Burns, together with a book of sundry manuscripts and relics of that Bard, to the Trustees of the British Museum, and I direct and authorise my Executors to take a receipt for the same from any official person connected with the Museum whom they may think competent to give such receipt.' The bequest was considered a valuable one by the trustees, and in their subsequent report to Parliament they stated that it was one well worthy of public notice. It was unfortunate that Mr Hastie should have left such an interesting relic as the punch-bowl to an institution outside Scotland. There is reason, however, to think that he may have been moved to do so by the fact that there did not exist at the time any body in Scotland which looked after the relics of the Bard. But the great centenary celebrations in the year following Mr Hastie's death aroused intense interest in the poet and his works, and it was therefore not surprising that a short time afterwards successful efforts were made, through the medium of the Edinburgh Burns Club, to collect many valuable mementos of the poet, which were then placed in the Burns Monument, but were some years ago transferred to a separate section in the Municipal Museum at the Edinburgh City Chambers. Amongst the relics which could not be recovered was the punch-bowl, and it was felt that an effort should be made to obtain it from the Trustees of the British Museum. Accordingly, after some preliminary negotiations, Sir Roderick Murchison, at a meeting of the trustees in February 1864, carried a motion that the punch-bowl should be transferred to the Edinburgh Burns Monument collection, on condition that the Burns Club sent to the trustees for their MS. department a letter or letters of the poet. It transpired at the meeting that the rules and regulations of the trustees distinctly forbade them from parting with any object confided to their care either by gift or on loan; but Sir Roderick happily brought before them their power to exchange objects on special occasions; and it was decided that this was a fortunate way out of the difficulty. Much satisfaction was naturally felt when it was known that the bowl was to be brought to Edinburgh, particularly when the trustees' resolution was followed by a formal intimation from Mr Antonio Panizzi, the principal librarian, confirming the news. A MS. letter of Burns was accordingly sent to London to be exchanged for the bowl. But 'the best laid schemes o' mice and men gang aft agley,' and some delay occurred with regard to the question of the trustees' powers in cases of *bequests*, though it was still hoped that the special general meeting of the trustees in May following would confirm the unanimous resolution of the body to which executive power had been delegated.

By this time the hitch in the negotiations had aroused a good deal of interest in Edinburgh, and several prominent citizens joined the movement to regain the bowl, which had now assumed the appearance of a mimic international dispute. To overcome the difficulty which had been created, Mr Robert Chambers suggested that there should be raised a memorial to the trustees from men of note in the Scottish capital, and he promised not only to do all in his power, but also to procure the strong support of his brother William. A memorial in the following terms was accordingly sent to the trustees:

'Your memorialists having learned that the Standing Committee or Executive Body of your Honourable Board have agreed to send the Burns Punch-Bowl to the Burns Monument Museum in Edinburgh in exchange for any letter or letters of the Poet which the custodiers of the Monument may send to the MS. department of the British Museum; and having ascertained that Mr James Ballantine, interim curator of the Monument, has sent a letter of Burns to your Museum, your

memorialists earnestly pray that you may authorise the transaction to be concluded.

'The Edinburgh Burns Monument, of which the Town Council are the permanent custodiers, was erected thirty years ago, and cost nearly three thousand pounds, subscribed for by Scotsmen in all parts of the world. It occupies a prominent point on the Calton Hill, is a Grecian temple of chaste design, has a well-lighted chamber twenty feet diameter, and contains relics, as per annexed catalogue, all of which have been collected during the last eighteen months.

'Since the Monument was opened six months ago as a Museum, it has been visited by nearly five thousand persons, each paying twopence, so that it is entirely self-supporting and daily becoming more popular and attractive. As the Poet's Punch-Bowl would here be a prominent object, would be carefully preserved, and more thoroughly appreciated than in the British Museum, your memorialists respectfully and earnestly solicit your Honourable Board to accede to the prayer of their memorial.'

Amongst the signatories to this document were the Lord Provost (Mr Charles Lawson), Mr Adam Black, Sir William Gibson-Craig, the Provost of Leith, Lord Neaves, the Sheriff of Midlothian, Messrs W. and R. Chambers, Sir John Watson Gordon, Sir John Steell, Mr Alexander Russel (the famous Editor of the *Scotsman*), Professor Christison, and Professor Simpson. This powerful appeal from the civic authorities and so many enlightened inhabitants of Edinburgh was not without its due effect upon the British Museum Trustees, and they now deemed the matter of so much importance that a special meeting of the whole body was summoned for Saturday the 23rd of April 1864. As it was essential, in giving away or exchanging objects bequeathed to the Museum, that two of the three principal trustees should be present, the chief librarian secured the attendance of the Archbishop of Canterbury and the Speaker of the House of Commons. At the meeting the motion to transfer the bowl was strongly and heartily advocated by Sir Roderick Murchison, and he was ably supported by some of the trustees for whose judgment and character there was the highest respect. But the motion was opposed on the high principle that every bequest to the British Museum was a sacred engagement, and in this particular case it was argued that the punch-bowl formed part only of Mr Hastie's bequest, inasmuch as there accompanied it a whole bookful of the poet's letters. This plea prevailed, the amendment was carried, and the battle of the bowl ended in there being lost to Scotland a remarkable relic concerning a phase of Burns's life, which, toned down by the gentle hand of time, only serves to throw into stronger relief the great glories of his brief but brilliant career.

The British Museum contains other relics of Burns, including the MS. of 'The Cottar's Saturday Night' and the celebrated letter from him to Dr Moore, dated 22nd August 1787, in which he freely narrates the events of his life. Another English institution, the Liverpool Athenæum Library, has two quarto volumes of poems and letters. Indeed, the relics of the poet are now scattered all over the world. Many have crossed the Atlantic to swell the collections of the millionaires of America. An article in *Chambers's Journal* for 1903, upon 'The Burns Cult in America,' gave particulars of some of the manuscripts then in the possession of Mr R. B. Adam of Buffalo, including the Burns-Dunlop correspondence (which has been published) and the MS. of 'Tam o' Shanter' and 'A Man's a Man for a' that.' But the bulk of the relics of Burns are naturally located in the land of his birth, particularly in his loved country of Coila. The 'auld clay biggin'' in which he was born was, with the relics therein, acquired for four thousand pounds in 1881, 'to be preserved in the interests and for behoof of the public.' The Monument at Alloway contains the Bible given by him to Highland Mary when they bade each other a fond farewell by the banks of the winding Ayr. In the Dumfriesshire district many mementos are in the possession of private parties. The Public Library, the Crichton Royal Institution, and the Globe Tavern own several; and in the Dumfries Observatory Museum are Burns's travelling-trunk and a copy of 'Holy Willie's Prayer' in his handwriting. In Ayr is the 'Burns Press Chair,' made from the printing-press on which the first edition of his poems was printed at Kilmarnock. The Ayrshire Burns Library contains his dram-glass and rush-bottomed chair, and a copy of 'The Whistle' in his handwriting, besides Mr James M'Kie's valuable collection of all the known editions of his works. The Irvine Burns Club owns several manuscript poems, and the St James's Masonic Lodge, Tarbolton, in addition to the minutes signed by Burns, has the original manuscript of 'The Farewell' which he addressed to his companions in the craft. In the capital, the Scottish National Museum of Antiquities possesses a grim reminiscence in the poet's pair of double-barrelled pistols; and in the National Gallery is the famous painting of him by his friend Alexander Nasmyth. As already mentioned, what is probably the largest collection of Burns relics in Scotland is in the Edinburgh City Museum. To this the punch-bowl which forms the subject of this article would have been a welcome, and indeed a fitting, addition, for it was in 'Scotia's darling seat' that Burns spent the happiest portion of his chequered existence; but his metropolitan admirers have the satisfaction of reflecting that the relic reposes in the chief city of the Anglo-Saxon race, of which he is one of the foremost and most fascinating literary figures.

The Editor of *Chambers's Journal* is himself in possession of a copy of the first Edinburgh edition of Burns's Poems, containing numerous holograph notes by Robert Hogg, nephew of the Ettrick Shepherd, who for many years acted as secretary to Sir Walter Scott

at Abbotsford. The volume also contains the following lines written to an unknown correspondent:

'ELLISLAND, 16*th June* 1788.—This is now the third day, my dearest sir, that I have failed to see your physog. Come to me at once. Adieu!

'ROBT. BURNS.

'My old direction—Mauchline.—R. B.'

A final word may be said regarding other Burns relics from time to time recorded, but which cannot now be traced. From a letter written by Mr Arthur Campbell of Preston to Robert Chambers in 1843, we find that the silver snuff-box presented by Mr G. M'Iver to the poet was then in the possession of Mr Dobson, proprietor of the *Preston Chronicle*. In 1851 a Mr Hilson writes that he is owner of Burns's copy of *Junius*, and the same year Mr Hugh Macdonald of the *Glasgow Citizen* newspaper records the existence of the poet's copy of Cicero's *Orations* belonging to Mr David Robertson, Glasgow. The volume contained the following inscription in Burns's holograph: 'EDINR., 23*rd April* 1787.—This book, a present from the truly worthy and learned Dr Gregory, I shall preserve to my latest hour as a mark of the gratitude, esteem, and veneration I bear the donor—so help me God!—ROBT. BURNS.' Perhaps even more interesting was the copy of Young's *Night Thoughts* presented by Burns to Clarinda, and bearing the following inscription: 'To Mrs M'Ilhose this poem, the sentiments of the Heirs of Immortality told in the numbers of Paradise, is respectfully presented by Robert Burns.' This is followed by a note in the handwriting of Clarinda, presenting the volume to Charles Kirkpatrick Sharpe, the well-known Edinburgh antiquary. This interesting relic was sold with the contents of Mr Sharpe's library in 1851, and has not since been heard of.

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire*, *How England Saved Europe*, &c.

CHAPTER XXXIV.—THE SLAVE.

THE wild landscape of the desert, a measureless waste of low sandhills that seemed to undulate beneath the white-heat which lies upon it; no wing of bird in the white-hot sky, no blade of grass or shadow of tree on the blistered earth.

On the crest of a low ridge of sand a figure is standing, shading his eyes with his hands as he watches the horizon to the north-west. He looks a true Bedouin, lean, bare-legged, brown-faced, a cotton cloth wound about his head, a ragged *haik* his only dress. Presently a second figure, a huge negro, his face black as ebony, climbs the ridge, leading a couple of camels. The negro laughs as the Bedouin speaks to him eagerly in Arabic and points to the horizon. The black stares long in the direction to which his companion's finger points, and then he shakes his head. He can see nothing. But the keener eyes of his companion can discern in the wavering horizon, dim in the heat-haze, a patch of steady purple. He claps the negro on the shoulder.

'*Thalatta*, Sidi—*thalatta!*'

The negro laughs contentedly in reply, though he does not understand his companion's words. A strange Bedouin this that lifts up on the crest of that hill of sand the cry of Xenophon's Greeks when they saw the sea! Then the pair mount and ride away, the sand rising in white dust under every stroke of the camels' feet.

It is Jack Lawrence come back from the desert. 'He is hard to kill,' said his uncle, and this was certainly true. Nearly three years have gone by since, a semi-blind captive, plodding behind his master's camel, he disappeared in the heat-filled horizons of the great desert. He seemed to have vanished from human knowledge. In London they mourned for him as dead—all save Denise, to whom love taught, somehow, an obstinate hopefulness. And now Jack has come back out of the furnace of slavery, free, armed, unpursued, a companion by his side. He is aiming for one of the ports on the Gulf of Suez, and from the ridge of sand he had caught the first glimpse of the far-off purple sea.

The tale of his experiences as a slave would make a romance; but it was clear that slavery had set no evil mark on him as he stood erect and fearless on the sandhill. Yet there were some changes in him. The steady eyes were as honest as ever, but they had a new expression. Eyes that have looked on danger as a daily and familiar thing learn an intent watchfulness of glance no other eyes know. The face had new lines of sternness written on it. It wore the aspect of that rare strength which comes of suffering endured and conquered. It was a face that would have arrested attention in a crowd.

. . . . . .

The Arabs on their homeward journey had travelled due south, halting every third or fourth day at some little oasis, with its cluster of muddy wells. They were rich in booty, and their riches brought some perils with them. They might be plundered. They would be a temptation to every group of hungry Bedouins within a hundred miles. So Jack's captors were making for the remotest oasis in their territory, and with each day's travel the chances of escape grew fainter. To make a dash of fifty miles or so to the coast was comparatively easy. But to travel back across such

wide spaces of trackless desert needed a training and preparation not to be soon or easily got; and Jack realised that the problem of escape had taken quite new dimensions.

A weaker man might have abandoned hope; but as he lay on the sand in the dark, with the slumbering Bedouins about him, Jack studied the new conditions coolly. His natural courage was great, and somehow the thought of Denise gave it an edge of steel. He *must* get back to her! It filled him with a sort of scornful anger to think that a score of ragged and untaught Arabs should keep them separated.

He studied keenly the personnel of the band. He resolved to master their language and their methods of life. He would learn the secret of their endurance and their skill in desert-travel. Why should not the hieroglyphics of the desert landscape become as legible to him as to them? His brain, strong in the resources of civilisation, should pluck from theirs all the knowledge they held. Pride of race and civilisation stirred in him. His senses were as keen as theirs. He had a knowledge they did not possess. Why should not a civilised man outsee, outmarch, and outlast a savage?

Then his courage found a better root than even pride of race and civilisation. Did his Christian faith count for nothing? It surely put him in touch with nobler forces than any of which these untaught Bedouins had any experience. As he reflected he saw that it was a peril great and deadly that he might lose the moral qualities which parted him from these children of the desert, and sink to the morals as well as the offices of the slave. In the last analysis it was a spiritual interval which separated him from his captors, and in self-defence he must keep that interval as wide as possible.

He was in a strait betwixt two. He must show himself better than these Bedouins or become worse, and either by measureless degrees. So he clung to his religion with a new energy—the energy with which a drowning sailor in a wild sea clings to a lifebuoy. And what was his religion? He had no Bible but what stole out, in half-forgotten fragments, from the cells of his memory. How he longed for the little ragged Testament made sacred by the touch of a dead mother's hand! But Denise had it; and somehow, as he thought of it, that Testament which had passed from his hand to hers became a new link betwixt them.

It was odd what parts of the Bible he remembered and what he forgot. But what he forgot only threw into bolder and loftier relief the passages he remembered. The Bible for him, under these conditions, resembled a landscape seen through mists. Only the loftier peaks were visible. And what were these?

The one great luminous fact which that half-forgotten Bible yielded was the figure of a personal God; God not an abstraction, a Force, a stream of tendency; God as a father having personal relations with His child; God revealed in Christ and interpreted by Christ. Fragments of verses, sweet as the strain of the half-forgotten songs of childhood, awoke in Jack's memory. Bible stories too—the stories he learned as a child at his mother's knee—somehow emerged, and clothed themselves with strange meanings. Poor Lawrence found hidden messages in them. The tale of the Hebrew children unscorched in the fiery furnace—what a childish story! But did it not make visible at one point a fact which held good everywhere and always, the fact of a divine companionship with men in trouble? If so, then, was not some unseen Son and Brother of man beside him in the white furnace of the desert? So Jack got what many in happy conditions never get—a personal and verified Bible.

His religion, it may be added, fulfilled one other office which many miss in it. It gave him the constant sense of companionship. God was with him, filling all loneliness with the sense of a divine Presence. This Presence, too, was shared by those he loved and by all the saints. It became the one link betwixt himself and Denise, and it still held good when all others failed. All the dreadful emptiness of space parted them. She was beyond the reach of his senses. No touch of hand, no meeting of eyes, was possible. But here was one realm at least in which they met—a realm in which he was free and had kinship with unknown orders.

Great is the power of faith! This lonely slave in an Arab camp, lost in the solitudes of the desert, stretched his arms with exultation as he felt himself in kinship with the heroic spirits of all lands and ages.

At the back of his courage there was, it has to be confessed, one pagan element. He looked at his situation with unshrinking eyes, and realised that the worst that could come to him was death. He could die, as brave men did in battle, and not count it an evil beyond endurance. And when he had measured in this way the worst possibilities of his lot he felt almost light-hearted. Nay, he felt transfigured. The black fact of death was a door, not *out* of life but *into* life.

Jack mastered the language quickly, for he heard no other sound than it. He found what may be called the arts of Bedouin life few and not difficult to acquire. His theory that the civilised man, with the strength of a trained brain, can beat the savage in his own arts if driven to practise them was justified by the facts. He quickly learned to interpret the desert as well as the Bedouins who were born in its melancholy depths. He could bear heat and thirst and hunger as bravely as they. He grew as tireless, as quick-sighted, as patient of toil.

He taught the children of the little camp new games and told them new stories; and, as children of all lands are very much the same, he quickly

won their hearts. The blacks became docile to him. In brief, race told, knowledge told, courage of will told. But it was the moral qualities in the captive Englishman which told most of all. He acted on some better law than the rest of the camp. He somehow carried with him stronger forces. So this slave became a power in the camp.

One happy incident enabled Jack to win an influence over the old sheikh which probably saved him from some of the worst experiences of a slave's life. The sheikh, with another Bedouin, started to visit a friendly camp some three days' journey distant, and took Lawrence with him to attend to the camels. Midway on the return the two Arabs suddenly resolved to visit a long-deserted oasis nearly a hundred miles off their route.

They reached the oasis towards the evening of the third day. It was a little, sunken valley, with rocky cliffs on three sides, and a track leading down over loose stones on the fourth. As they descended, a stone on which the sheikh's camel trod slipped under its feet, and the beast fell clumsily, throwing its rider and rolling on him. The sheikh lay unconscious as Jack and Hamed bent over him. There was a deep cut in his head; one ankle was twisted; he was crushed about the chest. The camel refused to rise; but they lifted the unconscious man, carried him to the shade of the rocks, and with rough surgery bound up his wounds.

Hamed presently went off to examine the little valley, and came back just as the sun was setting. Jack could see that his face was gloomy. He examined the sheikh, who had recovered consciousness during his absence, but was now lying in a stupor of sleep. The Bedouin squatted on the sand, lit his pipe, and smoked for an hour in silence. Then he arose and went off to examine the injured camel, still lying where it had fallen. He came back and stood, the light of the fire playing on his dark face.

'Allah wills it,' he said; 'the sheikh cannot ride. I will go off and fetch help.'

He was busy for a while with his camel; then he came back to where the sheikh was lying, and took up the water-bag and proceeded to carry it away. Some impulse made Jack jump to his feet.

'You must not take that,' he said; 'the sheikh may want it. You have your own.'

Hamed dropped the bag, snatched a knife from his belt, and turned on Jack with a threatening gesture. But something in the steady look and fearless attitude of the white slave checked him. For a moment, in the light of the fire, the two men looked at each other with threatening eyes; but the stronger spirit of the white man overbore the Bedouin, and with a guttural curse he turned and walked off; and through the dark Jack heard the clatter of his camel's hoofs on the stones. In the morning the sheikh had recovered all his senses, and looked round with questioning eyes at his companion.

'Hamed is gone,' Jack explained. 'Your camel is crippled, you cannot ride, and he is gone to fetch help.'

The sheikh's face darkened. 'He has abandoned us,' he said. 'He will never return.'

Hamed did not belong by blood to the tribe. He had fled from his own clan to escape punishment for some offence, and had been allowed to remain at El Kabla. But the sheikh knew his man, and knew he was faithless. Then Jack told how Hamed had tried to carry off the water-bag of the sheikh.

'Has he taken the other?' the sheikh asked.

Jack went over to the place where the trappings of his own camel were piled, but the water-bag had disappeared. The sheikh showed no surprise at the news.

'But are there not wells here?' asked Jack.

The sheikh shook his head doubtfully.

'The fresh wells here failed. The one that remains is salt. That is why the place was abandoned.'

Jack set off to examine the wells. Three were dry, and had evidently been dry for years. He discovered a fourth, close to the foot of the cliff, but on tasting the water in it found it bitter with salt. Some saline deposit in the strata through which the water trickled made it as undrinkable as sea-water.

As Jack stood by it, with the taste of the bitter fluid on his lips, he realised the whole situation. Here were two men, one of them crippled, in the heart of the scorched desert, at least three days' journey from help, with one poor skin of water for them both. The sheikh was helpless. Why should he not mount his camel and make a dash for freedom? He would at least have a chance of escape, while to stop was to perish. He came back to the sheikh, and told him what he had found. The sheikh looked at him with suspicion.

'You will leave me,' he whispered at last, 'like Hamed.'

'No,' said Jack.

'Why should you not?' said the sheikh sullenly. 'It is fate.'

'Hamed may come back yet,' Jack argued; but in the look in the sheikh's eyes was a sufficient answer.

Jack stood thinking over the situation. To stay was to die. His camel was poor, but at least it gave him a chance. Then he looked at the sheikh. To leave a crippled man to perish with thirst was to a man of Jack's race and faith impossible.

'I shall stop,' he said, 'and take my chance. I will not leave you.'

The sheikh looked at him long and with doubting eyes; but Jack had dismissed the question, and busied himself with examining the sheikh's injuries. The dislocated ankle had been tightly bandaged, but it was plain some of the injured man's ribs had been broken, and Jack wound a bandage tightly round his body. He knew how quickly the Bedouin recovered from what seemed almost fatal injuries.

The sheikh would, no doubt, recover from his wounds, but it would only be to die from thirst.

In the morning Jack mixed a little barley-meal and water for the sheikh, but did little more than wet his own lips. Help might come, and the scanty store of water must be made to last as long as possible. The sheikh watched suspiciously as Jack poured out the precious fluid from the water-bag. He noted the scanty portion the white man took for himself, and understood with the quickness of a son of the desert his slave's purpose. From that moment he seemed to dismiss his suspicions.

Meanwhile Jack walked back to the salt well and looked at the cool water as it lay in the shade of the rock. It was death hidden under the mask of life. Was there no art by which he could rob the water of its deadly saltness? The sheikh, wise in the lore of the desert, was helpless; but a civilised brain ought to be able to solve the problem. Jack stood long, recalling all he had heard of the devices of shipwrecked sailors or lost travellers, as well as all that his knowledge of science could teach him.

At last he turned back to the sheikh. Something in his bearing spoke of hope, and the Arab looked at him with questioning eyes.

'Yes,' said Jack, 'I think I can make that bitter water sweet.'

He took the sheikh's long gun, broke it loose from its wooden stock, and examined it. It was an iron tube nearly four feet six inches long. He then took from the sheikh's saddle a small iron kettle. It was a bit of plunder from the French camp, which the sheikh valued and took with him on his journeys not so much for its utility as for its strangeness and to exhibit in other camps as a trophy. Jack tore a strip of goat's skin from the saddle, and soaked it in the salt well to make it flexible. He placed one end of the gun-barrel against the spout of the kettle, and wound the goat's skin round the junction of the two again and again, lashing it tightly. It formed a flexible joint betwixt the kettle and the gun-barrel. He filled the kettle with salt water, 'jammed' on the lid tightly with damp cloth, and placed it on the fire, with the gun-barrel resting on stones and stretched out like an enormous spout with a slight downward inclination.

Presently the kettle boiled, and the steam found its way down the long barrel. Jack had wound strips of blanket round the barrel, and he kept them cool with water. As he expected, the steam passing through the long, cool barrel condensed, and presently a bead of water formed at the end of the barrel. It dropped into the bowl that Jack had placed there. Other drops followed; they grew at last into a tiny thread of water. It tasted of gunpowder, it was warm and insipid, but at least it was drinkable. And as long as he could find fuel Jack knew in this way he could keep up the supply of water.

The sheikh had watched the whole process with uncomprehending eyes; but when, towards midnight, Jack brought him the little bowl half-full of the tricklings from the gun-barrel he understood, and his look repaid Jack.

Ten days afterwards Jack and the sheikh crept into El Kabla. The sheikh had sufficiently recovered to be able to ride, and Jack brought both the crippled man and camel safely back. Their long absence had excited wonder, but no one thought of going in search of the missing party. The sheikh told at the camp-fire the story, and many guttural expletives were expended on the missing Hamed. No particular gratitude was shown to the white slave by the camp at large; the sheikh himself spoke no word of thanks. The Bedouins are not a voluble race; but from that time he silently protected his English captive from humiliations and injuries which might well have proved intolerable.

(To be continued.)

THE OLD MANSIONS OF PARIS.

By P. H. DITCHFIELD, M.A., F.S.A.

PART I.

PARIS has many aspects. It is the gay city of pleasure and of the crowded boulevard, the haunt of the tourist, the abode of the artist, with its Quartier Latin and its Montmartre, the apotheosis of the triumphs of the First Napoleon, the scene of the architectural experiments of Baron Haussmann. Old picturesque streets, mansions famous in history, have been swept away in order to provide space for the monotonous creations of modern builders, and the long lines of houses, boulevards, and faubourgs where each building exactly resembles its fellow.

In this busy, pleasure-seeking modern Paris I love to escape from the riot of the cafés, from the endless stream of vacant-faced pedestrians who throng the boulevards, from picture-gallery and museum, in order to ferret out the bits of old Paris which have hitherto escaped the attacks of the destroyer, to build again in imagination the old inns and palaces, to wander with Dumas or Stanley Weyman along the ancient streets with their swashbuckling heroes, and to conjure up the scenes of Parisian ancient life.

If you know where to look you can find part of the walls of the old Bastille, that terrible prison

which seemed to have engraved over its portal, 'Abandon hope, all ye who enter here.' You should go along the Boulevard Henry IV. and seek the Rue Lesdiguières. Passing along until you come to the second or third house, you will find a small court, and opposite you will see a thick wall built of large layers of great hewn stones, against which leans a shed. This wall is all that remains of the ancient wall which surrounded the fortress. It was situated at a nearly equal distance from the entrance gate from the Rue St Antoine and the Little Arsenal. It was formerly much higher, and in recent times part of it has been destroyed. The Rue Lesdiguières at the time of the taking of the Bastille was only a long passage, the outlets of which were closed by a double grill, and was made on the site of the ancient Hôtel Lesdiguières, inhabited by Peter the Great. This wall is only an example of what the curious may find in old Paris if they know where to look.

Many objects that delight the antiquary are too well known to be recorded here. Most of the churches belong to the Renaissance period, and furnish examples of the style that flourished in the sixteenth and seventeenth centuries. There is, however, the ancient Church of St Germain des Près, the oldest in Paris, commenced in 1001 A.D., and dedicated by Pope Alexander III. in 1163. It was the minster-church of the Abbey of St Germain, a rich and powerful monastery, which always had a cardinal or a prince or king for its abbot. The church has been so much restored and decorated that it is difficult to discover its most ancient portions, but fragments may be found here and there. Some of the columns of the triforium of the choir belong to the sixth century, and their bases and capitals to the twelfth. During the Revolution the church became a saltpetre manufactory; and when it was converted again to its sacred uses much restoration was required. The old palace of the abbot may be seen in the Rue de l'Abbaye, built by Cardinal de Bourbon in 1586. It is built of brick and stone, and much decorated. An escutcheon bearing the arms of the founder, surmounted by a female figure, appears above a pavilion. The house is now the abode of artisans, and has lost its ancient grandeur. The prison of the abbey, rebuilt in the seventeenth century, was celebrated for the sad scenes of revolutionary violence and horror in 1792, and disappeared half a century ago.

Every visitor to Paris knows that gem of ecclesiastical architecture, the Sainte Chapelle; and, of course, Notre Dame, much modernised and restored; and St Germain l'Auxerrois, whose bell was the signal for the Massacre of St Bartholomew. It is interesting to picture again the scenes that were enacted in the celebrated *places* of old Paris: the tragedies that occurred in the Place de l'Hôtel de Ville, the old Place de Grève, which saw the hanging of the Huguenot chiefs Briquemont and Cavagnes by the order of the unscrupulous Catharine de' Médici, and the torture and execution of Comte Montgomery, captain of the Scottish Guard, who accidentally caused the death of her husband Henry II. at a tournament. A procession of victims of a despotic Government as well as of criminals seems to pass us as we stand in this *place*. We see Foulon, the unscrupulous Controller of Finance, and his son-in-law Bertier, compelled to eat hay, which he suggested as suitable food for the starving populace, and here hanged on lamp-posts; and there stood the guillotine which claimed its daily crop of victims until it was removed to the Place de la Concorde. Who can imagine that in that peaceful spot, where the fountains play and the Luxor obelisk rises, nigh the *cafés-chantants* and summer theatres, were enacted so many historical tragedies: the guillotining of Louis XVI. and his sister; of Marie Antoinette, Charlotte Corday, Louis Philippe Egalité; and in their turn Danton, Robespierre, and, by poetical justice, the inventor himself of the hateful machine that decapitated wretches wholesale? Well said Chateaubriand, when it was proposed to erect a fountain on the spot where Louis XVI. died, that all the water in the world would not suffice to remove the blood-stains which sullied the place.

But our main concern centres round the old palaces and mansions of Paris, houses once great and important, that echoed with the sound of gay revelry, and were inhabited by men and women who made history, but are now forgotten. They are the abodes of the *bourgeoisie*, the homes of manufacture and industry, and no one seems to know or can relate the tidings of their former greatness. In one of these old houses, once the residence of a distinguished cardinal in the eighteenth century, we observed to the *concierge*, 'Did not Cardinal Perraud live here?' '*Mais, oui, monsieur, il est mort.*'

In the old centre of Paris, the Isle of St Louis formerly the Isle of Notre Dame, because it—belonged to the Cathedral Chapter—we must look for some of these old mansions. The other isle, now joined to it by a bridge, was anciently the Isle of Cows, because of the good pasturage which it afforded. It has been the scene of many stately religious and civil ceremonies. Here in 1313 Philip le Bel gave brilliant fêtes when his son the King of Navarre attained to the grade of knighthood. Here came Edward II. with his father-in-law and his brother-in-law when the three kings and many lords of the Court took the cross at the hands of the papal legate, although they had no desire or intention of inaugurating a new crusade. It was the scene of many religious plays which delighted our forefathers, and here were acted the dramas of *Adam and Eve*, the *Massacre of the Innocents*, *Caiaphas and his Court*, and the *Judgment of Pilate*. When Philip quarrelled with Pope Boniface VIII., the farce of *Master Renard* was performed. The Church of St Louis is not very remarkable or graceful. The vandalism of 1793 and 1794

threatened it with destruction and to convert it into an emporium of fish and vegetables. Two of the statues were changed into the goddesses of Reason and Liberty.

Foremost amongst the old houses is the Hôtel Lambert, which occupies the extreme end of the Isle. It was built by President Lambert de Toringy from the designs of Louis Levau, the first architect of the Grand Monarque in the seventeenth century. Lebrun and Lesueur decorated it with consummate skill; François Pèrier succeeded them in the task of beautifying the house. The Flemish sculptor Van Obstal modelled in stucco some of the ornamentation under the direction of Lepautre. A great gate leads to the court of honour, which is surrounded by battlements of the Doric order. Opposite, a flight of steps leads to a grand landing. The gallery on the first floor on this side of the river was painted by Lebrun, who adorned it with mythological subjects, especially the Labours of Hercules. Lesueur covered the walls of the Salle des Bains with many pictures of sea-goddesses, nereids, Diana in her Bath, and similar representations. The house has suffered many vicissitudes and had many owners, and amongst these were Dupin, the Marquis du Châtelet, the Comte de Montalivet, and the Duchess of Orleans, mother of Louis Philippe. Here Voltaire lived for a time with Madame du Châtelet at the time when he conceived the plan of *La Henriade*. The great Napoleon came to a conference here with M. de Montalivet in 1815, when his cause was lost. This beautiful house has lost much of its ancient magnificence, and many of its pictures by Lesueur were sold to the Government for preservation in the Louvre Museum. Amongst these were twelve compositions which adorned the Salon d'Amour and the Cabinet des Muses. At one time it was a mere storehouse for military beds, and what I take to be part of the old mansion is still used as cottages for artisans. It is now the property of the Czartoriski family, and has been restored with much taste and skill. Lincelle was the architect of the restoration, who has preserved well the purity of the style of the ornamentation. The paintings have been restored by Eugène Delacroix. The gallery painted by Lebrun exists still in all its original beauty, and we still are able to admire the carved medallions of Van Obstal and the wonderful ceilings painted by Lebrun, and his Marriage of Hercules and Hebe. Some of the paintings of Lesueur are left in the staircase, in an oval antechamber on the first floor, and in the Salon des Bains in the attics. The Hôtel Lambert is more fortunate than many of the other old houses of Paris in having been so carefully preserved and restored.

Near at hand is the Hôtel de Lausun, which, alas! is in course of demolition, and a surly guardian refused us admission. Possibly he was considering our safety, as there was much scaffolding about, and the walls looked not secure, and stones and bricks might have fallen on our heads. The house bears the inscription, 'Hôtel de Lausun, 1657.' In another part of the building is inscribed 'Hôtel de Pinodau,' which demonstrates that the house once belonged to the family of the Marquis de la Vallée de Pinodau and Ogier of Lorraine. Roger de Beauvoir resided here in the time of Louis XIII., and inaugurated the lax manners that showed themselves in the Court of Louis XIV. by receiving here the secret espousals of Mademoiselle, the little daughter of Henry IV. It was, however, Antonin Nompar de Caumont Lausun or Lauzun, Marquis and Duke of Puyguilhem, Marshal of France, who conferred the greatest distinction on this old mansion. He was only twenty-five years old when he entered into possession of the property. He was a man full of spirit, gay, prosperous, and happy. He was a lover of literature at a time when genius, wit, and learning abounded in France; when Corneille and Racine, Molière and Régnard, Boileau and La Fontaine, La Rochefoucauld and La Bruyère, Descartes and Pascal, formed a galaxy of talent of which few countries, few ages, can boast. We can imagine the wits of the day, the great writers, tragedians, comedians, assembling in this house around the hospitable board of the young Lausun. The young man had his opinions, and after twelve happy years found himself in the Bastille. He was, however, soon released, and returned to this house. Honours were bestowed upon him. He was created Marshal of France, and in 1671 commanded the royal forces in Flanders. But he had enemies at the Court of the Grand Monarque. He had privately married Mademoiselle, Duchess of Montpensier, and thus incurred the wrath and jealousy of Madame Montespan and Count Louvois, the great financier of Louis. Poor Lausun was disgraced and imprisoned, and after five years was exiled. England, the home of many French exiles, welcomed him, and when the Stuarts' course was run and the throne of James II. tottering, Lausun conducted his poor queen to France. When Mademoiselle died he married Mademoiselle Durfort, the daughter of Marshal de Lorges. He lived to a great age. We see him conducting the auxiliaries to Ireland in 1689, and three years later he was made a duke. He died at the convent of Petits Augustines, aged ninety years, in 1723. In the time of Louis Philippe the house was let in apartments, and here lived Théophile Gautier. Before this chapter reaches my readers it will have entirely disappeared.

On the Quai d'Orléans is the Hôtel Dubosc, which bears the date 1789. No. 5 is the old mansion once owned by Cardinal Perraud, Bishop of Autun, which is now a museum, but unfortunately it was closed when I visited it. No. 20, on the Quai Béthune, is the old Hôtel Mazarin, which is but a relic of its former greatness. There is a fine entrance gateway, and a bronze fountain in the courtyard. We ascended a stone staircase, which replaced one of great magnificence, and discovered on the highest story some mural paintings by

Lebrun. The chambers once occupied by the Cardinal, the great statesman of Louis XIII. and Louis XIV. who took a leading part in the affairs of France, and was practically the ruler of the kingdom until his death in 1661, are let to divers owners. You can see his crafty and cunning face, as he entered this gateway, devising taxes whereby he might enrich himself and his kingdom, stamping with rage at the opposition of the Parliament or at the schemes of the *frondeurs*, hurrying away in a hasty flight from France to seek safety abroad, returning in triumph, and every day amassing wealth, which he bequeathed to his nieces, who doubtless lived here and in other mansions of the Cardinal as princesses. The home was doubtless filled with monkeys, the Cardinal's favourite pets. They were carefully tended and highly scented by his nieces, those celebrated ladies whom satirists distinguished by the name of Mazarinettes. Thus does the witty author of *Le Passeport et l'Adieu de Mazarin* write of them :

> Ainsi donc par vos limonades,
> Par vos excellentes pommades,
> Par la bonne odeur de voz gants,
> . . . . .
> Par les singes que tant aimez,
> Qui, comme vous, sont parfumes
> Par les belles Mazarinettes, &c.

The Hôtel Mazarin could tell strange stories.

No 24 on this *quai* is the Hôtel d'Ambrun. Turning to the left, we see the Rue Bretonvilliers, with an arch leading to the Rue St Louis, and a part of the old mansion of Le Ragois de Bretonvilliers, President of the Chamber of Accounts, erected soon after the Hôtel Lambert. Very little of this house remains, as a great part of it was destroyed during the Revolution of 1789. The mansion contained a beautiful gallery painted by Bourdon, and also four large paintings by Poussin and pictures by Mignard after Raphael. The chambers were very magnificent and curious. But all their beauties have disappeared, and modern houses of an inferior character have been erected in the garden of this ancient mansion. It was once the residence of the Duc de Tallard, Marshal of France (1652–1728), who fought many battles for France, and was wounded and taken prisoner by the Duke of Marlborough at the battle of Blenheim.

Opposite the Hôtel Lambert (No. 3 Rue St Louis) is a house of Fénelon, the celebrated Archbishop of Cambray (1651–1715). He was the tutor of the Dukes of Burgundy, Anjou, and Berri, and possibly here wrote his celebrated *Aventures de Télémaque*, which caused him so much trouble and led to his disgrace. We need not recall the controversy which arose about that famous book, his defence of Madame Guyon, Bossuet's denunciation of the good Archbishop as a heretic, and other scenes in his life. Many sleepless nights must Fénelon have spent in this old house while he reflected on the malice of his enemies and his own dangers and vicissitudes.

No. 45 Rue St Louis is the Hôtel Chenizot, which was built at the beginning of the eighteenth century by the proprietor, who gave his name to it. In 1840 the city of Paris converted it into a palace for the Archbishop of Paris. Amongst other distinguished occupants of the see who lived here were Archbishop Affre, who was shot by the revolutionists of 1848 in the Rue du Faubourg St Antoine when he was trying to persuade the populace to peace; Archbishop Sibour, who was assassinated in 1857 by an ex-priest in the Church of St Étienne du Mont; and the venerable Archbishop Darboy, who was shot by the Communists in 1871. You can see their blood-stained garments in the cathedral. The Archbishop's palace is now in the Rue de Grenelle.

Amongst other noted houses in this quarter is the Hôtel Marigny, the abode of Poisson de Marigny, brother of the infamous Madame de Pompadour, the mistress of Louis XV. He was a great patron of art, a friend of Voltaire, Diderot, and D'Alembert, and doubtless profited greatly from the influences of his sister in the Court of Louis. No. 39 has in the cellar a date engraved, 1680; No. 35 was built for the coachmaker of Louis XIV.; and Nos. 27, 29, and 31 were part of the patrimony of M. Lelong de Drenen, an *emigré* at the time of the first Revolution, and were, therefore, sold as the property of the nation.

These are only some of the ancient mansions which may be discovered in this portion of Paris. In another article I propose to direct your steps to some others in other parts of Paris which are equally interesting and possess even greater historic interest.

HOUSE DECORATION AND HEALTH.

By JAMES H. GALLOWAY.

IT has been said that a house well decorated is half-furnished. One may add another sentence, and say it is also essentially healthy. Even in these advanced days this latter fact needs to be reiterated; for, although scientific and medical men recognise that the decoration of the home is an important hygienic element, the majority of people do not. Too often it has been considered as a thing that could profitably be dispensed with, probably owing to the fact that this important property is not at once apparent to those who have not given the subject due consideration. An aged manager in a large firm of decorators used to persist in calling his trade a luxury; but there is every reason to believe that he

said so only to his men to impress them that the customer would not have the work done unless it were done quickly and cheaply—a pretext to make them hurry over their work. His case may, to a certain extent, be pardoned as well as that of the majority; but those who seriously persist in calling decoration a luxury cannot justify theirs. The devotees of the 'simple life' may think differently, because they do not know clearly what the truly simple life may embrace. At any rate, if art is a necessity, as Walter Crane observed a short time ago, then surely the minor art of house decoration is doubly so.

Plaster, wood, stone, and metal are covered with paint or other material primarily to protect the surface; hence the idea is in vogue that where such surfaces are not exposed to the action of the weather it is not essential to coat or cover them with anything. Such an argument might have some cogency if protection were the sole use for paints and allied materials. Indeed, in some old churches one may see seats standing at the present day quite guiltless of paint or varnish, yet in excellent condition; but such cases are exceptional, and not at all to our present point. The case stands for house decoration nowadays not so much because of its protective qualities as because of its artistic and hygienic value.

To the uninitiated there appears little relation between house decoration and personal health. In fact, it is frequently asserted that men were healthier long ago, though living in small-roomed, badly lit houses, devoid of paper, paint, or other decorative material save whitewash, than they are now, with all the improvement and extension in decorative art and building construction. Such statements, needless to say, are not based on statistics or sound reasoning. Quite otherwise is found to have been the case, and if we look closely for a moment at some points concerning the subject of decoration we shall find that they to no small extent assist in the maintenance of individual and social health.

For a simple instance take the case of a newly built house. During the first year, at any rate, the walls will be hung with an inexpensive paper, distempered, or left bare. Now, there can be no question as to whether the decorative methods or the other is the better. When newly plastered walls have been papered with cartridge they dry, but dry so gradually that the minimum quantity of dampness is in the air of the house at one time; hence there is much less risk of danger to health than when walls are allowed to dry uncovered, for in the latter case the maximum amount of moisture is always present. Distemper, at least of the patent washable quality, acts in a somewhat similar manner, though paper generally is to be preferred, as it does not usually allow the lime-salts to escape so readily as the distemper does. A German professor was wont to say that a new house should be given to one's greatest enemy for the first year, to one's most unappreciated friend the next, and to one's self ever after; but by utilising a comparatively simple decorative medium it is quite possible to escape danger all through.

Consider our hospitals, too. What would be the result if their walls were left unpainted or untreated in some decorative way? For one thing, the aspect of such a ward would soon be unbearable and irritative to patients, thereby becoming to some extent detrimental to their recovery. For another thing, such walls could not be cleaned so easily, and would be much colder and more liable to attract dampness than if painted.

But after these points are conceded, prejudice may still linger as to the nature of the materials used by the decorator. Many nonsensical ideas still prevail in regard to this subject, and such ideas, doubtless, have much to do with the belief that house decoration can have little or nothing of hygienic value to offer. One has only to recall how, some years ago, an eminent medical man wrote concerning the dangers of arsenic in wall-papers—the headaches and other ailments due to its presence—to be convinced of one indictment frequently applied by people against that form of decoration. It is not unusual to hear of ladies who will not choose green papers they like because they believe they are sure to contain arsenic. Now, as a matter of fact, there should be very little doubt concerning that. Arsenic is seldom, if ever, employed in the manufacture of wall-papers at the present day, and, at any rate, it is a mistaken notion to suppose that green is the only colour capable of containing it. Mauves, blues, and other tints were not devoid of it in the past. Its use, however, has practically ceased in the wall-paper trade, because equally brilliant tints can now be had from coal-tar—which fact, moreover, renders such colours considerably cheaper.

It may be observed, though, that there is one danger which ordinary wall-paper possesses, at least, negatively. It is not germ-proof, and, especially after a case of infectious disease, there is a risk of bacilli harbouring themselves within its porous texture. This fact has been demonstrated more than once by experiment and by painters having taken such diseases when employed in stripping wall-paper. So thoroughly is the danger becoming recognised that in some places local laws have been passed to the effect that all paper must be taken off any apartment where infectious illness has occurred, whether the room is to be redecorated or not. This is obviously an essential, and for hygienic reasons is worth a great deal more than the little extra expense involved. Of course, where no such illness has taken place and the house is kept in proper condition, ordinary wall-papers are not at all a menace to a healthy existence.

But, thanks to the evolution in decorative materials, there can now be had wall-coverings which are perfectly germ-proof, and consequently do not require stripping even after an infectious case. Their impervious surface can be thoroughly washed with soap and water without the least

detriment to their texture or colour. The ordinary sanitary wall-paper is the pioneer, so to speak, of these, and even the best quality of it is not to be despised as a hygienic agent. It can at least be cleaned much better than the common sort of wall-paper; though, of course, it would not be fair to compare it with the newer style. The maid who attempts to wash the so-called sanitary washable paper will hardly attempt it a second time. With the later papers all this has been changed. Practically the only serious drawback they have is the price. Embossed papers, such as lincrusta, anaglypta, and cordelova, are of the thoroughly washable type when painted or decorated in some way, but there is doubt in regard to their hygienic importance, owing to some of their raised surfaces forming so many small ledges for dust, which subsequently is difficult to remove even with soap and water. For ceilings they are very adaptable and artistic, but need not be referred to particularly here, as the newer style of wall-covering is much superior. Types of these latter are tekko, salubra, and pegamoid paper. They can be obtained in silky, lustrous, and matt surfaces suitable in design and colour for any apartment, from the kitchen to the drawing-room. Recently another wall-covering has been invented with all the advantages of silk and none of its attendant disadvantages. This is the newest material of all, which imitates silk so exactly in texture and lustre that the difference cannot easily be detected. There are other imitations of silk fabric in the market for hanging on walls; but, so far, the colours have been more or less liable to fade somewhat quickly, usually tending to become duller and grayer. The latest imitation, however, is said to be in colours perfectly fast to light, as well as being perfectly washable and germ-proof. It is, moreover, one-half cheaper than any others; and, considering its distinct hygienic and artistic advantages, it is certainly worth consideration.

Of course there are also many coloured canvas wall-coverings in the market, the majority of which are antiseptic and washable. They are very suitable, for artistic as well as health reasons, in such apartments as libraries and billiard, breakfast, and smoking rooms; and, when in a suitable colour, as a background for pictures they cannot be surpassed. They are liable, like most plain papers, to show a little at the edges when hung; but, this being understood, they have practically no other drawback. Fabrikona, ras-cota, and decotex are the principal of these; and where a slightly rough but healthy surface is required on walls nothing better could be selected. There is always a feeling of cosiness derived from them, too, that cannot be obtained from any other wall-covering. Apart from these qualities, it is interesting to note that, during the earthquake at San Francisco, where one of these canvas coverings had been used the walls remained quite intact, though all other walls were more or less badly cracked. From this it follows that on walls liable to cracking, such materials may be used with advantage.

These in no wise exhaust the stock of hygienic coverings. There are several metal tile decorations in the market which have come to the front in recent years, and are effective hygienic materials. We refer to such coverings as emdeca and metloid, which are eminently adapted for bathrooms, kitchens, pantries, and larders. They are formed of thin metallic sheets with glazed outer surface, hard and impervious, thus resembling porcelain tiles, though much more beautiful in design and colour. They are only one-half the price of tiles, yet admirably fulfil all the purposes of the latter. To look at them suggests cleanliness and healthiness, and the maid who cannot find time to keep such wall-coverings in perfect condition is worse than lazy. If anything, they are time and labour savers, and for apartments where frequent cleaning is required to keep them in a sanitary state, no better wall decoration could be obtained.

But wall-coverings are by no means the only materials in which progress has been made towards a greater healthiness. The sanitary distempers so much in use at the present day are other examples. These can hardly claim to have the impervious surface and, consequently, hygienic properties of the latest wall-coverings; but, considering the difference in price, they are almost as good. If a room be done well with duresco, Hall's distemper, or zingessol, it will bear sponging; whereas the ordinary size-colour will not, and, as a consequence, cannot be so hygienic. Further, this latter material has the invariable tendency to rub off on the clothes sooner or later, while the others usually become harder and more washable. Besides this, ordinary distemper gives shelter to bacilli, and the size used to bind it is usually liable to putrefaction—two things avoided by sanitary distempers. To make these latter fulfil their proper function as health-agents, it is, of course, necessary that they be cleaned frequently, for if they be allowed to become too dirty there is then a great risk of abrading their surface during the process of cleaning.

When all is said, however, paint still remains one of the best, safest, and most hygienic agents that can be used in the house. Wood and walls well done with paint are perfectly sanitary, and may be kept so by repeated washing. Despite what many people say, there can be no valid objection urged against paint. Its smell has been objected to as the cause of nausea and headache, and one cannot deny that it sometimes is so; but it would probably be safe to say not in more than one person out of every hundred exposed. Moreover, such cases are not worth serious consideration, as they occur only while paint is drying and immediately after, and by proper precaution might be reduced to a minimum. In fact, it has been found by many and varied experimental tests that certain disease-germs actually succumb to paint. For example, one French scientist

found that by placing typhoid and diphtheria bacilli on painted surfaces they became quite inert after a week or two; therefore it will be seen that the benefits accruing from the use of paint in the home far outbalance its demerits. Of course, up till recently the majority of paints used have been of a poisonous nature, and this may account for the fact that some people have a horror of paint, especially while in its drying stages. Such people may be assured that when harm does accrue from the use of paint it is usually the user of it who suffers, not the inmates of the particular house. White-lead, the usual basis of paint, is undoubtedly a poison; but people who object to its use in their homes may have their paint made from quite a non-poisonous basis. Oxide of zinc, for instance, supplies such a basis for the making of paints that are not at all inferior to those made from white-lead. In comparison with the latter, it is much more durable, whiter, and will stand sea-air and sulphur fumes. There are many other harmless pigments from which paints may be made, yet none can claim the merits of zinc oxide, so it may be recommended with safety, even though there be no objection against white-lead. In France it is the principal basis of paints, and there is no reason why it should not be so here. The recent decorations carried out at the British Museum are in themselves proof of this, all the paint-work being done with paints from such a basis. With its use, too, there would be less objection to the unpleasant smell of paint, because in thinning zinc oxide for application very little turpentine—the cause of the usual smell—is required.

But as a hygienic paint-material there is nothing to beat the white enamels now so much in vogue. The craze for enamel is, consciously or unconsciously, an important aid towards a healthy environment. The best quality of decorator's enamels are made of a non-poisonous pigment in thorough combination with a special varnish, and so long as it is in good condition it is absolutely germ-proof and easily cleaned. One has only to consider its smooth, glossy, and impervious surface to be convinced of this. Varnished woodwork or walls are in this respect somewhat similar; but as a hygienic agent white enamel has the advantage of showing at once any dust or dirt marks, and consequently is usually kept cleaner.

To retain all the hygienic advantages of gloss enamel, and yet suit tastes that do not care for lustrous surfaces, flat or matt enamels have recently been invented. These dry like flat paint—that is, without lustre—and, like the other enamels, are manufactured from a non-poisonous basis. One superiority they have over flat paints is that they will bear much more scrubbing.

Reference may also be made here to another decorative material that tends to make damp houses dry and consequently healthier. This is duripan waterproof stone-finish. It goes without saying that modern brick houses are often damp inside owing to the action of rain externally. Duripan comes in here, and is an excellent remedy. One coat on the brick surface is enough to make it quite waterproof, and the appearance of the building may be greatly enhanced thereby, as the material can be obtained in various colours and with a coarse or fine texture. It is also very adaptable for inside work, such as cellar or underground walls where dampness is liable to rise from the foundation.

But enough has been said regarding the hygienic value of particular materials. At the present day the main reason why people decorate their homes seems to be an artistic one. Go where one will, one is sure to find some attempt at house decoration; and though the paper be of the crudest and cheapest description, such facts nevertheless denote that some sort of artistic craving is at work. This is a good thing, because a love for decorative beauty is one road to greater healthiness. It is not infrequently remarked that a certain room is not worth cleaning, meaning thereby that the paper and paint in that particular room are too shabby to improve by housewifely means. Such remarks imply that the mistress of a house takes a greater interest in keeping her house clean, and in consequence healthy, when it is in good condition so far as regards its decoration. A minister once said that he had the impression that loud wall-papers in a study meant loud sermons. Whether this be so or not, the underlying principle is true. Surroundings have a psychological effect, and if the effect is good it indirectly leads to greater healthiness.

Keats said, 'Beauty is truth, truth beauty,' and so far he was correct. It might be added, however, that beauty is also health—health of mind and body. This is what beauty of whatsoever kind invariably tends to, and it is especially so in the province of house decoration.

THE DESERTED MILL.

The old mill-wheel is silent,
The water runneth slow,
The trees are green again as in
Those loved days long ago.
But there no maiden sits and spins
The gossamer which hope begins.

The birds are flying onward,
The clouds are light and gray,
The waterfowl are silent
When floating all the day.
The lilies bloom alone, and die
Unblest, unseen by any eye.

And so life ever changeth,
Each year a passing day.
The morning gold, the evening red,
Both quickly dream away.
And yet what is, is ever best,
For after work comes welcome rest.

WALTER SMITH.

SIXTH SERIES.

A BORDER BURN.

IT rises high upon Cheviot Fell, nearly three thousand feet above the level of the sea. On all sides are great hills shaggy with heather and dark with peat-mosses. Looking southwards, we see a desolate country of moor and mountain stretching far away into the heart of Northumberland. On the other hand lie the hills of Glendale, and beyond them winds the broad, fertile valley of the Tweed. To the east, across Milfield Plain, the eye is caught by the steel-blue glitter of the distant sea. On the very verge of the hollow lands the conical shape of Roscastle pushes wedge-like into the cloudless sky, its huge flanks dipped in deep woods, its crest crowned with the crumbling remains of an ancient British camp. At its foot stand the old gray towers of Chillingham, in whose secluded demesne still wander at will the sole survivors of those immense herds of wild cattle which once roamed in primitive freedom through the trackless forests and lonely mountain solitudes of Northumbria.

Westwards the fells overlap one another like the waves of an angry ocean. As we gaze north again, the Eildon Hills—'three crests against a saffron sky'—show approximately the position of Melrose (the Celtic *maol-ros*, or bare moor), with its Abbey, most romantically situated of ruins, and Scott's stately home of Abbotsford, picturesque despite its false Gothic of Ruskin's abomination; then the bold sweep of the Lammermoors and the peaked cap of Duns Law bar a wider range of vision into 'Caledonia stern and wild.'

The burn, at first a slender thread of sparkling water, runs singing down a narrow pass; shut in on every side by frowning, precipitous crags, it still makes a merry, lilting music as it goes. A savage, dreary spot! Even in summer-time the sun's rays never penetrate here. Through the long winter months 'tis the home of brooding mists. For roof it has but the thinnest strip of sky. Deep drifts of frozen snow linger, loath to depart when spring blooms are starring the valley-pastures below in Milfield Plain; they melt at last, and then the burn, swollen to a thundering torrent, rushes headlong down the gorge, leaping over mighty fragments of rock, bearing with it the trunk of an uprooted pine as easily as if it were a broken twig; waking the sullen echoes of the place with hoarse outcries, until one can almost fancy the scream of the kelpie, the malignant water-sprite, that, rumour has it, haunts the ford at the foot of the ravine when the storm-fiend is abroad and 'nights are long and mirk.' The croaking raven still nests here, high up in the shelter of inaccessible crags; driven from wood and policy by the animus of the gamekeeper, shot at sight by that worst of vandals the Cockney sportsman, this is one of his last places of refuge, and he clings to it, even as in old days the natives of the country-side fled to these same mountain fastnesses when the fierce Northmen came sailing overseas to ravage the fertile valleys, and depart leaving behind them, in place of cultivated fields and prosperous homesteads, blackened ruins and desolate, waste places. Here, too, the gray badger has his earth among the rocks, and lives free from all fear of persecution.

Once clear of the pass, the burn winds ever downwards on its way to the plain. Sometimes, as if weary of singing, its voice dies to the merest whisper, soft as the sigh of the wind in the reeds or the sough of the night-breeze as it sweeps through the fronds of the mountain fern.

Are the lonely hills green with the freshness of the spring of the year? Are they garbed in purple—the imperial robe of summer? Or are they afire with the dull red of the fading bracken, and hung with the pale gold of autumn woods? With each season, whether it be 'the time of tender, opening things' and the dawning of a hope as wide as the world, or the sombre sadness of the year's decline, when the message is one rather of a quiet resignation, the song of the stream is ever in perfect accord with Nature's changing moods. Life flourishes wherever it flows. Great speckled trout lurk in dark pools beneath its overhanging banks. The gray heron stands sentinel for long hours, his only movement an occasional downward

 [*All Rights Reserved.*]

plunge of his bayonet-like beak when an unwary fish ventures too near the smooth-worn boulder upon which he mounts his guard; and all day long the plaintive curlew cries above the wide stretches of swinging heather. The heron appears to have a very leisurely flight, but when he is seriously alarmed his powerful wings will carry him out of danger at a great speed.

Where the burn opens out and ripples musically over a bed of brown pebbles the seat of the otter may frequently be noticed on the sand left dry since the waters were last in spate; but the big rivers farther north are more especially his happy hunting-grounds. He is a most extravagant feeder, ofttimes catching a salmon from sheer wantonness, it would seem, taking one bite out of its back just below the neck, and leaving the remainder lying on the river-brink to be preyed upon by water-voles or picked up perchance by a prowling fox.

Now the burn dips between the shoulders of two opposing fells, each fringed with a straggling but extensive plantation of larch and fir—a favourite resort of blackcock; I have rarely passed that way without flushing a couple of brace or more. At certain seasons the golden-plover abounds; and over the crest of the hills, on the rolling moors, the red grouse crow defiantly, particularly when the weather is about to change and big masses of cloud come surging up out of the heart of the western mountains. Semicircular shelters, fashioned of peat-sods piled breast-high, dot the moors at intervals; these are for the convenience of sportsmen, when in August the sharp crack of the double-barrel rouses the mocking echoes, and feathers fly as the driven grouse pitch headlong to earth and stain the purple heather with their crimson life-blood. For the rest of the year the shelters are patronised chiefly by sheep, for great flocks of the celebrated Cheviot breed roam for miles over these rich grazing lands, and every now and then one may come across a shepherd's shealing backed against a hill or nestling in some solitary cleuch overhung by ash and alder, with perhaps a little burn brawling below on its way to the distant lowlands.

In places where the burn has inundated its banks and left the ground marshy the jack-snipe makes his home. When startled, he rises with a peculiar cry which sounds like *sceap! sceap!* and wings away upon his zigzag flight, the despair of so many shooting-men, although, as he seldom fails to resettle at a comparatively short distance, a second shot may generally be obtained.

Just before the burn flows into the wide and cultivated plain it makes a clear leap of fifty feet, falling, a cascade of foam, over a chaos of rocks and crags into a deep, clear pool. Here in June the banks are festooned with honeysuckle; every nook and cranny is green with maidenhair fern and delicate mosses; dog-roses, tinted pink-and-white like the sea-shells we sometimes find upon the shore, grow almost to the water's edge; perchance a late primrose peers shyly from some sheltered corner, and the tall foxglove's pyramid of bells swings to and fro in the gentle breeze. Twenty feet above the pool, the steep slopes are golden with the flower of the broom—the *planta genista* of the kingly Plantagenet line; and higher still, on the summit, grows an impenetrable acre or so of whin-bushes, the chosen lair of the big hill-fox when he comes prowling after the tender young rabbits that steal out to feed as the sun dips down into the mountains, or else he crouches with wistful eyes watching the ducks and chickens questing round the mill buildings immediately below the linn. Rushing past the great water-wheel and the old white house, the burn makes a sharp curve which carries it almost to the foot of proud Homildon, the hill whereon long years ago the Percy and the Douglas met in a sanguinary fray, during the course of which the latter was taken prisoner, and his followers who held the hill were simply mown down by the cloth-yard shafts of the English archers. The name Red Rig, or Ridge, still clings to the locality, commemorative of the bloody nature of the conflict. In the valley, a thousand feet below, stands a huge gray boulder, all weather-stained and encrusted with lichen; here, tradition has it, the bones of those slain on Homildon were buried after the battle, and the stone placed in its present position to mark the dismal spot. Indeed, the whole of the Borderland is rich in memories. Hardly a hill, hardly a heugh, that has not its legend handed down to us in those stirring ballads, the outpourings of the poetical and imaginative spirit which is the especial heritage, it would seem, of a primitive and warlike people. Even the names one encounters in the district are indicative of the stormy days of internecine strife—Bloody Bush Edge, Hell Path, to take only two of them.

In Milfield Plain the burn mingles its waters with those of the river Till, which in turn joins hands with the Tweed, to flow into the sea at Berwick. How does the old rhyme go?

> Says Tweed to Till,
> 'What gars ye rin sae still?'
> Says Till to Tweed,
> 'Though I rin with speed,
> And ye rin slaw,
> For ae man that ye droon
> I droon twa.'

In point of fact, the sullen Till has an unenviable reputation for treacherous quicksands and deep, dangerous pools; consequently, at one time or another, it has levied a heavy toll upon human life.

Still following the burn, despite its juncture with the river, as it winds, silent now and sluggish, through Milfield Plain, past the little market-town of Wooler, which stands upon an outer bastion of the Cheviot range; past the spot where, tradition tells us, Earl Surrey camped the night before the fateful fight of Flodden Field; past the hamlet of Doddington, with its gray and ruined peel-tower—a

veritable place of refuge in the days when England and Scotland strove mightily for supremacy, and bearded moss-troopers rode with jingle of sword and stirrup along the narrow tracks which are yet discernible across hill and down dale; and so beneath the shadow of Yeavering Bell, perhaps the most graceful of the Cheviot Hills—its summit crowned with a broken altar reared long ages back by sun-worshippers whose temples were not made with hands—until it flows swiftly under the massive arch of Twizel Bridge. Here, upon a September day nearly four hundred years ago, Surrey crossed the Till at the head of his array, and by this flanking movement flung himself between the Scots encamped on Flodden Edge and their native land, what time the fated James was dallying with 'Heron's witty dame' at Ford Castle, now one of the seats of the Marquis of Waterford. To-day, looking upon Flodden, crested with peaceful woods, it is difficult to realise that its slopes once ran red with the blood of fifteen thousand men, victors and vanquished. Scarce a family of note in the whole of Scotland that was not impoverished of its noblest and best upon that disastrous occasion.

Our burn, now doubly lost in the waters of the Till and the Tweed, turns seaward, and flowing past 'Norham's castled steep'—a fortress which, as the headquarters of the Warden of the Eastern Marches, has in its time sustained a hundred sieges—so falls at last into the outstretched arms of the ocean.

But my most cherished recollections of this 'wan water from the Border hills' cling to the bare, mist-hung mountain-side where it has its source. Every crag, every stunted, twisted tree, is a familiar friend. Yonder little shealing that lies so snugly in the heugh, protected by a circle of sturdy pines, is a place of happy memories—alas that 'seas between us braid ha'e roar'd,' and, for that matter, still roar! Spring, summer, autumn, winter, each season has its own peculiar charm in this land of the heather-flower. And best of all good times, perhaps, is at the close of a day in late October, when the red hills flaunt the gold of the mountain-ash and the pale orange of birch and alder; when the rose-tint fades from the lofty summits of the lonely mountains and the deep-crimson stain dies from the dark night-clouds above Flodden Edge. The tired rooks are homing to the twilight woods; the plovers are wheeling restlessly before settling down to repose; an owl hoots drearily from a belt of dusky firs. Gradually the shadows thicken until the swelling outlines of the moors become merged into one indistinguishable whole, and a solemn silence, a profound peace, falls like a benediction upon the dim shapes of the everlasting hills.

A PAWN IN THE GAME.

CHAPTER XXXV.—THE ESCAPE.

JACK guessed that El Kabla must be in the heart of what is known as the great Nubian Desert, and almost as far south as the twentieth degree of latitude. Due north, under certain conditions of the atmosphere, could be seen faintly the summits of a mountain range. He picked up from the gossip of the camp every hint as to the desert geography he could, and decided that these mountains were the extremity of the range that is thrust forward like a spear from what is known as the Great Cataract, midway into the melancholy waste that stretches from the Nile to the Red Sea. He knew that the Nile lay far to the west, the Red Sea to the east.

For him, then, the way of escape ran northward, and by preference to the east of the central range. If he went to the west of it he would be travelling inward towards the Nile, and must strike a belt of populated country in which it would be almost impossible to escape detection. To the east of the range lay, it was true, a vast stretch of desert solitudes; to plunge into its empty landscapes was in the highest degree perilous; yet some instinct made him turn his face eastward. The sea lay there. There were French garrisons along the coast and British ships upon the waters. The very thought, indeed, of the restless sea, with its leaping waves and blowing winds, filled him with longing.

The tribe lived chiefly by plunder, making forays on the caravan-tracks east and west; but Jack knew he must postpone his dash for freedom until they made some bold foray to the north. Every mile in that direction was for him a mile nearer safety. But the months went by, and no band from the oasis turned the heads of their camels northward.

And meanwhile Jack's position amongst the Bedouins became more difficult. He knew that the sheikh, in his grim and taciturn fashion, was the one friend he possessed; he stood silently betwixt 'El Nazarin'—as Jack was called—and the cruelties practised on the other slaves. But he was growing feeble; his power over the fiercer spirits of the tribe grew less every day. His son Hassan was of a brutal temper, with an evil fire of fanaticism running through his brutality, and Jack felt that he hated him because he was a Christian. So for the unfortunate 'El Nazarin' the interval betwixt escape and death was swiftly narrowing.

There had been noisy debates amongst the Bedouins on some proposal for a more daring foray than usual, and at last it became clear that a

great adventure was resolved upon. Camels were carefully examined, saddles repaired, arms cleaned, stores of food and water prepared. A raid, it was at last announced, was to be made on the caravan-track leading to Wady Halfa; and with a leap in his blood Jack realised that this meant a bold ride of many days through waterless country to the north. The moment for making his dash for freedom was near.

Early one morning the party rode out. It numbered some forty, including half-a-dozen slaves; and Jack was delighted to see that Sidi was one of the party. The sheikh was too old to accompany them on an adventure which would tax the endurance of the warriors of the clan to the utmost. Hassan acted as leader. This, Jack knew, was for him an unhappy circumstance. There was a disquieting malignity in the Bedouin's eyes as they fell upon him. 'El Nazarin' need expect scant mercy if he gave any occasion for cruelty. Even if he gave none, the cruelty was sure to come; and the look on Hassan's gloomy face hardened Jack's resolve to seize the earliest moment for breaking away from the band. But still he waited with resolute patience; each day's journey northward, he believed, improved his chances.

The band pressed on with speed in spite of almost intolerable heat, for the stretch of waterless country to be crossed was wide, and the temper of even the Bedouins grew more cruel under the strain of travelling. A scanty measure of water was served out twice a day to each member of the party; but the slaves had a smaller allowance than even their masters, while Hassan seemed to delight in giving to 'El Nazarin' only enough to tantalise him and to leave thirst parching his tongue and burning like a fever in his blood.

On the seventh day the heat was intense. It seemed as if the very air would take fire. About noon a faint wind from the south began to stir. It filled the atmosphere with particles of dust which stung as though they were white-hot flakes streaming from the mouth of a furnace. The sky grew dark with a purple haze. Jack looked round for a moment on the band through the dust-filled air. The Arabs were plodding on, their *haiks* thrown over their faces. They were hardly visible in the eddies of strangling dust.

The wind rose fast. In less than an hour it was screaming above them like a hurricane. The lighter dust was blown away, and so it was possible to see some little distance; and through the eddies of dust-filled air could be seen, on an amazing scale, the most terrific phenomenon of the desert—the sirocco. The furious wind seemed to tear from the ground vast masses of sand, whirl them into cylindrical shape, and drive them gyrating at speed across the landscape. Jack counted no less than twenty of these huge pillars of sand in movement at once. Some were travelling with the speed of a galloping horse across the floor of sand, their summits torn into streaming fragments. Others moved with a majestic slowness, their tops rising almost beyond the reach of eyesight. The procession of giants came and went as though in the convolutions of some titanic dance.

At the spectacle the band had suddenly dismounted. Many flung themselves down, thrusting their very faces into the sand; others crouched with their *haiks* thrown over their heads. The camels squatted, stretching their long necks as close to the ground as possible. The slaves were left to their own devices. Jack, like the rest, had flung himself on the ground; for to stand upright was impossible. But though the wind-driven sand pricked his face as if with flying needles, he could not take his eyes from the monstrous tangle of spinning sand-pillars hung betwixt the storm-vexed heavens and earth.

Presently Jack realised that this strange dance of whirling columns was drawing to a centre, and the meeting-point threatened to be on the very spot where the band lay crouched. He saw two of the vast, reeling pillars crash together and fall, and a sudden hill of sand marked the spot where they tumbled. Every now and again a sort of cataract of sand would fall upon the party, flung from the flank of some rushing column, and the half-strangled men would fight their way out of the living grave with difficulty. If one of these great masses broke upon the party Jack knew that they would be blotted out of existence in a moment.

At last, through the haze of eddying dust, he saw one great column moving with majestic slowness, its top almost rising beyond the reach of sight, straight upon them. It seemed to tear up the surface of the ground as it came on. The vast mass of sand which composed it was in a state of wildest agitation. It was a sort of vertical whirlpool of sand-particles running up into the sky.

As Jack watched its oncoming he felt sure this was the end of everything for him. But when still a couple of hundred yards distant it curved in slow and stately fashion to the right, and then went past in a thundering roar, flinging upon them as it went a spray of sand that in a moment buried the entire party.

Jack was crouched beside his camel, and found a sort of shelter behind its hairy back. He lay passive till the rain of hissing sand above him had ceased, and then at last, and almost with the sensations of a dying man, struggled out. The dance of cloud-pillars had swept away. The wind had fallen. The air was still dark with suspended dust-particles. Jack cleared his throat of the strangling sand with difficulty, and drew a deep mouthful of air; but the fiery atmosphere seemed to scorch his very lungs. He dragged out his water-bag and drank a mouthful of the tepid fluid.

The full weight of the column had not fallen on the party, but the spray of flying dust had been piled over them till they were buried. An irregular

cluster of mounds marked the position of some of the camels; beyond them the piled sand rose to a great hillock.

Jack set to work frantically on the mound nearest to him, beneath which he knew Sidi lay. He dragged him out presently, his black face swollen in the agonies of suffocation. He poured betwixt the thick lips a little water, and the negro presently recovered, coughing violently to clear his throat of sand. For an hour the two toiled to rescue the other members of the band.

Hassan was one of the first dragged out. He was nearly dead. Sidi shook his fist exultantly over the Arab's distorted features; but Jack thrust the negro aside and poured a little water down the choked throat of his tormentor, and left him to gather strength while he laboured to rescue others. Hassan's long gun lay beside him, and before he left him Jack slipped the flint from the lock. He could not trust the Bedouin's gratitude, even though he had saved his life.

Some of the Arabs dragged from beneath the sand were dead; and, in addition, nearly one-half of the party lay buried beneath the gigantic hillock beyond all hope of rescue. The huge mass of tumbled sand was their grave. Some fifteen or sixteen camels had struggled to their feet, and were standing moaning, still in terror and distress.

Out of a band of forty only fourteen had escaped, and some of these were still insensible. Jack realised that the moment for his escape had come. It had come in a tragical fashion, it was true; but perhaps it was all the more favourable on that account. He beckoned Sidi to him.

'I shall take my chance,' he said to the negro, 'and escape.'

The negro nodded comprehendingly and energetically, and declared he would go too. Jack looked at him steadily for a moment.

'Yes,' he said, 'you shall come if you will; but it is life or death for us.'

Sidi grinned cheerfully in reply, and the two set to work at once to prepare for their flight. The rescued Arabs were too stupefied to interfere with them. Jack chose the two best of the surviving camels. One was what is known as a *heirie;* the compact frame, the symmetrical limbs, the finer hair, were all signs of breed. A *heirie* of an inferior kind, known as a *talayeh*, was chosen for Sidi. No camel in the party, Jack knew, could overtake either of those he had chosen. Some bags of dates were seized, the best of the water-bags, two long-barrelled guns with ammunition. Sidi had chosen a couple of spears and two formidable knives, and in a few minutes Jack felt he was equipped for escape.

Hassan was still leaning against a hillock of sand when Jack walked up to him.

'I am leaving you camels and food enough,' he said; 'but we part here.'

The Bedouin stared fiercely at him without reply, but while Jack was speaking his brown hand stole out and grasped his long gun. His fingers ran over the lock, but the flint was gone.

'You are helpless, Hassan,' said Jack, who had quietly watched the process. 'If "El Nazarin" were a Bedouin you would be lying *there* still;' and he pointed sternly to the piled sand.

Sidi, who stood by him, laughed derisively at the Bedouin, and stooped over him as though to strike him. He had unnumbered cruelties to repay, but Jack plucked him roughly back.

'The man is helpless. Do not strike him.'

He turned, mounted his camel, and rode off, Hassan staring after him in fierce silence. Jack wasted no regrets over the Bedouins lying strangled beneath that hill of hot sand. Perhaps he had himself caught a touch of Bedouin pitilessness. The world, he believed, would be sweeter and happier without them.

As he rode away a rush of gladness swept through his very blood. He never dreamed of an escape like this. He was mounted, armed, equipped, with a loyal comrade by his side, and he turned and looked gratefully at Sidi's huge form. He knew they need fear no pursuit. Hassan would creep back slowly to the oasis, and when he reached it he could organise no band to follow them. Whatever perils lay in front of them, there were none behind. A sense of freedom swept through him like an intoxication. He threw up his arms with a shout. Sidi laughed.

'We may die, Sidi,' he cried, 'but we shall never be slaves again.'

'I am your slave,' said Sidi.

'No; you are my comrade.'

Then followed many days of steady travelling—days crowded with perils, scorched with heat, sore with fatigue, but yet days illumined with hope. For, as they travelled, the black shadows of slavery grew ever fainter behind them. There was enough in the experience through which they passed to tax the utmost fortitude they possessed. No matter with what energy they pushed on over the arid and measureless plain, they seemed to make little progress. It was as though they were mere insects imprisoned in some great swinging circle of sun-scorched hills.

The sickle-like horizon was almost as clear as that of the sea. The sun broke over the curving rim to the east, climbed to the flaming zenith, and sank in another flame of colour over the westward rim; and under the arched fire of that terrible sky they travelled like men in a dreadful nightmare, it almost seemed, without making progress. The mountain peaks on the left hand kept their place unchanged day after day.

And yet, as they travelled, Jack felt his heart grow lighter with every stroke of his camel's legs. The sea was still far off, but something of its freshness stole into his blood. A weight seemed lifted off his imagination. He looked about him with a

new vision. He began to realise what may be called the fierce beauty of the desert—the splendours of sunrise and of sunset, the long day, with the soft, insistent pad of the camels' hoofs running through the hours like a thread of music.

The wheeling shadows marked the flight of the hours. At daybreak they stretched far to the left; at noon they swung foreshortened under their very feet; as the sun went down they crept far out to the right.

Again and again they saw the wonder of the mirage. In the still heat the landscape seemed to undulate, the stones to move and flicker. Then out of the wavering plain broke the vision of lakes reed-fringed and bird-haunted, stretches of clear water in which the clouds were mirrored; and the two fugitives rode on, staring like men bewitched on this aerial picture of cool waters painted on the hot floor of the desert.

Sometimes fierce winds rose and beat on them, and Jack realised that the sea of the desert has its waves as truly as the ocean itself. For the driving wind would pile up tiny hills of running sand, then level them again, as if in sport, till the whole plain seemed to rise and sink in restless, running crests of brown spray.

The days were sharply edged with danger. Sometimes they had to creep past a Bedouin village in the dark. Sometimes, pressed by thirst, they rode boldly into an Arab encampment. Dismounting, they would stand till the sheikh came out, and exclamations of *salaam* and *aleikoum* were interchanged—the greeting of the desert. Jack kissed the dirty *haik* of the sheikh or his equally dirty hand. He could talk the vernacular of the desert as readily as he once talked the *argot* of the Paris slums, and he would tell some tale how they belonged to a remote tribe raided and almost destroyed by some hostile clan.

Sidi's dark face usually served as a guarantee of genuineness to the pair; but the desert is full of suspicion, and again and again they narrowly escaped detection.

Once they had to maintain a running fight for a couple of days, and only the speed of their camels and Jack's good shooting saved them. But onward still they rode. The space they had to cross seemed measureless. A mountain peak to the west kept march with them for days, till it seemed as if they would never drop it. At night the Southern Cross kept its place unchanged in the purple heavens until Jack thought it would never dip towards the horizon. But still onward, with unfailing courage, the pair pressed. Freedom beckoned them, and Hope.

(To be continued.)

THE SIMPLON TUNNEL

THE longest tunnel in the world by nearly three miles, the Simplon, has a history which, apart from its merits as a mechanical triumph, is of considerable interest. It is quite fifty years since the idea of cutting it occurred; but it was not until forty years later that the work was actually taken in hand. The new passage into Italy makes the distance between Milan and Paris thirty one and a quarter miles shorter than by the St Gothard, and sixty miles less than by Mont Cenis.

Doubts were thrown by experts as to the possibility of constructing a tunnel of such great length, with seven thousand feet of mountain above it. Accordingly the Swiss Government summoned an international commission of experts: Signor Giuseppe Colombo represented Italy; Herr C. J. Wagner, constructor of the Arlberg Tunnel, represented Austria; Mr Francis Fox (of Sir Douglas Fox & Partners) represented Great Britain. Mr Fox is the only Englishman identified with the undertaking, of which he has given a most lucid narrative in his *River, Road, and Rail.* Work was begun at Brigue in Switzerland in August 1898, and the tunnel was pierced by February 24, 1905. Some three thousand men were employed in three shifts of eight hours during the twenty-four hours. The health of the men was kept up by means of attention to food, baths, and personal hygiene. The progress made for months at a time was eighteen feet of gallery during the twenty-four hours, which exceeds the rate of progress of any similar undertaking. At four thousand four hundred mètres from the Italian entrance, a large spring of cold water, sending out twelve thousand five hundred gallons per minute, was struck; the other troubles, all of which were successfully overcome, were due to hot springs of high temperature and soft rock. Mr Brandt (of Messrs Brandt, Brandan, & Co., the contractors) died in the course of the undertaking. His hydraulic perforator or drill is a rotatory and non-percussion drill, three inches in diameter, with a pressure on the cutting points of ten tons, moving at slow speed, but capable of being quickened. Armed with a steel tool with three cutters, it gnawed the antigorio gneiss through the mountain.

As illustrating the scientific accuracy of the whole calculations and plans, it is worthy of note that, although the distance between the two sets of workmen was twelve and a quarter miles and it took over six and a half years of constant boring to effect a union between them, the final partition was pierced as accurately as if both bodies of workers had each other in sight from the start! It took thirteen years to bore the Mont Cenis Tunnel, and nearly ten years to cut through the St Gothard; yet the former is only eight miles,

and the latter between nine and ten, so that the Simplon Tunnel has been constructed in nearly one-half the time, and has been more accurately engineered than either of its predecessors.

The Simplon really consists of two tunnels, each having a single track at about fifty-two feet distance, and these are connected by transverse galleries. One only of them has been arched; the other will be completed as a second tunnel when the traffic requires it. The complete tunnel is eighteen feet high by seventeen feet wide. The only miscalculation in connection with this huge undertaking would appear to be in the original estimate as to the cost. It was thought that two million seven hundred and eighty thousand pounds would cover the outlay; but it is now found that this sum is short of the actual expenditure by more than half a million sterling, the exact figures being three million one hundred and twenty thousand pounds. This seems a large sum to spend on a railway tunnel; but it is not nearly so large as the sum spent in constructing some of the new 'tube' railways in London. Roughly, the latter cost the companies something like five pounds an inch, while this great Alpine tunnel cost less than four pounds per inch.

Writing to a contemporary, one of our greatest engineers said: 'None can fail to sympathise with the workmen who, after many years of dark burrowing in the rock from both ends—each party endeavouring to get at the other—could, at last, hear one another's voices through the thin partition of margarite, chalk, gneiss, mica, and gypsum which separated them; and one can quite understand how it came to pass that when the Mont Cenis Tunnel was being cut both Swiss and Italians shouted themselves hoarse with delight when they came so close to each other that a single stroke of the pickaxe would bring them face to face after so many years of laborious effort to get at each other.'

À propos of the Mont Cenis Tunnel, it is interesting to note that during the first four years of its construction the average progress made was not more than nine inches per day; whereas, by the aid of Brandt's hydraulic drills, the great speed of twenty-two feet per day was obtained in cutting the Simplon. Of course, even with the most scientific of modern appliances, the work of boring a tunnel is necessarily slow and arduous; and when we remember that it took thirteen years to cut out the Mont Cenis and nearly ten to get through the St Gothard, it is certainly a high feather in the caps of the Simplon operators that they carried out their work at the rate of two miles each year, from start to finish.

It was at first proposed to use steam-trains in the tunnel, but afterwards the electric system was decided upon on account of the great heat coming from the hot springs, and because of the difficulty of ventilation. Electric locomotives hauled two-thirds of the passenger-trains from the commencement. For more than a year past electric traction has operated all of the traffic passing through the tunnel, although there have been a few temporary interruptions. The electrification of the line from the Italian portal at Iselle to Domo d'Ossola, eleven and a half miles in length, is now proceeding.

Mont Cenis lies between Savoy and Piedmont. The mountain is eleven thousand seven hundred and ninety-two feet high; and, under the orders of Napoleon, the great engineer Fabbroni constructed a road which cost three hundred thousand pounds. But the tunnel (which was begun on the Italian side in 1857 and on the French side in 1863) cost three million pounds. So that, notwithstanding the difference in length, the outlay was something similar to that entailed by the directors of the Simplon Tunnel; while the St Gothard Tunnel (1872–80) ran into no less a sum than nine million and eighty thousand pounds. Of this amount, we are told, 'Switzerland contributed one million one hundred and twenty thousand pounds, Italy two million two hundred thousand pounds, and Germany one million two hundred thousand pounds; while one million eight hundred and forty thousand pounds was raised by shares and two million seven hundred and twenty thousand pounds by mortgage.' As a financial investment this line has proved a great success, the shareholders' dividends being annually on the increase. The summit-level of the St Gothard Tunnel is three thousand seven hundred and eighty-eight feet above sea-level; that of the Simplon Tunnel is only two thousand three hundred and thirteen feet.

Stimulated by the cutting of the Simplon Tunnel, and afraid of loss of traffic, the French Ministry has commissioned plans for a railway between Chamonix and Aosta, which would necessitate a tunnel of eight and a half miles through Mont Blanc between Chamonix and Entrèves. There is a movement in Italy also for the boring of a tunnel through the Splugen by way of the Grisons and Milan; and Genoa, which is gaining ground as compared with Marseilles, requires new routes to the Alps to cope with expanding trade.

THE HEEL OF ACHILLES.

II.

PASSED the spring and came the summer, flower-crowned like a bride. The cherry-trees had doffed their virgin wreaths and donned the jewels of maternity so prodigally that their boughs hung low and the red treasure which freighted them gleamed thickly through the green dusk of crowded leaves; and Miss Tapscott, proud in the joy of possession, lived her life of isolation in the green open, nor asked for any companionship save that of the fruitful trees, the piping birds, and the prim little beds of lavender and geraniums and flaunting marigolds which she herself had planted. Not once in all the weeks she had inhabited her half of the divided property had she come in contact with her co-legatee, or caught even so much as a passing glimpse of her or her boy; for each held rigidly to the terms of agreement, and widow and maid might have been as widely separated as the two poles for all intercourse there was between them.

Sometimes, it is true, Miss Tapscott could catch the sound of childish laughter or the soft murmur of a woman's voice from the other side of the high board-fence which divided the two gardens; but it did not bring to her any sense of loneliness, any desire to level the barrier which separated these other lives from hers; and it was not until mid-June that anything occurred to disturb the peaceful serenity of the spinster's isolation.

A storm overnight had found a weak spot in the garden-fence, and levelled a portion of it far down by the rear boundary-wall, where the cherry-trees hid it from Miss Tapscott's eyes; making a gap about two feet wide in the thick screen of morning glories and scarlet-runners and climbing nasturtiums which Miss Jo had planted to mask the grim bareness of the unpainted boards. In time her sharp eyes would be sure to ferret it out when she made her regular morning tour of inspection; but that time was not yet, for the storm had made havoc among her flower-beds, and beaten and broken her treasured geraniums remorselessly.

But other eyes had spied it if hers had not; and Miss Tapscott, down on her knees with a door-mat under her, busy pruning and tying up her mangled plants, was suddenly startled by a voice saying close to her elbow, 'Your chewweries is all comin' off the twees by themselves; so I bwinged 'em home to you—see!' and, glancing sharply up, she beheld standing beside her a small, bareheaded figure, with a red-stained face and a looped-up pinafore half-filled with luscious windfalls.

Miss Jo rose to her feet and indignantly stabbed the air with her pruning-shears.

'Now, you march right straight out of here this instant,' exclaimed she, 'double-quick now; and tell your ma that this is ag'in' agreement.'

'Oho! what funny big scissors!' laughed the child, totally unused to being repulsed or spoken sharply to, and therefore failing to understand Miss Tapscott's ire. 'Does your mummy let you play wiv scissors? Mine don't. Here's your chewweries. I eated some.'

'Well, you kin eat the rest, then; I don't want 'em,' snapped Miss Jo ungraciously. 'Git along now, and go back where you belong. How'd you get in here I'd like to know? Did your ma hev' the cheek to let you come?'

'Mummy don't know. Mummy's lyin' down. It's one of her "bad head" days,' replied the child plaintively. 'And I didn't have nuffin' to do but jiss walk in the garden and play wiv my kitten. It was kitten what finded the hole in your fence first.'

'A hole in the fence?'

'Oho! Look! here's a big, big chewwery. "Open your mouf and shut your eyes, and I'll div you somefing to make you wise." You mustn't look. Jiss bend down and open your mouf.'

'Oh, get along with you! I never see sich a pesterin' critter. Where's that hole in the fence, hey?'

'"Open your mouf and shut your eyes, and I'll div you somefing to make you wise."'

'Oh well, then, *there*, you pesterin' little nuisance! I suppose there ain't no other way of gittin' rid of you; and if'——

A big cherry dropped into her mouth, a shower of others fell upon the grass at her feet, and at the same moment she felt two little clinging arms wrap themselves tightly about her neck, and a pair of warm, soft little lips press themselves to hers. And at the same time, 'I getted first kiss! I getted first kiss!' laughed the child, releasing her and clapping his hands joyously. 'Now, you dot to pay "forfeit" and be my horsie. Dit app!'

'Well, of all the—— Lands sakes alive! what on earth—— Let go my skirt. I never see sich a perseverin' little imp in all my born-days. The way your mother's brung you up is somethin' scandalous.'

'Dit app!' reiterated the laughing child. 'I'm doin' to dwive you to Banbury Cwoss to see the hole in the fence. Dit app! It's "forfeit," and if you don't pay "forfeit" you has to div two hundred kisses and cawwy me up to bed in your arms, you know; same as mummy.'

'Good land!' exclaimed Miss Jo in dismay, 'I never see sich a child. There ain't no shakin' you off nor gittin' rid of you nohow; you jist pester and pester until a body *has* to give

in. Where's the hole in the fence? Oh, down that way is it? Well, come on, then, and be done with it!'

And with that—well, you'd hardly believe it; indeed, she found it hard to believe it herself—Miss Jo threw down her pruning-shears and skipped forward; and had any one peeped over the garden-wall at any period during the course of the next minute and a half he would have been treated to the spectacle of a maiden-lady in a sunbonnet and blue-yarn stockings prancing goat-like down the orchard-path, with a laughing child clinging to the tail of her skirt and lustily shouting to her to 'Git app!'

From the first it had been Miss Tapscott's firm determination to put the child on the other side of the fence and to nail up the boards as soon as the breach was pointed out to her; but, oddly enough, when they came to it at last her whole attention seemed to be claimed by the large quantity of cherries which the storm had stripped from the trees, and which now lay scattered thickly on the close-cropped grass.

'It's pufficky sinful for all that fruit to go to waste,' mused she. ''Tain't hurt a bit, and it'll make beautiful cherry-pies.—Be you fond o' cherry-pie, babby?'

'Oh, I love it! And so does mummy.'

'Ye do, hey? Well, jist you run up to my back-door—I'm clean tired out with your gallivantin', and ain't got breath enough left to stir a feather—and fetch back that little wicker basket you'll see settin' on the winder-ledge, and we'll pick these cherries up and you kin take them in to your ma when you go. Hurry up now—I've got my geranium-beds to attend to quick's ever I kin git back to 'em.'

But even when the cherries were gathered up and placed in the little basket, the geranium-beds still waited attention and the gap in the fence still remained unclosed; for the untidy state of the grass under the trees where the fallen leaves and the broken twigs lay appealed to Miss Jo's love of neatness, and she and the child busied themselves in collecting them and bearing them away to the rubbish-heap. It was while they were in the midst of this operation that an anxious voice sounded, and a pale, frightened little woman appeared at the gap in the fence.

'Oh Wally boy, how you frightened me, dear!—I woke up and couldn't find him anywhere, Miss Tapscott.—Come back, dearie. You mustn't go in there—mummy promised that you wouldn't.—Please forgive him, Miss Tapscott; I'll see that it never occurs again.'

'Oh, he ain't hurtin' nothin', and he's sort of been company,' admitted Miss Jo grimly. 'I'll allow it's ag'in' regulations, but I guess it won't kill nobody for once. The storm blew down the fence, and his kitten ran in here. I've give him some cherries to make a pie of. He says him and you likes cherry-pie, and—well, there's more fruit than I kin use anyway, so you're welcome to it.'

'Thank you so much; it's very kind of you.—Come, Wally dear.—Can't we send you some of our roses in return, Miss Tapscott? They are in the very perfection of bloom.'

'I've told you once I hate roses!' snapped Miss Jo resentfully. 'My bread's in the oven, and I ain't got no time to talk. Good-mornin'.'

And with this ungracious parting she walked away and went back in the direction of the house. But although the rest of that day was passed in the regular routine which had marked all her days since the time of her coming into her inheritance, and garden and orchard offered her the same inducements as ever, somehow or another they offered them in vain; the day didn't seem quite like all the other days, and she was conscious for the first time of a wee little shade of loneliness—conscious of missing a piping little voice keeping up a running fire of questions and comments, of a little yellow head nodding at her while she pruned and weeded, and of a soft little hand brushing hers when she dropped bits of rubbish into the leaf-basket.

And so it fell out that the gap in the fence was not mended that day, nor yet the next, nor the next again; and, although no storm came to strip the cherry-trees of their scarlet treasure, each morning unfailingly there was a scattered mass of 'windfalls' lying on the grass beneath the trees at one particular spot—an utterly irresistible temptation to the lonely little figure that went past the gap in the fence at the hour when 'mummy slept, and her head was bad,' and Wally boy and 'Kitty' were left to entertain each other in the garden.

At such times Miss Jo would always swoop down with her grenadier stride and catch the young intruder, and 'allow' grimly that 'You ain't got no right to come in here, and I'll hev' to remember to nail up them boards. But now you are here, you may as well stay and help me do my weedin', to pay up for it.' And always—just before mummy was due to wake up and come out into the garden—Miss Tapscott would bundle boy and kitten back through the gap and ungraciously submit to a parting kiss as she ordered the child to 'Be off now about your own business. And don't you dare ever come in here unless it's to pick up windfalls. I'm goin' to nail up this hole soon's ever I kin git time to remember it—I really am.'

But, although June passed, and July came and deepened, and August drew near, her memory never appeared to jog her with regard to that particular piece of mending, and the gap was still unclosed. But, more wonderful than this, the windfalls continued without the slightest intermission, no matter what the state of the weather overnight might be; and when the cherry season was over these marvellous trees dropped apples or plums or peaches, as the mood seized them, with a daring defiance of

nature which could have deceived no one but a child.

In this way July followed June, August came and August went, and by the time September, with its grape-scented air, filled Miss Jo's garden with rafts of white and red and purple China asters, Wally boy's visits—beginning with one per diem, and growing thence to two, had increased to three—one in the morning, one directly after noon, and the third just before twilight came—for 'mummy's' headaches had increased in frequency, until 'mummy' seemed to pass most of her time in sleeping these days, and even the sound of her voice was seldom heard in the now almost bloomless rose-garden on the other side of the dividing fence.

'I ain't no patience with her, lollin' around and lettin' you take keer of yourself,' commented Miss Jo one day when the child came toddling up the orchard-walk with his pinafore awry, his hair at sixes and sevens, and the cheek against which he held the kitten all smudged with blackberry-stains. 'You ain't been washed since lunch-time, and them there holes in the knees of your stockin's is jist the way they was two days ago. Who put that apron on yer? Done it yerself, didn't yer? Yes, I thought so! Turn around and let me look at you. Sakes alive! there ain't but one button on it from top to bottom. Well, of all the shiftless, idle, good-for-nothin' wimmen ever *I* heard of, I reckon your ma takes the cake. Stand still a minute till I wash your face and run my pocket-comb through that untidy *mop!* Agreement or no agreement, I'm goin' round to give that woman a piece of my mind. It's puffickly scandalous the way she lets you go. A good sound talkin' to is what she needs, and she's goin' to get it, too, or I'm a Dutchman.'

In this manner the spinster discoursed as she set to and made the child a little more presentable; and, this done, she took him by the hand, marched down the orchard and through the gap, and, with fire in her eye, bore down on the porch where Mrs Thorburn slept in a deep old rocking-chair, with her thin hands loosely folded and a bunch of late-blooming roses in her lap.

She awoke at the sound of Miss Jo's coming, and looked up with her great hollow-ringed eyes and her faded and wasted face; and at sight of her all the fires of resentment died out of the spinster's breast and a great pity—a great fear—filled it instead.

'For Heaven's sake, child, why didn't you let me know you was so bad as this?' she exclaimed contritely. 'I never see nobody change so in a short time in all my born-days. What on earth be you a-settin' out here for, in your state of health? My goodness! you look as though you was on the p'int of givin' up the ghost.'

'I sometimes think I am,' said Mrs Thorburn pathetically. 'I don't think I'd mind if—if it were not for my baby. I miss Walter so much! I've missed him every day since we were divided.'

'Missed fiddlesticks!' sniffed Miss Jo contemptuously. 'There never was a man yet that was wuth a woman a-dyin' for. What you want more'n all the fiddle-faddlin' "Walters" that ever hampered up the world is a mustard-plaster, a bed, and a bowl of hot gruel; and I'm goin' to give 'em to you, too. —Open that door, sonny, and show me the way to your ma's room. I'm goin' to put her to bed, where she belongs.—What's that? Heavy? Goodness, child, you don't weigh more'n a pint o' nuts, and I kin carry yer as easy as turnin' a pancake. Or, wait a bit! Mebby I'd better run in and git the bed ready first. Ugh!'—with a sudden shudder of repulsion—'chuck them dreadful roses away, for pity's sake; the smell of 'em makes me sick—makes me hate everythin' in the world—everythin' and everybody.'

'They were always Walter's favourites,' replied the widow wistfully. 'I love them for that as much as for their beauty. He was such a good man, Miss Tapscott, so kind and tender and true, and his passion for roses was almost worship.'

'I never knew but one man like that, and he—well, hangin' was too good for *him!*' asseverated Miss Jo, her face darkening and hardening, and the creases tightening about her mouth. 'Killed a woman's whole life, he did; and there ain't no murder worse'n that. She was a deal older'n him, and had a little money laid by. Not much; jist enough to keep her when she growed old; but he laid his plans pretty good, and she was a fool, and fell into 'em. Made her think he loved her, he did; got her to draw out her money and give that and some trinkets that had been her mother's into his keepin' jist the day before the one that had been set for 'em to be married. She never see him ag'in after that. He run and left her, takin' everythin' she had in the world. *He* loved roses—that man—they was a reg'lar passion with him. I tell you I wouldn't trust a man who loved roses further'n I could see him after that.'

'You would if you had known Walter, Miss Tapscott; I'm sure you would. Wait! Let me show you. He had the noblest face, the noblest character, that ever was. Look!'—fumbling at her collar and drawing up from its hiding-place a queer, old-fashioned, flat gold locket attached to a fine thin chain—'he gave me this when we were married. It was his dead mother's. Here's the T. that stands for Thorburn, see!'

Miss Jo did see. She was looking with eyes that were large and round and full of a curious light. Her thin face had grown oddly white; her nostrils were expanded and her mouth pursed up until it looked like a little red eyelet set in a face of dough.

'Look!' said Mrs Thorburn, opening the locket and holding it out on the palm of her hand. 'It's Walter's picture. Could any one look into a face like that and not love and trust it, Miss Tapscott?'

'I dunno,' replied Miss Jo, moistening her lips

with the tip of her tongue and speaking in a queer, shaking, far-away sort of voice. 'I ain't much of a judge of people's looks. 'Scuse me. I've jist remembered I've got company comin', and I believe there they are now.'

Then she turned and went quickly down the garden-walk, passed through the gap in the fence, caught up the displaced boards, and with a stone nailed them back into position again, and, sinking down on the grass under the cherry-trees, laid her folded arms across her knees and her forehead upon them, not saying one word, not making one sound.

The afternoon wore away; the twilight came and went; the night fell with solemn hush and the magic of twinkling stars; then, all of a sudden, there sounded a mighty crash—repeated again and yet again; and as Mrs Thorburn, startled by the sound, left Wally's bedside and came out upon the veranda and looked down the long, bright garden-paths, lo! a shower of flying wood cut through the air and crashed into the rose-bushes, and there in the moonlight stood Miss Jo, armed with a long-handled axe, beating and banging and cutting into the dividing fence and levelling it from end to end.

'Oh Miss Tapscott, what in the world are you doing?' exclaimed Mrs Thorburn in amazement.

'Sort o' comin' to my senses, I reckon,' replied Miss Jo, as she swung the axe round and sent another board flying. 'It ain't nuther Christian feelin' nor yet common-sense for us two lone wimmen to go on livin' like this. You need a nurse to brace you up and fetch you round to health ag'in, and I need—the boy! The Lord's showed me the way, Mrs Thorburn—He truly has!—and I know now that there ain't nothin' in the world like fetchin' up a *good man's* child in the way he should go to keep a critter from growin' sour and *un*human. I guess there's somethin' of the mother-feelin' set in a woman's heart and nature whether she's cut out for an old maid or not. Anyways, this here fence is comin' down for good and all, and me and you is goin' to bring up that boy together and make a good, God-fearin', honest man of him.'

'Like his dear father, bless him!'

'Better!' said Miss Jo, as she swung the axe with redoubled vigour. 'At least, better if better kin be—which, from what you say, I don't suppose it kin!'

THE END.

THE OLD MANSIONS OF PARIS.

II.

ON the other side of the Rue de Rivoli, remote from the Île de St Louis, there is a little, narrow street which bears the name of the Rue des Francs-Bourgeois. This title carries us back to the Middle Ages and the intricacies of the feudal times. The *bourgeoisie* of the medieval period had their grades as well as the *noblesse*. They were more or less subject to the will of their lords; but the *franc-bourgeoisie* were altogether free, and could change their abode or their master according to their own will and pleasure. They gave their name to two streets in old Paris, of which this one retains its ancient title. Here are to be found some buildings of divers periods which contrast strangely with the modern houses.

At the corner of the street of the Rue Vieille-du-Temple is the Hôtel Barbette. This house is linked with a tragic scene in French history. It was the residence of kings and queens. Here resided Queen Isabel of Bavaria, the wife of the mad King Charles VI. (1380–1422). She was a bad woman, who treated her insane husband with gross cruelty, keeping him in close confinement, while her behaviour to him rendered his malady worse. She loved and schemed for Louis, Duke of Orléans, the king's brother, and shared with him the government of the realm during the illness of the king. He often came to her at this Hôtel Barbette, and many affairs of state and of love were enacted in the old mansion. But the Duke incurred the wrath of John the Fearless, Duke of Burgundy, who was his rival in power. One day, as Louis was leaving this house and riding out by the gateway, he was attacked by the servants of the fearless Duke and assassinated. Far-reaching were the effects of the murder at the gates of the Hôtel Barbette. The Duke gloried in his deed, hired a famous preacher to vindicate it, surrounded himself with a body-guard of butchers, and boldly walked about Paris with them. Soon we see him entering the Hôtel Barbette, and being well received by Queen Isabel, whose lover he had slain. Of the factions that arose which led to the coming of Henry V. to France and the battle of Agincourt, and of the proclaiming of our English Henry VI. king of France, we need not tell; but you may be sure that this house witnessed many scenes of historic interest and many anxious negotiations.

Little is left of its former glories. The turret at the corner of the street is the part best preserved. It is ornamented with rich arcades, and the window has its primitive grating. You can see the central archway which leads into a sort of bystreet which appears to be a *cul-de-sac*. Squalid cottages appear on each side, the walls of which preserve the ancient walls of the Hôtel Barbette, the former residence of kings. Not long ago, between Nos. 18 and 16 in this street, there was a narrow passage with

three stone steps which had seen many generations of steeds and been used by many people for mounting their horses. Queen Isabella used them to mount her palfrey, and Nicholas the Bailiff was accustomed to rise more slowly in his stirrup when he rode his mule. He was the Auditor of the Accounts of Louis XVI. He had for his neighbour Thomas de Rentilly, captain of the Grenadiers of the Royal Guard, who received the property from his father-in-law, Leclère de Grandmaison, Treasurer-General of War. After the captain of the Guard came Mascarany de Lavalette, and then Langois de la Fortette, President of the Court of Accounts. Richer de Boismauclair owned the house at the time of the great Revolution, having inherited the property from Thébault de Baurain.

In this street there is another house which is famous in history, and bears the name of the Hôtel de Gabrielle d'Estrées, the beautiful but frail lady who became the mistress of Henry IV. Outside the house the bust of that monarch proclaims his connection with its fair owner, and that here she received some visits from her royal lover. If this house wrote its memories it would have many strange stories to tell. It would state that during the reign of Louis XIII. it was owned by Étienne Briois. M. de Bordeaux was the proprietor when Jacques Gomboust designed his plan of Paris, and by marriage it passed to Louis Sanguin, Marquis de Livry. Thomas de Pange sold the house in 1754 to Michaut de Montaran, Dean of the Grand Council and Treasurer of Brittany; and then it was acquired by Charles Chartel, Treasurer-General of Artillery. United with the house was in former times its next-door neighbour, rebuilt by M. de Livry after the designs of Boffraud in 1709. It was separated from the other house for the residence of Chancellor Voysin, whom Madame de Maintenon had made Steward of St Cyr after the dismissal of De Chamillart. The last Duke of Roquelaure, the little son of him who had so strongly urged King Henry IV. to leave his mistress, Gabrielle d'Estrées, was installed in this *hôtel* after the decease of Chancellor Voysin. The inheritor of a great name and the hero of many military achievements, he was raised to the dignity of Marshal of France; but he left only two daughters to uphold the traditions of his noble family. The house has preserved its sculpture and its balconies, and is now police-barracks.

The next house was formerly known as Le Mayrat, and was occupied by President le Vallier and by President Poncet, Marquis de Louvois, Governor of Navarre, Master of the Garderobe of King Louis XIV. It was sold to William de Couchant, captain of the Guard, in 1740.

Close by, in the Rue Pavée, is the once famous Hôtel de Lorraine, called also at various times Hôtel Savoy and Hôtel d'Herbonville. It was begun about the year 1550 for or by the celebrated Diana of Poitiers, the beautiful lady who won all hearts and exercised a powerful influence over the weak King Henry II. Some say that she was his mistress, and that she sold her honour to the king in order to save her father's life, who was condemned to be executed on a charge of treason. Married to an old man, Louis de Brezé, her life was not happy, and she had many admirers. Her influence was quite predominant at Henry's Court. She was created Duchess of Valentinois. This house, which is now devoted to trade and industry, retains many marks of its former grandeur. The building was finished by a natural son of Charles IX., Charles de Valois, Duke d'Angoulême, a name famous in history. He was the son of Marie Touchet, who lived in a little house in the Rue des Barres, and readers of Dumas' *Henri de Navarre* will remember the king's visit to his mistress. That little son, had he been legitimate, would have prevented the succession of Henry III., Henry IV., Louis XIII., and Louis XIV., and have changed the course of the history of France. He fought bravely on many a battlefield, was engaged in divers conspiracies, and once nearly lost his head. The house looks imposing in spite of its degradation. The principal part of the building is decorated in the Corinthian style, flanked by two wings, one of which has been partially restored. The walls are ornamented with bas-reliefs, and, in allusion to the famous Diana, the sculptors have represented many crescent moons and scenes of the chase with heads of deer and dogs. Amongst other famous owners of the house was Constable Anne de Montmorenci, a prominent noble of the Court of Henry II., the rival of the Duke of Guise, who is said to have laid the first stone of the mansion and to have constructed the staircase. Phebus d'Albret, Count of Miossano, Governor of Bordeaux and Marshal of France, died here in 1670; and Brunet de Chailly, Guardian of the Royal Treasure, lived here. It takes its name from the President of Lamoignon, who bought the house in 1684. Here was installed in 1763 the first library of the city of Paris.

The little Hôtel D'Albret in the Rue des Francs-Bourgeois is worth noticing. It is in the style of the Renaissance, and has an eighteenth century staircase with beautiful ironwork.

The best-preserved house, and one of the finest in this street, is the Hôtel Carnavalet, now a museum, in which are preserved many objects of interest relating to the history of Paris. The entrance is in the street once known as Culture Sainte-Catherine, now called the Rue Sévigné after the distinguished lady who once inhabited this noble mansion. It is unfortunate that the name of the priory of St Catherine-au-val des Ecoliers should have thus been obliterated. The house stands at the corner of the Rue des Francs-Bourgeois and the Rue Sévigné. It was commenced in 1544 by Jacques des Ligners, President of the Parliament of Paris, and representative of France at the Council of Trent. Two great artists of the period—Pierre Lescot, architect, and Jean Goujon, sculptor—were employed in its construction. After some years

they were summoned by the king to carry out some works at the Louvre, and were succeeded by the architect Jean Bullant and some pupils of Jean Goujon. After the death of the founder in 1556, the unfinished house was bought by Françoise de la Beaume, Countess of Montreval and widow of François de Kernevenoy, a great Breton lord, who, according to Montaigne, had no equal in the management of a horse; he was the esquire of King Henry II. and the tutor of the Duke of Anjou, afterwards Henry III. Kernevenoy was known at Court by the name Carnavalet, which his widow retained and conferred on her mansion. The house has been much altered since her day, but it is possible from old engravings and descriptions to form some idea of its state at that period. The principal part of the house was of two stories, as you see it to-day from the courtyard, with its imposing bas-reliefs and its high windows. There were wings on each side and a front facing the street; but all these were only ground-floor rooms surmounted with beautiful dormer-windows and high roofing-slates. There was a beautiful staircase which led from a *loggia* or gallery. This was painted, and received its light from the courtyard by means of arcades filled with plain glass. Grotesque faces carved by Ponce grinned down upon the spectator. A great gate opened upon the street, and inside there was a kind of triumphal arch, as we see it to-day, embellished by the delicately carved figures of Jean Goujon. The arms of the lady, supported by two little genii, appear on the tympanum of the arch. The shell of the house was there; subsequent ages have contributed to its beauty.

Madame de Carnavalet sold her house in 1602 to M. Florent d'Argouges, the Treasurer of Queen Marie de' Medici. In 1654 it was purchased by Claude Boislève, Superintendent of the Finances of the Realm, who had rapidly made a great fortune by supplying the army with provisions, a financial process which still is known to exist. The house was not great or grand enough for his fastidious tastes; so he set about its transformation with the aid of François Mansard in 1655 to 1661. Happily he retained the earlier work, and, unlike many restorers, showed reverence for the achievements of former artists. The buildings of the wings were raised, much decoration was done, and the house nearly approached to its state at the present day. Its master, however, was ruined. He was involved in the disgrace of Fouquet, and was condemned and despoiled by the Chamber of Justice. The house passed in 1662 into the possession of Gaspard de Gillier, who assigned it to his brother-in-law, M. d'Agaurry, a gentleman who was interested in the affairs of the king and occupied the position of Collector of Taxes. He let the house to François-Marie, Prince of Lorraine, Count of Lillebonne. The Prince was usually fighting on foreign battle-fields, but his wife and his two daughters lived here in strict retirement. These little girls were taught to regard themselves as princesses, and Madame de Sévigné and the Court gossip, Saint-Simon, used to laugh at their pretensions and ridicule their ambitions. Madame de Sévigné was determined to gain possession of the Hôtel Carnavalet—'*chère Carnavalette*,' as she loved to call it. She accomplished her will, and set up a *salon* which was frequented by most of the famous men of the day—Retz, La Rochefoucauld, Arnauld de Pomponne, Seguier, Turenne, Condé, Bossuet, Bourdaloue, and many others. Here with her lived her daughter and son-in-law, the Countess de Grignan and M. de Grignan, and her uncle, the Abbé of Coulanges, each having a suite of apartments.

Since that time other changes have taken place in the old building. In 1698 Brunet de Rancé took possession and employed several renowned painters to decorate some of the rooms. He gave it to his daughter, the wife of Pierre Arnaud de la Briffe, in whose family it remained until the time of the Revolution approached. Afterwards it passed through several vicissitudes. It was at one time a library, then a school, and then in 1866 the city purchased it for a museum.

The house, in spite of the changes which have taken place, is a perfect example of early seventeenth-century French domestic architecture, and the carvings and sculpture which adorn it are worthy of close examination. On the first story are four beautiful bas-reliefs representing the Seasons, with the signs of the Zodiac. The right wing of the house, of which the ground-floor only belongs to the Renaissance period, has curious grotesque heads carved on the keystones by Ponce, representing fauns and satyrs, and above them are bas-reliefs of Juno, Hebe, Diana, Flora, and the Four Winds. Ponce's grotesques appear also on the left wing.

There are so many sculptures attributed to Ponce in the sixteenth century that he must have been a most prolific artist. Perhaps there were several carvers who bore that name. One man could scarcely have accomplished all. The question is difficult.

Three beautiful bas-reliefs by Goujon adorn the entrance-door in the left wing, leading to the principal staircase. The bas-reliefs on the first story represent the Four Elements, Earth, Air, Fire, and Water, and are the work of Van Obstal, whose art we have seen elsewhere. He was the Flemish sculptor whom Cardinal Richelieu brought to Paris, and who did much work at the Louvre. At the side of the entrance there are figures by Goujon representing Authority, a figure standing on a globe and holding in her hand a yoke and a staff, two tame lions, baskets of flowers, and Flora. A statue of Louis XIV. now stands in the courtyard, conveyed here from the Hôtel de Ville.

The ground-floor of the part facing the Rue Sévigné has on the keystone of the portal a figure of Abundance by Goujon, with a carnival mask,

a playful allusion to the name Carnavalet. On the tympanum are little genii bearing palms and holding an escutcheon. Submissive lions appear on the right of the doorway. Why are they so represented? We generally see lions roaring, *regardant*, fiercely defying the world. These figures were intended to signify the obedience which a good citizen should render to the laws of his country, to Right, Justice, and the King. On the first-floor stands Vigilance holding a lamp, a cock, a winged frontlet, and a spur; Resolution, holding a club, leaning against a shield, with an open book of the law; and a statue of Minerva. Facing the Rue de Francs-Bourgeois is a bas-relief by Van Obstal, representing Wisdom and Love bringing back Peace and Abundance, alluding to the marriage of King Louis XIV. with Maria Theresa, daughter of the king of Spain, and the treaty of the Pyrenees. The garden of the house contains some additional rooms recently erected for storing the relics of old Paris, and here may be seen several interesting buildings of the city which have been removed to this site. There is the Arc de Nazareth, which formerly stood near the Palais de Justice, the Bureau des Drapiers, and the Pavillon de Choiseul, a fine specimen of the architecture of the age of the Grand Monarque.

Paris contains many other interesting old houses and mansions which are little known, and have to be diligently searched for by those who wish to study the ancient domestic architecture of France. Perhaps in these two articles on the Old Mansions of Paris enough has been said to whet the appetite of the curious and to interest strangers in the study of one of the most attractive features of the capital of France.

A SPANISH ROBINSON CRUSOE.

By JOHN D. LECKIE.

ALTHOUGH it is generally believed that Defoe's *Robinson Crusoe* is founded on the experiences of Alexander Selkirk, a Scotch sailor who was put ashore on the island of Juan Fernandez—which is said to have disappeared during the recent earthquakes on the west coast of South America—this is a mere supposition. According to Defoe's own account, Robinson Crusoe's island lay somewhere near the mouth of the Orinoco, in the Caribbean Sea. It so happens that there exists the account of a shipwrecked Spanish sailor who was cast ashore on an island in the Caribbean Sea, on which he spent seven years before he was rescued.

The account is given by the famous Spanish historian Garcilaso de la Vega. In the original Spanish narrative, from which the following is taken, the date on which the sailor was shipwrecked is not stated, but from certain facts in the narrative we are led to believe that it took place about the beginning of the sixteenth century. An English translation of the *Commentarios Reales* of Garcilaso de la Vega (from which the following account is taken) appeared in the year 1688; and as Defoe's history of *Robinson Crusoe* was published in 1719, it is not improbable that he read the account given by the Spanish historian, and that it furnished him with the idea, in whole or in part, of his immortal work.

The experiences of the Spanish sailor Serrano are in many ways much more wonderful than those of Selkirk; for whereas Juan Fernandez is an island well wooded and watered, and abounding in game, the island on which Serrano was wrecked was a mere sandbank, entirely devoid of wood and water. Robinson Crusoe when he was cast ashore on his desert island had a large supply of stores and tools at his command, which he took out of the wreck of the stranded vessel. Serrano, on the other hand, was cast ashore with no other implement than the knife which he carried in his belt.

It is interesting to follow his account, and to know how a man stranded in this primitive condition not only managed to survive, but even to live for seven years until he was rescued by a passing ship.

The Spanish chronicler states that the islet (or islets) which are known under the name of Serrana—having been so named in honour of the sailor aforesaid—lie in the track of vessels bound from Cartagena to Havana; but this seems to be a mistake on his part, as the Serrana islets or *cays* (as low sandy islets are generally called in the West Indies) lie nearly a thousand miles to the southward of Havana, and are therefore not in the direct track of vessels bound from Spain to the capital of Cuba.

We give the following account as nearly as possible in the words of the Spanish historian.

Pedro Serrano was a sailor in a Spanish vessel bound to the Caribbean Sea. The ship in which he sailed was wrecked on one of the dangerous sandbanks which abound in the neighbourhood of the islets. Being a skilful swimmer, he got ashore, and was the only one who was saved of all the crew. He found that the islet on which he had been stranded was little more than a sandbank, without a permanent supply of either wood or water. The islet at that time had no name; it is therefore probable that it was remote from the track of commerce, as indeed it is to-day. The Serrana *cays* are laid down on the chart as three small islets surrounded by numerous sandbanks, and are avoided by all kinds of craft on account of the dangerous shoals with which they are beset.

So barren was the islet that it did not even contain a blade of grass with which he might perchance satisfy the pangs of hunger. The first night he passed in the most dreary manner, lamenting his misfortune, as he seemed only to have escaped death by drowning to suffer an end still more terrible—death from starvation. At daybreak the next morning he resolved further to explore the island, and he was fortunate enough to find a quantity of shellfish—as crabs, shrimps, and the like—of which he caught as many as he could, and ate them raw, not having the means of kindling a fire.

The seas in the neighbourhood abound with the finest green turtle, the animal so beloved of aldermen, which proved to be the salvation of our shipwrecked mariner. The first turtle he saw crawling up on the beach was welcomed with enthusiasm, for here he perceived a means of supplying himself with an abundant supply of food of the richest kind. When the turtle had crawled some distance away from the water, doubtless with the intention of depositing her eggs in the sand, as is her wont, he attacked her and turned her on her back, a position in which these animals are perfectly helpless and incapable of moving. Then he drew his knife, cut her throat, and, famishing with thirst as he was, drank greedily the blood which poured out of the wound. Other turtles continuing to arrive were treated in the same manner. He had now more meat than he could consume; the surplus he cut into long strips and dried in the sun, in the manner of the dried meat used in the West Indies and South America, where it is known as *tasajo*. But the meat was not the only advantage he derived from the turtles. He felt sorely the need of a vessel for storing up the rain-water which falls abundantly in those latitudes, but which was immediately absorbed by the sandy soil. This want was supplied by the shells of the turtles, which formed admirable receptacles after he had extracted the meat.

In this way he passed the first few days killing turtles. Some of these were as large as the largest shields, and others the size of bucklers. The mention of shields and bucklers seems to indicate, as do also other details, that this shipwreck took place about the beginning of the sixteenth century—in fact, not long after the waters of the Caribbean Sea had commenced to be furrowed by the keels of commerce; for towards the close of the same century shields had already become obsolete, though small round bucklers continued to be used by the Scottish Highlanders as late as 1745.* Some of the turtles were so large that with all his strength he could not turn them over on their backs. He tried the effect of mounting on their backs or getting astride of them, but the animals simply dragged him along with them into the sea. In the turtle-shells he stored a considerable quantity of water, as some of them held more than six gallons.

Having solved the important problem of how to obtain a supply of food, he next set about devising some means of producing fire, for so far he had been compelled to eat all his food raw. With the fertility of resource which marks the stranded seaman, he commenced to search for one or two pebbles or flints, with which he could create a spark by striking them against the steel back of his knife, but his search was in vain, for in the whole island he found no pebbles larger than coarse grains of sand. This fact did not discourage him, for, being a skilful swimmer and diver, he set to work to explore the bottom of the neighbouring sea, diving here and there until he was fortunate enough to find some pebbles, of which he selected the most suitable for his purpose. Still he was unable to produce fire with them, as they were too much rounded by the action of the water. With infinite trouble he managed to split one of the pebbles, and by striking the angular surface against the edge of his knife he was overjoyed to find that it produced sparks of sufficient size to give hope that he could kindle a fire. After having overcome so many difficulties, the production of fire from the spark was a comparatively easy matter. He tore a piece of his garment into shreds to serve as tinder, and after many vain attempts he at last succeeded in creating a flame. That must have been a red-letter day in his solitary life, for with fire at his command he now passed from the existence of an animal to that of a man. His next step was to collect carefully such scraps of wood and rubbish as the waves cast up on the shore, and with this material he made a fire with which to cook his food. In order to prevent the rain from extinguishing the fire which he had created with such great pains he built a kind of hut over it with the shells of the turtle he had killed, and he watched the flame with incessant care so as not to let it go out.

Serrano had not been two months on the island before he saw himself reduced to a state of nature, for his scanty clothing was now worn to shreds. In that latitude, however, one suffers more from the heat than from the cold. When his body, exposed to the rays of a tropical sun, suffered from the intolerable heat he refreshed himself by taking a bath in the sea, for not only did he suffer from a lack of clothes, but there was not even a spot in the island which afforded shelter from the sun's rays. In this respect he was infinitely worse off than Robinson Crusoe, who, when his clothes gave out, made new ones from goat-skins.

In this manner three years passed. During this time several ships passed in sight of his island; but, although in every instance he made a large bonfire to attract their attention, they gave him a wide berth, either because they did not perceive the smoke or else because they feared the dangerous sandbanks which surrounded the island. Serrano at times was so disconsolate at his fate that he

* *Chambers's Encyclopædia*: article 'Shield.'

deliberated whether it would not be better to end his miserable existence by throwing himself into the waves. His body being continually exposed to the inclemency of the weather, his hair grew so long that he appeared as hirsute as a bear, while his beard extended below his waist.

After three years of this exile, Serrano was cheered by the arrival of a companion to share his dreary existence. One morning he was surprised to see the figure of a man who had been shipwrecked the previous night and had escaped on shore by clinging to a plank. At daybreak he perceived the smoke which proceeded from the fire Serrano had made; and, guided by this sign, he came in sight of the solitary Spaniard. When the two men saw one another it is difficult to say which was the more frightened of the two. Serrano imagined that he saw the devil in human shape come to tempt him; while the other jumped to the same conclusion, and not without reason, for he saw a being naked, dishevelled, and covered with long hair, who could scarcely pass as human. Each man fled from the other, Serrano exclaiming, 'Oh Lord, deliver me from the devil!' When the other heard this he took heart, and said, 'Do not flee, brother, for I am a Christian like yourself;' but seeing that Serrano still had misgivings, he commenced to repeat the Creed, which the former hearing, he turned and embraced the new-comer with effusion as a brother in distress.

Serrano, suspecting that his new acquaintance must be suffering from the pangs of hunger, set food and drink before him, which he devoured ravenously, and they commenced to talk of their adventures and to console one another in their distress.

Serrano, now having a companion, found a great burden had been lifted from his existence, and the two employed the time in company in searching for shellfish, driftwood, and other means of sustenance, taking turns in watching over their wretched fire, that it should not become extinguished.

The author of the *Bab Ballads* recounts the case of two shipwrecked mariners who met on a desert island, but being perfect strangers and not having been introduced, would not speak to one another. By tacit mutual consent each one kept to his own side of the island, until one day No. 1, happening to soliloquise, mentioned the name of Robinson, an old schoolfellow. Hereupon No. 2 exclaimed, 'Excuse me, but I knew Robinson.' The ice being thus broken, the fact of their possessing a mutual acquaintance formed a bond of companionship. But not long afterwards a boat was seen to approach the island, and a man in convict's garb stepped ashore. Both acquaintances at once recognised the new arrival—it was Robinson! The tie which had been formed was instantly severed, and the two acquaintances again cut each other dead, each one keeping to his own side of the island.

Something similar happened in the case we are now describing. Serrano and his companion quarrelled over a trivial matter, one having blamed the other with having neglected some insignificant detail of his work. Thereafter came a dissolution of partnership, and each one cooked and foraged for himself. But it was impossible for two shipwrecked mates to continue for any time in this condition of mutual enmity, and they ended by begging each other's pardon and became friends as before. During their period of companionship they saw several ships pass, and made the usual signal by kindling a bonfire; but the vessels went on their course unheeding, as previously, which plunged them into the greatest despair.

Seven years after Serrano had landed on the island he saw a ship pass so near that they perceived the castaways and lowered a boat to rescue them. Serrano and his companion, who meantime had become as naked and hirsute as the former, feared that the new arrivals might be frightened at their savage appearance and flee at the sight of them. They therefore commenced to recite the Creed, which alone saved them from being once more abandoned, for their rescuers could scarcely believe that they saw human beings before them.

Serrano's companion died on the voyage to Spain, but he himself arrived safely and afterwards travelled to Germany, where the Emperor (apparently Charles V.) was at the time. The Emperor conferred a pension on him, but he did not live long to enjoy it, dying soon afterwards in Panamá.

Garcilaso de la Vega adds that this narrative was related to him by a person who knew Serrano, and had often heard him relate his adventures.

TO NEPTUNE.

Lord of the Ocean! Spirit of the Air!
Command thy favouring breeze that it may blow
Our ship to port, to where fresh waters flow
Into the salt, which, mingling, soon will share
Thine ocean's rest. Thus, also freed from care,
Our hearts may find the friends of long ago.

What joy to tell our friends of derring deed,
Of many journeyings o'er hill and dale!
How will they clap their hands, their faces pale
With horror, or, entranced, bestow full meed
Of praise upon our magic words, which lead
Them far afield, held spell-bound by our tale!

What joy to hear again familiar names,
Familiar voices, lingering o'er our own!
To sit beside that ancient hearth of stone,
Where as of yore the huge log bursts with flames,
Where goblin forms with memory play their games
And trick us to believe we ne'er were gone!

Ah, Father Neptune! hast thou too a home,
Perchance bedecked with fair mermaiden hair?
Or is thy habitation everywhere?
The roof above thy head the mighty dome
Of sky, beneath thy foot the ocean foam?
Where'er thou art, great Neptune, grant our prayer!

UNEMPLOYMENT.

NEARLY two thousand years ago was spoken the parable in which a certain householder asked certain labourers, 'Why stand ye here all the day idle?' and they answered, 'Because no man hath hired us.' Five times in the course of that day did the householder send a batch into his vineyard, so greatly did the supply of labour exceed the demand. Here was unemployment. Yet the atmosphere of the parable is calm; there is no hint of distress; the whole reads like an idyl. How explain this contrast to unemployment as we know it to-day?

Jerusalem and the other places to which pilgrims resort are of course very different now from what they were nearly two thousand years ago; but industrial Palestine remains the same—a land of pasturage and agriculture. In describing it, therefore, we use the present tense.

The population is concentrated in small towns and large villages, so that the landscape is not dotted with dwellings, cottage or mansion, as in England; for in Levantine countries isolation is associated with insecurity. Directly or indirectly, all the people live *by* the land, none of them *on* it. The town population is thus largely agricultural, and the village population wholly so; and from both town and village, morning witnesses an exodus of labourers landwards, leaving the towns half-empty and the villages all but deserted, until the evening. Unlike our navvies, the labourers of Palestine are thirled to the soil, being small landholders; and they differ from migratory labourers in character, being conservative in sentiment and regular in their habits.

In the family of the small landholder there arises, according to the number and sex of his children, a surplus of labour, which finds outlet on the big landholder's estate. The labourers of the parable must, therefore, be thought of, not as waifs caring for nobody and for whom nobody cares, but as sons or less near relatives of men, small indeed, but of assured position, who at close of day would welcome their lads back to bed and board, whatever might have been their fortune in the market-place, that spacious rectangle where, in every town and in the larger villages, buying and selling go on in the open air, and wanters and wanted congregate on market-days.

It thus appears that the unhired labourers of the parable correspond, not to the unemployed who, there being no bread in the house, cry out in the street, but rather to the silent unemployed of the great middle-class, familiarly represented by the briefless barrister. If this typical gentleman have ample private means, patience is his only trial; but there are countless would-be workers of both sexes in the middle-class, in whose case patience is attended with hardship, impelling them to hunt for work inferior to that for which they have qualified, in order to supplement the scanty private means, their own or of the family they belong to, on which meanwhile they live. It is thanks to these silent unemployed that vacancies in public and private offices can be filled up at once. If they miss the post vacated, some other one awaits them; for otherwise, after no matter how many removes, the situation could not be restored. How great is the service thus rendered to the community appears in the disaster that has overtaken the Free Church of Scotland, through dearth of the silent unemployed known as unplaced probationers. Some two score of its congregations remain without a pastor!

For distinction's sake, let us call those who claim public relief the 'clamorous' unemployed. They consist of two sections—namely, casual labourers out of a job, and regular workers out of a situation. Whence comes their unemployment? The sources are various, and variously affect the two sections.

Affecting both sections, the intemperance, wastefulness, and improvidence of individuals conduce, one might say conduct, to unemployment; strikes and lockouts inflict it on both. Affecting regular workers, the trades-union insistence on a uniform wage, whereby degrees of efficiency are not marked by differences of pay, places elderly men, and those

 [*All Rights Reserved.*]

suffering from only a slight though chronic complaint, on the brink of unemployment; with the result that many who could, and gladly would, have accepted partial wages for partial work topple over. Affecting the casual labour section, the birth of natural casuals brings continual accession to its numbers. These are they whose nature it is to shirk continuous work, so that only spurts can be got out of them, *dolce far niente* filling up the intervals. They are of the same breed as the 'ins' and 'outs' of the workhouse, the tramps who spoil the amenity of country life, and the 'ne'er-do-weels' of the middle-class. Not settling to any study or business at home, these last are sent abroad, if haply they might in a new environment become new creatures. But a situation is obtained only to be lost; and they dawdle through the years, subsisting mainly on remittances from home, so that—in Canada especially—they are spoken of as 'remittance-men.' When they survive the remitters, casual labour alone is open to them, with unemployment staring them in the face.

One great source of unemployment lies in the substitution of machinery for hand-labour and the invention of new processes, whereby the output is both increased and cheapened. The ruin that waits on these two changes, or on either, is measured by the extent of the industry affected. Witness the sacrifice of a whole generation of textile workers in the first quarter of the nineteenth century, when the power-loom superseded the hand-loom. Not only in the back-streets of towns and in villages, but also in the homesteads of small farmers, the whir of the shuttle had been the sound of daylight. The mere weaver soon succumbed; and though the farmer-weaver struggled on, necessity in the end made him give up his home, of which nothing—when anything—now marks the site save roofless, crumbling walls, a stone seat, an ash-tree, and traces of a garden!

The modern phenomenon of recurrent crises of unemployment throughout the industrial world is not yet accounted for. That arises from the keenness of international competition, whereby the output of manufactured articles tends ever to overtake the demand; so that once in every ten years or thereabouts the world becomes glutted with them; whence a crisis, industrial, commercial, financial—a long-lasting crisis, for as it has taken years to accumulate the congestion, so it takes years to disperse it. When orders slacken, workers are put on half-time; and when they cease, so does work.

Like the silent unemployed, the clamorous also, especially the casual labour section, serve the community. In the words of Charles Booth: 'Our modern system of industry will not work without some unemployed margin, some reserve of labour.' How otherwise, indeed, operate our docks? Or, descending to the other end of the scale, whence would sandwich-men come forth to advertise the programmes of our public entertainers were there not unemployed within call? Here emerges an economic ground, alongside the humanitarian, for listening to the call for relief.

Emigration is no remedy. Canada and Australasia want men accustomed to farm-work and women willing to do house-work; but such are not among the unemployed. There is, however, some scope for migration within the United Kingdom, because work and the corresponding kind and number of workers are not always found together. Hence the value of Labour Exchanges, of which Germany has one in almost every town of fifty thousand inhabitants; London has twenty-three, linked by telephone to a central office. Will they ever be spread over the whole country, unless they become part of the industrial organisation of the State?

Local relief is afforded by municipalities when, in view of the unemployed, they carry out works of repair and cleaning in the slack season; but the mainstay of local relief, both here and abroad, is work on the land, which bears hard on those who have known only indoor work. A member of Parliament, compositor by trade, declared in the present House of Commons that he would rather go to prison than work on the land.

Unique among methods of dealing with the unemployed is the 'Ghent system,' which prevails in Belgium, and occurs sporadically in France and Germany. Its policy is prevention, hardly at all relief; and prevention is effected by backing up all efforts of self-help. Hence its beneficiaries are almost exclusively regular workers, because among them chiefly are self-helpers to be found. Its method is shown by the destination of its pecuniary grants as under: (1) to members of trades-union unemployment funds, a percentage on the allowance paid out of these funds to members out of work; (2) to individuals who have saved in view of unemployment, in proportion to the amount saved; (3) to savings-banks established in view of unemployment; (4) to individuals, without conditions, according to state of funds and intensity of unemployment; (5) to trades-unions that have established unemployment funds.

Our methods being still in the experimental stage, we are ready to learn from all quarters, especially from our daughter-lands at the ends of the earth, among which New Zealand holds the lead in social experimentation. If here, as there, every lad leaving the elementary school were debarred from casual labour and obliged to learn a trade; and if, even with the limitations there imposed, work at reduced wages were here also open to men no longer at their best, we should be two important stages in advance of our present position.

A PAWN IN THE GAME.

CHAPTER XXXVI.—THE UNKNOWN DEAD.

SOME six weeks after the sirocco which destroyed Hassan and his band, Jack and Sidi were picking their way through a belt of rocky country, a tangle of wild ravines. They were nearing, Jack believed, the upper coast of the Red Sea. The day had been one of intense heat. The sun's rays were flung back on them from the cliffs on either side until the pair felt like a couple of ants under a burning-glass. The ravine rose sharply, and their camels grunted and moaned with distress as they climbed. They reached the crest at last; and, in spite of the torment of the heat, Jack as he looked round felt afresh the beauty of a desert sunset.

The mountain peaks above them were crimson; the steep rocks on either hand were red. The sunset poured, a stream of flaming colour, through the ravine and splashed the tumbled rocks that strewed it with tints of blood. All the west was a flame of glory. Great bars of light, like thrusting spears flaming and broken, ran from the horizon to the zenith. Jack stopped his camel involuntarily to stare at the sight, but Sidi rode a few paces ahead, his figure showing in hard, black silhouette against the sunset.

Presently Jack noticed that he was staring down from the crest with great eagerness. He suddenly threw up his hands, as if in wonder. He plainly saw something of an unusual sort, and Jack pushed his camel forward to see. Beneath their feet was a shallow, saucer-like little valley, a floor of sand, with the black, sun-baked rocks for imprisoning rim; and strewed on the sand Jack saw with astonishment half-a-dozen bodies. They were not sleeping; the rigid attitudes told they were dead. They were not Arabs. To Jack's wondering eyes they seemed to wear a sort of European uniform.

He pushed his camel down the slope and stopped by the first of the prostrate figures. The man was dead, killed, as a glance showed, not by gunshot or spear-thrust but by thirst or heat. The face was dry as that of a mummy, and the tight-drawn, semi-transparent skin sharpened every feature. The lips were drawn back into a dreadful grin; the eyebrows were lifted as though with a look of astonishment. But what awoke in Jack a sense of bewildered amazement was the dress of the dead man.

It was that of an English marine, with belt and side-arm and cartridge-box. Jack went with ever-growing wonder from one body to another. There were seven in all, and one was plainly that of a petty officer. The body was in a sitting attitude, propped against the rock. Under the cap was a bullet-wound.

Jack sat down on a rock to stare at the sight in wordless astonishment. He could scarcely credit his senses. To stumble in the desert on the dead bodies of a group of British marines! Where did they come from? Had they fallen out of the sky or been flung ashore from some wreck?

No; it was plain they were not a wrecked party. The condition of their arms and dress proved this. They were not the fugitives from some defeat, for they bore no mark of battle or pursuit upon them. Jack remembered that the body leaning against the rock had a bullet-hole in the forehead. He walked up to it again. The pistol lay beside the dead man's hand. The wound had been self-inflicted. The man had shot himself in despair, perhaps, after seeing the rest of his party perish.

Some few hundred yards ahead, where the little ravine curved round the point of rock, another body was lying. It was that of a tall and powerful man. He was completely naked. The man's musket and some of his clothes were scattered in a line betwixt his corpse and the rest of the party.

Jack began to decipher the meaning of these dreadful hieroglyphics. The unhappy wretch was stronger than the other members of the party, and had outlived them by a little space. He had gone mad with thirst, and with an impulse common in such cases had stripped himself naked. Then he had run or staggered on till he fell.

The whole story by degrees became intelligible. The party plainly belonged to some British man-of-war. A landing had been made on the coast, and this little party had been detached for some special service. They had lost themselves, and the fierce heat of the desert had destroyed them. The dry skin on the dry bones told the whole tale.

In after-days Jack learned that this was exactly what had happened. In August 1799 two British frigates, the *Dædalus* and the *Fox*, made a dash at Kosseir, then held by the French. They cut out some dhows in the port, breached the walls of the fort itself, but failed to carry the place. Some boat-parties were sent ashore; they landed south of the town for the purpose of destroying the wells from which the town was supplied with water, and the marines belonging to one boat had got separated from their comrades and perished. These were the men whose bodies Lawrence found lying as we have described.

The light had faded in the west by this time; the whole sky had changed into a colour of faintest emerald. Here and there the white flames of the greater stars were visible, and with the coming night a weight of measureless and awful silence seemed to fall upon the little valley. The silent hills crouched under the silent skies. Noon and midnight in the desert are both marked by a strange and listening

silence; but as Jack sat with that strange company of the nameless and forgotten dead about him the stillness of the night seemed to take a yet more awful aspect.

Little had he dreamed that when, after years of slavery, he should meet his countrymen it would be in that strange form. What dark tragedies the desert held! The dead lying about him were of his own race, the sons of English villages. And from the lush meadows, the running streams, the tangled hedges, the cool skies, the blowing winds of their native land, they had found their way to this lonely spot to die under the fierce African sun. As Jack sat and meditated the Southern Cross had risen, a slanting quaternion of stars, sign of the alien skies under which the dead were lying.

Presently his thoughts took a more practical turn. It was clear the dead men came from a vessel of war. They plainly had not travelled far, for they had no camels or supply of stores. This showed that the sea was near, and a port visited sometimes by vessels of war. It was many months since they had landed, but there might be one there even now; and Jack's blood tingled with expectation at the thought. In the morning they would turn the heads of their camels to the east.

He could do nothing for the dead bodies about him. Their side-arms or the short and clumsy muskets were of no use to him. Their dress was absurdly unsuited to the climate. He would have buried them, but he had no spade for the task. The fierce African sun that had slain them must be their keeper. But Jack thought with a pang that perhaps more than one woman's heart in far-off England was torn with unforgetting grief for those who lay about him.

Sidi crouched in the sand near him. The dead bodies about him shook his nerves with fear—not that they were dead, but that they were the dead of another race, wearing a strange dress, and flung here by some strange fate. He began a negro lament, and the cadence of the wild, lamenting notes seemed to deepen inexpressibly the melancholy that filled the night and brooded over the silent dead.

(To be continued.)

A WEEK IN CANADIAN BACKWOODS.

THE railway line between Montreal and Three Rivers, in the province of Quebec, is enriched with the names of many saints; in fact, every wayside station commemorates a saint. The train proceeds deliberately. In the cars there is but one class, and the travellers are of one class. French Habitants, accompanied by very large families, get out at the stations, and others get in. If the visitor from Europe has promised himself the rush and exhilaration of the usual American railway journey, he meets with disappointment. The train crawls; the faces of the peasants wear the patient look of those who habitually travel in trains that crawl. The country—flat, cultivated, and a little drear—looks as tame and docile as the faces of the travellers. After weeks spent in the United States and large Canadian cities, there is a pleasant sense of being in a country that is not going forward, and amongst a people not struggling ambitiously into different conditions. These are rural French Canadians, a peasant people who have always been told by their priests to be contented with their lot. Perhaps the priests are right; for, though more than two million Habitants are now in the United States, they are not regarded as a success out of their native surroundings.

The stations—St Agathe, St Adile, and the rest—are far from the villages whose names they bear; these are to be seen in the distance, the spires of the churches rising against the horizon. Not one had its station near at hand. We go past saint after saint, and at last reach St Azore, a station, like the others, planted by the roadside three miles from the town of that name. This is our destination, and we get out. One quaint figure is alone on the platform, with outstretched hand and wide, welcoming smile. It is the driver who has been sent to conduct us to the spot in the Laurentian hills where we are to camp for a week. Outside the station, a foot deep in mud, stands his strange one-horse conveyance, a kind of hooded cart, with a board in front for the driver and two seats under the hood.

We are to be the guests of the Dominion Club at its headquarters on Lac Claire. Various kindly members have described the place and how to get there, but we have never narrowly inquired as to the means of access from St Azore to the camp. We only understood we were to be met and driven to the spot. With a glance of surprise at the state of the road before us, we climbed into our seats, expressing a hope that the end of our journey lay distant only a mile or so. When with one sudden jolt the horse started, in obedience to an ejaculation from the driver, we realised that the cart was constructed without springs. We criticised the road, which was very bad—one sea of mud and full of holes; but before the end of the journey we looked back to the first mile as having been easy and pleasant. Our first remark to the smiling driver was to ask him anxiously how many miles lay between us and the camp. His reply was unintelligible, and from his amusement we gathered that he understood nothing of what we said. Reflecting comfortably that our French was too good for him, we confined our remarks to increasingly severe comments on the road, which became

at every yard more impossible. The explanation really was simple: the road is a good one in winter, and winter here lasts for eight months of the year. This was May, and in May the frost begins to come out of the ground. It is a frost that has gone down solidly six or seven feet into the earth, and the breaking up results in mud unspeakable. Used only by the scattered farmers and labourers of this remote country, the road has never been properly made, nor is it any one's business to keep it in order. It is a road, and that is all that can be said. We implored the driver to forsake it and drive in the fields. Unconscious of our real agony of mind and body, he merely smiled his eternal smile, and we plunged on, watching the wheels sink every yard or two into holes from which extrication seemed unlikely. The horse was a miracle of cleverness; it waded out of deep holes and scrambled up and slid down abrupt little hills in a manner that was astonishing. The driver never used the whip at any crisis. He emitted a series of noises suited to each dilemma as it arose. When all went well it was a loud 'Hu-u-u!' but the sound became more intense and less loud with the gravity of the situation. When immediate catastrophe threatened, and the animal was immersed to the girths in mud and one wheel slowly sinking into a ditch, the noise was almost a coo, soft and persuasive: 'A-dah, a-dah, a-daah!' The sound, which to us seemed most inadequate, inspired the horse to fresh efforts, and disaster was averted. These anxieties continued for eleven miles. On and on we floundered, penetrating at last into a thick wood. Then the road ceased, and we lumbered perilously down a last rugged slope with a sigh of relief. 'This *must* be the place, for the road goes no farther.'

There was not a sign of any camp or human habitation. Before us spread the gray waters of a lake; all around were the silent woods. Below us by the shore were to be seen two flat-bottomed canoes and a little group of rowers, some of whom now came forward to carry our luggage from the cart, from which we descended with unspeakable thankfulness. It had rained the whole time, but this was such a minor discomfort that we hardly noticed our dripping condition. The driver, still smiling broadly, watched us embark, and we glided away over the lake very pleasantly, though the rain was still pitiless. Our companions were Habitants—French Canadian—though the lank black hair and high cheek-bones proclaimed their Indian blood. Our experiences in the cart had taught us the futility of asking how far we had yet to travel. We gave ourselves up to the pleasant gliding sensation of the canoe. It was early in May, and at the edges of the lake the last thin sheets of ice cracked and broke away at the touch of the paddles. On all sides of the gray lake rose the gray woods, broken here and there by a rocky headland or a red scaur. Nothing else could be seen, and for hundreds and hundreds of miles you might travel on and on and see nothing but the wastes of waters and the impenetrable woodland heights—hill and lake, hill and lake—far as man may wander into the great, still regions. As yet the closely growing trees showed no green; waiting the first burst of hot sunshine, they kept their wintry reserve, and shortly would rush suddenly into the fervid summer glory that would last so short a space. Meanwhile all is gray-brown, deep, silent, impenetrable.

Presently we rounded a headland, and our guides pointed out a group of log buildings by the waterside. Here the wood has been cleared away, and the Dominion Club has built its headquarters. Awaiting us on the landing-stage stood Mr B., the secretary. His most kindly welcome and the mighty fire burning on the stones of the log-home were alike comforting after the toils of the journey. As we grew warm and dry we took in our first pleasant impressions of the 'camp,' with its two spacious wooden rooms, the bare simplicity of proportion and furnishing giving a distinction most restful to the senses. Upstairs were a number of little bedrooms, and across a space of grass stood another log house, where meals were served. Scattered about were other smaller huts. It looked almost like a little village, simple, intimate, homely.

The Dominion Club has five hundred members, some Canadian, but for the most part New York men. They have fishing and shooting rights over half a million acres, and have raised here and there in the immense wilderness of woods and waters log houses to form shelters for the members while on their sporting expeditions. In spring the countless lakes and rivers afford excellent trout-fishing, and there are moose, caribou, bears, and partridges. The stir of camp-life goes on among the groups of huts, for here at headquarters are gathered together sometimes as many as a hundred guides—some French peasants, some half-breed Indians (the last survivors of the ancient Huron tribe). They know the trails through the woods, the channels of the rivers, the fishing-grounds of the lakes. They have the instincts of the wilderness and a lifetime of training. All the spring and summer months they gather here from scattered villages of Quebec, spending the days in attendance on the members of the club. Their work consists in carrying the light canoes on their heads through the trails of the forest; then when a lake is reached they launch the canoes and paddle across to where the next trail lies hidden in the entangled underwood of the shore. Sometimes the journey is continued for days, from hut to hut, and parties of sportsmen disappear under their guidance for a month at a time into the wild fastnesses of the woods. In the winter the guides return to their villages to work upon farms or as lumbermen. Descendants of the *voyageurs* of old—the *coureurs de bois* whose adventurous enterprises, lawless as they were, had their part in the making of Canada—instinct and training have combined in revealing to them the secrets of the forest immensities, the accessible *portages* through the tangled growth, the channel

through the rapids of the river. They know the woodland lore, and for the most part these foreign subjects of the King know nothing else. The great slumbrous tranquillity of the woods has entered into the blood of the race. They know neither discontent nor ambition.

Hither also come the trappers, men whose lives have been spent in intimacy with Nature among the solitudes, with a knowledge of the habits of animals which has long become instinctive. Long lonely months they pass on their rounds among the lakes and hills, laying and visiting traps for bear and the smaller fur-bearing animals such as beaver and mink. These trappers are a race apart, often with blood nearly purely Indian, and with all the Indian's wonderful instinct for hunting. Often these lonely lives end in a lonely death; the trapper disappears into the woods on an accustomed journey, and is never seen again.

Even as the people are alien with the strangeness of a race derived in the far past from wilder stock than our own, so the natural surroundings have an indefinable strangeness too. Lac Claire, with its heavy fringe of untouched forest, is as unknown in character as the cry of the loons whose black forms move across the distant waters. Now and again the drumming of the Canadian partridge—something like a large grouse—breaks upon the ear. No birds are singing; the solitudes are for the most part voiceless. Very soon everything is going to break into a vivid summer, but meanwhile there lacks the exhilaration of our own slow, exquisite spring awakening. In May the woods are still sad, the nests still unbuilt.

Yet we have chosen the time of our visit well, for before the end of May will begin the torment of mosquitoes, and a very little later the 'black flies' make their appearance and render the region insupportable. Club members are arriving daily—we see their loaded canoes rounding the point—to enjoy the few weeks of fishing between the breaking up of winter and the arrival of the black fly. For the most part these sportsmen remain only a night or two at headquarters; taking with them guides and canoes, they depart into the wilderness. But every night we are a party of eight or ten at dinner. Everything at table is of the simplest, but the cooking is good. It is all done by a staff of French peasants under the command of Josette the cook, who superintends the household work of the camp, and on whose goodwill depends our comfort. She is black-eyed, friendly, and sympathetic; it was a pleasure to see the triumph of her smile as she handed at dinner some dish which we should have thought quite beyond the resources of the camp. Everything about the place bore the stamp of cleanliness and efficiency, with a perfect simplicity that was a constant refreshment.

The first day chanced to be wet, and my husband fished in Lac Claire, getting one trout between five and six pounds in weight. This is by no means unusual, for trout are constantly caught weighing ten and twelve pounds, though we never saw one of these. With rods, guides, and canoes, we made daily excursions from trail to trail, from lake to lake, among surroundings so alluring in their wild liberty that the life of the woods laid hold of our imagination; and, as if we could claim the adventurous, stirring blood from long-dead *voyageurs*, we penetrated daily with growing enjoyment into the solitary places, gliding past the haunt of beaver and loon along the tideless creeks, landing to explore a tangled island, beating out a path in some unravelled undergrowth.

We spent more than one long day on the solitudes of a remote mere called Lac de Paille. It was reached by two *portages*—gradual ascents first from the camp to Lac Pierre, where the lumbermen were busy, and the water thick with floating logs, among which our canoe pushed very cleverly; and then by another, from a very wet landing on the other side, through the forest to a higher lake than any we had visited. The name of our guide was Bateese Leblanc, a typical specimen of the Habitant, whose quaint French-American dialect the poems of William Drummond have made familiar. He enjoyed short excursions from the canoe into the brushwood in search of a partridge's nest or to show us a bear-trap, and displayed curiosity and amazement when, on his asking us how far we had travelled to fish in this district, we replied, 'More than three thousand miles.' This staggered his imagination, and he made no further effort for some time, except to inquire my age, and look pained on receiving an evasive reply. He knew his way wonderfully, for he had not been to Lac de Paille for fifteen years; he said he doubted if any one had been there during that time, and when we mounted the last height of the *portage* and the mere came in sight, the statement seemed easy of belief.

The word *mere* expresses better than any other the aspect of the great sheet of still, gray water, surrounded by a morass of reeds. It was quite different to the other waters, for the woods were more distant from the shores, and we seemed to have risen into a larger, lighter atmosphere. The lake was rather a very slow, shallow river coming noiselessly down through a tangle of gray reeds and opening out here and there into wide, glimmering, shallow spaces. Across these spaces and by deeper channels we glided without sound save the gentle dip of the paddle and the flick of the line as my husband cast and cast again. The fishing was only a secondary interest; the thrill of the great isolation held us, the exquisite sense of loneliness where, wide and still, the mighty forests stretched away to those boundless horizons of the Great North Land, the only region left of earth's secret places. Now the morasses drew to narrower channels, the woods clustered nearer, and we saw at the end of the mere the inflow of a small river, dropping a few feet over stones, and forming a pool in the shadow of the trees, and here we ran the canoe in among

fallen logs and reeds. Standing on a stone just below the tiny fall, my husband threw a large white-and-scarlet fly, and with the first cast hooked a fine trout, with the next cast another. They literally fought for the fly, and for the space of half-an-hour he continued to land fish weighing between one pound and three pounds, to the number of eighteen. We then decided to give them a rest, and paddled away to other places, lunched, and then returned to the pool again and fished, successfully landing ten more trout.

Late in the afternoon we had to set forth on the return journey, and as the canoe glided noiselessly from the shadow of the forests where they closed in about the river, out into the wide spaces and narrow channels, there broke upon the silence a strange, harsh cry. The voice of the bird known as the stake-driver is hard to describe; it is necessary to hear it in order to realise that the note of any feathered creature could be so discordant. It is like the bray of a donkey—quite as loud and sustained—prefaced by a series of heaving groans. The effect of this sound breaking upon the silence of the desert places is indescribable. It is generally not far off, for the stake-driver gives forth these notes in order to scare intruders from the region of its mate's nest; though nothing, one would judge, could be better calculated to draw attention to the spot. Notwithstanding the fact that the noise continued for some time, and near as it must have been, we never saw the bird. Bateese professed to have seen one, and said it was a gray bird with long legs, as large as a hen. While we listened another sound broke across the water, this time a wet sound of suction at short intervals, which Bateese could neither recognise nor explain. The canoe was now gliding between banks of reeds and bog where the lake narrowed to a stretch of shallow channel. Suddenly an agitated whisper broke from Bateese, 'Look at dose great beeg moose.' With a wonderful thrill of excitement we saw, standing in the morass at the edge of the water, two huge bull moose. They had come to drink, and the sound we had heard was caused by their feet plunging in and out of the bog as they crossed from the forest to the lake. They were distant from us only about fifty yards. With lifted heads they remained perfectly motionless, staring at the sight of what was probably their first view of human beings. Immovably they gazed, to the obvious disquiet of Bateese, whose experience of moose led him to expect them to run away. 'Is de lady afraid?' he said, a remark which amused us at the time, though afterwards we were told that moose will sometimes pursue and attack out of curiosity. That we were in very shallow water was a fact known only to Bateese, who thus understood our unenviable position in the event of the huge animals taking to the water in pursuit. Our only anxiety was to adjust the camera with as little movement as possible to secure so desirable a snapshot. So the canoe drew nearer and then glided past the watching moose, and only then did they slowly turn from the water and make their way back into the forest, trotting deliberately up the slopes, where the great brown forms were soon lost to sight among the trees.

To return to camp with such an experience to relate and such a haul of trout to show was a triumph. We had seen mink besides, had examined a beautifully constructed beaver-house and woodpecker's nest, and a curious swimming furry animal three feet long from nose to tail, which I alone had seen, and described so badly that its species could never be decided. The expedition had been full of sensations, and we could not resist going back to Lac de Paille another day. Standing on the same stone in the same pool, we got ten more large trout, but never saw anything after the first hour, so concluded that we had emptied the place of fish for the time. Again we heard the hideous cry of the stake-driver, but saw no more wild animals. On that afternoon the mosquitoes came out, and we broke camp next day.

Very regretful were our good-byes to the little group of friends—Mr B., whose warm, genial friendliness is one of our brightest memories; the various members of the club, who had done all that was possible with kindly welcome and interest to add to our enjoyment; Josette, who came out of her kitchen to allow herself to be photographed for the first time in her life; and Bateese, who was full of gentle melancholy at our departure, as he paddled us away from the camp across the lake to the landing where our conveyance awaited us.

We reached St Azore by the same road as we came. Its condition was worse, because the frost was still further broken.

Lac Claire lies more than three thousand miles away. As I write these lines, remembering the strange charm of the region, it rises in the mind as a dream-land of a dream-life. With thoughts of the far solitudes we have seen come thoughts of the regions farther still—the boundless wastes we shall never see, upon which, for generations to come, no voice will ever break, no foot ever fall. Yet these profound solitudes have a voice of their own, these immensities are calling to us to-day. In this wild continent lies the far future of Britain, the land of her promise and of her utmost inheritance. For this is Canada, and the voice is of the greatest land calling to the greatest people. Out of the shadowy legends of her past she must at last emerge into the development that shall raise her to be a power in the world's history. Her wilderness awaits the splendid conquests of peace.

Should any reader of these lines chance to find himself among the mountains of Quebec, in the land of forest, stream, and lake, let him remember in equipping himself that the white-and-scarlet fly that proved so deadly with the trout in Lac de Paille is called the 'Parmacini Belle.'

PAUTÖE.

By Louis Becke.

'PLEASE, good white man, wilt have me for *tavini* [servant]?'

Marsh the trader, and the Reverend Harry Copley, the resident missionary on Motumoe, first looked at the speaker, then at each other, and then laughed hilariously.

A native girl, about thirteen years of age, was standing in the trader's doorway, clad only in a girdle of many-hued dracæna-leaves. Her long, glossy black hair fell about her smooth, red-brown shoulders like a mantle, and her big, deer-like eyes were filled with an eager expectancy.

'Come hither, Pautöe,' said the missionary, speaking to the girl in the bastard Samoan dialect of the island. 'And so thou dost want to become servant to Marsi?'

Pautöe's eyes sparkled. 'Ay,' she replied. 'I would be second *tavini* to him. No payment do I want; only let him give me my food and a mat upon which to sleep, and I shall do much work for him—truly, much work.'

The missionary drew her to him and patted her shoulder.

'Dost like sardines, Pautöe?'

She clasped her hands over her bosom and looked at him demurely from underneath her beautiful long-lashed eyes, and then her red lips parted and she showed her even, pearly teeth as she smiled.

'Give her a tin of sardines and a biscuit or two, Marsh,' said the parson. 'She's one of my pupils at the Mission House. You remember Bret Harte's story, *The Right Eye of the Spanish Commander*, and the little Indian maid Paquita? Well, this youngster is *my* Paquita. She's a most intelligent girl.' He paused a moment, and then added regretfully, 'Unfortunately my wife dislikes her intensely—thinks she's too forward. As a matter of fact, a more lovable child never breathed.'

Marsh nodded. He was not surprised at Mrs Copley disliking the child, for she—a thin, sharp-visaged, and austere lady of forty years of age—was childless, and older than her cheerful, kind-hearted husband by twelve years.

'I wish you would take the child, Marsh,' said the missionary presently. 'She is an orphan, and'——

'I'll take her, of course. She can help Leota, I dare say, and I'll give her a few dollars a month. But why isn't she dressed in the usual flaming style of your other pupils: skirt, blouse, brown-paper-soled boots, and a sixpenny poke bonnet with artificial flowers, and otherwise made as one of the "brands plucked from the burning" whose photographs glorify the parish magazines in the old country?'

Copley's blue-gray eyes twinkled. 'Ah, that's the rub with my wife. Pautöe won't "put 'em on." She is not a native of this island, as you can no doubt see. Look at her now: almost straight nose, but Semitic, thin nostrils, long silky hair, small hands and feet. Where do you think she hails from?'

'Somewhere to the eastward—Marquesas Group, perhaps.'

'That is my idea too. Do you know her story?'

'No. Who is she?'

'Ah, that no one knows. Early one morning twelve or thirteen years ago—long before I came here—the natives saw a small topsail schooner becalmed off the island. Several canoes put off, and the people as they drew near the vessel were surprised and alarmed to see a number of armed men on deck, one of whom hailed them, and told them not to come on board, but that one canoe only might come alongside. But the natives hesitated till the man stooped down and then held up a baby-girl about a year old, and said, "If you will take this child on shore and care for it I will give you a case of tobacco, a bag of bullets, two muskets, and a keg of powder, some knives, axes, and a two-fifty-pound tin of ship-biscuit. The child's mother is dead, and there is no woman on board to care for it." For humanity's sake alone the natives would have taken the infant, and said so; but at the same time they did not refuse the offer of the presents. So one of the canoes went alongside, the babe was passed down, and then the presents. Then the people were told to shove off. A few hours later a breeze sprang up, and the schooner stood away to the westward. That was how the youngster came here.'

'I wonder what had occurred.'

'A tragedy of some sort—piracy and murder, most likely. One of the natives, named Rahili, who went out to the vessel, was an ex-sailor who spoke and could also read and write English well, and he noticed that although the schooner was much weather-worn, as if she had been a long while at sea, there was a newly painted name on her stern—*Meta*. That in itself was suspicious. I sent an account of the affair to the colonial papers, but nothing was known of any vessel named the *Meta*. Since then the child has lived first with one native family and then another. As I have said, she is extremely intelligent, but has a curiously independent spirit—"refractory," my wife calls it—and does not associate with the other native girls. One day not long ago she got into serious trouble through her temper getting the better of her. Lisa, my native assistant's daughter, is, as I dare say you know, a very conceited, domineering young lady, and puts on very grand airs—all these native teachers and their wives and daughters are alike with regard to the

"side" they put on—and my wife has made so much of her that the girl has become a perfect female prig. Well, it seems that Pautöe refused to attend my wife's sewing-class (which Lisa bosses), saying that she was going out on the reef to get crayfish. Thereupon Lisa called her a *la'akau tafea* (a log of wood that had drifted on shore), and Pautöe, resenting the insult and the jeers and laughter of the other children, seized Mademoiselle Lisa by the hair, tore her blouse off, and called her a "fat-faced, pig-eyed monster."'

Marsh laughed. 'Description terse, but correct.'

'The deacons expelled her from school and ordered her a whipping; but the chief and I interfered, and stopped it.'

The trader nodded approval. 'Of course you did, Copley—just what any one who knows you would expect you to do. But although I am quite willing to give the child a home, I can't be a schoolmaster to her.'

'Of course not. You are doing more than any other man would do for her.'

. . . . . .

Twelve months had passed, and Marsh had never had reason to regret his kindness to the orphan. To him she was wonderfully gentle and obedient, and from the very first had acceded to his wish to dress herself in semi-European fashion. The trader's household consisted of himself and his two servants, a Samoan man named Āli (Harry) and his wife Leota. For eight years they had followed his fortunes as a trader in the South Seas, and both were intensely devoted to him. A childless couple, Marsh at first had feared that they would resent the intrusion of Pautöe into his home. But he was mistaken; for both Āli and Leota had but one motive for existence, and that was to please him—the now grown man, who eleven years before, when he was a mere youth, had run away from his ship in Samoa, and they had hidden him from pursuit. And then, when Tikki (Dick) Marsh, by his industrious habits, was enabled to begin life as a trader, they had come with him, sharing his good and his bad luck with him, and serving him loyally and devotedly in his wanderings throughout the isles of the Pacific. So when Pautöe came they took her to themselves as a matter of duty; then, as they began to know the girl, and saw the intense admiration she had for Marsh, they loved her, and she entered deep into their warm hearts. And Pautöe would sometimes tell them that she knew not whom she loved most—Tikki or themselves.

Matters, from a business point of view, had not for two years prospered with Marsh on Motumoe. Successive seasons of drought had destroyed the coco-nut crop, and so one day he told Copley, who keenly sympathised with him, that he must leave the island. This was a twelvemonth after Pautöe had come.

'I shall miss you very much, Marsh,' said the missionary—'miss you more than you can imagine. My monthly visits to you here have been a great solace and pleasure to me. I have often wished that, instead of being thirty miles apart, we were but two or three, so that I could have come and seen you every few days.' Then he added, 'Poor little Pautöe will break her heart over your going away.'

'But I have no intention of leaving her behind, Copley. I am not so hard pressed that I cannot keep the youngster. I am thinking of putting her to school in Samoa for a few years.'

'That is very generous of you, Marsh. I would have much liked to take her into my own house; but—my wife, you know.'

Two weeks later Marsh left the island in an American whaleship which was to touch at Samoa. There he intended to buy a small cutter, and then proceed to the Western Pacific, where he hoped to better his fortunes by trading throughout the various islands of the wild New Hebrides and Solomon Groups.

During the voyage to Samoa he one day asked Pautöe if she would not like to go to school in Samoa with white and half-caste girls, some of her own age and others older.

Such an extraordinary change came over the poor child's face that Marsh was astounded. For some seconds she did not speak, but breathed quickly and spasmodically as if she were physically exhausted; then her whole frame trembled violently. Then a sob broke from her.

'Be not angry with me, Tikki; but I would rather die than stay in Samoa—away from thee and Āli and Leota. Oh master!' She ceased speaking and sobbed so unrestrainedly that Marsh was moved. He waited till she had somewhat calmed herself, and then said gravely:

''Twill be a great thing for thee, Pautöe, this school. Thou wilt be taught much that is good, and the English lady who has the school will be kind'——

'Nay, nay, Tikki,' she cried brokenly, 'send me not away, I beseech thee. Let me go with thee and Āli and Leota to those new, wild lands. Oh, cast me not away from thee! Where thou goest let me go.'

Marsh smiled. 'Thou art another Ruth, little one. In such words did Ruth speak to Naomi when she went to another country. Dost know the story?'

'Ay, I know the story, and *I* have no fear of wild lands. Only have I fear of seeing no more all those I love if thou dost leave me to die in Samoa.'

Again the trader smiled as he bade her dry her tears.

'Thou shalt come with us, little one. Now, go tell Leota.'

For many months Marsh remained in Apia, unable to find a suitable vessel. Then, not caring to remain in such a 'rackety' and expensive port, he rented a native house at a charmingly situated

village called Laulii, about ten miles from Apia, and standing at the head of a tiny bay almost land-locked by verdant hills. So much was he pleased with the place that he half-formed a resolution to settle there permanently, or at least for a year or two. Āli and Leota were delighted to learn this, for although they were willing to go anywhere in the world with their beloved Tikki, they, like all Samoans, were passionately fond of their own beautiful land, with its lofty mountains and forests and clear-running streams.

And Pautöe, too, was intensely happy, for to her Samoa was a dream-land of light and beauty.

Quite near to Laulii was another village, Lautonga, in which there lived a young American trader named Lester Meredith, an ex-sailor. He was an extremely reserved, quiet man, but he and Marsh soon became friends, and they exchanged almost daily visits. Meredith, like Marsh, was an unmarried man, and one day the local chief of the district jocularly reproached them.

'Thou, Tikki, art near to twoscore years, and yet hast no wife; and thou, Lesta, art one score and five, and yet live alone. Why is it so? Ye are both fine, handsome men, and pleasing to the eyes of women.'

Marsh laughed. 'Oh Tofia, thou would-be matchmaker, I am no marrying man. Once, indeed, I gave my heart to a woman in mine own country of England; but, although she loved me, her people were both rich and proud, and I was poor. So she became wife to another man.'

Pautöe, who was listening intently to the men's talk, set her white teeth and clenched her shapely little hands, and then said slowly, 'Didst kill the other man, Tikki?'

Marsh and Meredith both laughed, and the former shook his head. And then Tofia turned to Meredith.

'Lesta, hast never thought of Maliea, the daughter of Tonu? There is no handsomer girl in Samoa, and she is of good family. And she would like to marry thee.'

Meredith smiled, and then said jestingly, 'Nay, Tofia, I care not for Maliea. I shall wait for Pautöe.—Wilt have me, little one?'

The girl looked at him steadily, and then answered gravely, 'Ay, if Tikki is willing that I should. But yet I will not be separated from him.'

'Then you and I will have to become partners, Meredith,' said Marsh, his eyes twinkling with amusement.

. . . . . .

A few days after this Meredith returned from a visit to Apia.

'Marsh,' he said to his friend, 'I think it would be a good thing for us both if we really did go into partnership, and put our little capital together. Are you so disposed?'

'Quite. There is nothing I should like better.'

'Good! Well, now I have some news. I have just been looking at a little schooner in Apia harbour. She arrived a few days ago, leaking, and the owner will sell her for eighteen hundred dollars. She will suit us very well. I overhauled her, and except that she is old and leaks badly from having been ashore, she is well worth the money. You and I can easily put her on the beach here, get at the leak, and recopper her at a cost of a few hundred dollars. We can have her ready for sea in three weeks. You, Āli, and myself can do all the work ourselves.'

Marsh was delighted, and in less than an hour the two men, accompanied by Āli and Tofia, were on the way to Apia, much to the wonder of Leota and Pautöe, who were not then let into the secret—the newly-made partners intending to give them a pleasant surprise.

On boarding the little craft Marsh was much pleased with her; and during the day the business of transferring the vessel to her new owners was completed at the American Consulate, the money paid over, and the partners put in possession.

The same evening Āli, a splendid diver, succeeded in finding and partly stopping the main leak, which was on the bilge on the port side, and preparations were made to sail early in the morning for Laulii.

The partners were seated in the little cabin, smoking and talking over their plans for the future, when the former master and owner of the schooner came on board to see, as he said, 'how they were getting on.' He was a good-natured, intelligent old man, and had had a lifelong experience in the South Seas. By birth he was a Genoese; but he was intensely proud of being a naturalised British subject and from his youth having sailed under the red ensign of Old England. Marsh and Meredith made him very welcome, and he, being mightily pleased at having sold the *Dove* (as the schooner was called) and also having dined exceedingly well at the one hotel then in Apia, became very talkative.

'I can tell you, gentlemen, that the *Dove*, although she is not a new ship, is as strong and sound as if she were only just built. I have had her now for nearly thirteen years, and have made my little fortune by her, and I could kiss her from the end of her jib-boom to the upper rudder gudgeon. But I am an old man now, and want to go back to my own country to die among my people; or else'—and here he twisted his long moustaches and laughed hilariously—'settle down in England, and become a grand man like old General Rosas of South America, and die pious, and have a bishop and a brass band at my funeral.'

The partners joined the old sailor in his laugh. And then Marsh said casually, and to make conversation, 'By the way, captain, where did you buy the *Dove*?'

'I didn't buy her, my bold, breezy lads. And I didn't steal her, as many a ship is stolen in the South Seas. I came by her honestly enough.'

'A present?' said Meredith interrogatively.

'Wrong, my lad—neither was she a present.' Then the ancient squared his broad shoulders, helped

himself to some refreshment (more than was needed for his good), and, clapping Marsh on the shoulder, said, 'I 'll tell you the yarn, my lads, for you are only lads compared with me, aren't you? Well, here it is. About twelve or thirteen years ago I was mate of a San Francisco trading-brig, the *Lola Montez*, and one afternoon, when we were running down the east coast of New Caledonia, we sighted a vessel drifting inshore—this very same schooner. The skipper of the brig sent me with a boat's crew to take possession of her—for we could see that no one was on board. I boarded her and found that her decks had been swept by a heavy sea, which, I suppose, had carried away every one on board. I overhauled the cabin, but could not find her papers, but her name was on the stern—*Meta*.'

Marsh started and was about to speak, but the old skipper went on.

'During the night heavy weather came on, and the *Lola Montez* and the *Meta* parted company. The *Lola* was never heard of again; she was old and as rotten as an over-ripe pear, and I suppose her seams opened and she went down. So I stuck to the *Meta*, brought her to Sydney, and renamed her the *Dove*. And she 's a bully little ship, I can tell you. I think that she was built in the Marquesas Islands, for all her knees and stringers are of *ngiia*-wood (lignum-vitæ) cut in the Marquesan fashion, and set so closely together that any one would think she was meant for a Greenland whaler. Then there is another thing about her that you will notice, which makes me feel sure that she was built by a whaleman, and that is the carvings of whales on each end of the windlass barrel, and on every deck stanchion there are the same, although you can hardly see them now, they are so much covered up by yearly coatings of paint for over a dozen years.'

Meredith rose suddenly from his seat.

'You 'll excuse me, but I feel tired, and must turn in.'

The visitor took the hint, and did not stay. Wishing the partners good luck, he got into his boat and pushed off for the shore.

Then Meredith turned to Marsh, and said quietly, 'Marsh, I know that you can trust Āli; but what of Tofia?'

'He 's all right, I think. But what is the matter?'

'I 'll let you know presently. But first tell Tofia that he had better go on shore to sleep. You and I are going to have a quiet talk, and then do a little overhauling of this cabin.'

Wondering what possibly was afoot, Marsh got rid of the friendly chief by asking him to go on shore and buy some fresh provisions, but not to trouble about bringing them off until daylight, as he and his partner were tired and wanted to turn in.

Leaving Āli on deck to keep watch, the two men went below and sat down at the cabin table.

'Marsh,' began the young American, 'I have a mighty queer yarn to tell you. I know that this schooner, once the *Meta* and now the *Dove*, was originally the *Juliette*, and was built by my father at Nukahiva in the Marquesas. Now, I 'll get through the story as quickly as possible; but as I don't want to be interrupted, I 'll ask Āli not to let any chance visitor come aboard to-night.'

He went on deck, and on returning first filled and lit his pipe in his cool, leisurely manner, and resumed his story.

'My father, as I one day told you, was a whaling skipper, and was lost at sea about thirteen years ago; that is all I ever did say about him, I think. He was a hard old man, and there was no love between us, so that is why I have not spoken of him. He used me very roughly, and when my mother died I left him, after a stormy scene. That was eighteen or nineteen years ago, and I never saw him again.

'When my poor mother died he sold his ship and went to the Marquesas Islands, and opened a business there as a trader. He had made a lot of money at sperm-whaling, and, I suppose, thought that as I had left him, swearing I never wished to see him again, he would spend the rest of his days in the South Seas, money-grubbing to the last.

'Sometimes I heard of him as being very prosperous. Once, when I was told that he had been badly hurt by a gun accident, I wrote to him and asked if he would care for me to come and stay with him. This I did for the sake of my dead mother. Nearly a year and a half passed before I got an answer—an answer that cut me to the quick: "I want no undutiful son near me. I do well by myself."

'Several years went by; and then, when I was trading in the Fijis, I was handed a letter by the American consul. It was two years old, and was from my father—a long, long letter written in such a kindly manner and with such affectionate expressions that I forgave the old man all the savage and unmerited thrashings he had given me when I sailed with him as a lad.

'In this letter he told me that he wanted to see me again—that made me feel good—and that he had built a schooner, which he had named *Juliette* after my mother, who was a French Canadienne. He described the labour and trouble he had taken over her, the knees and stringers of *ngiia*-wood, and the carvings of sperm-whales he had had cut on the windlass butts and stanchions. Then he went on to say that he had been having a lot of trouble with the French naval and civil authorities, who wanted to drive all Englishmen and Americans out, and had made up his mind to leave the Marquesas and settle down again either in Samoa or Tonga, where he hoped I would join him and forget how hardly he had used me in the past.

'The gun accident, he wrote, had rendered him all but blind, and he had engaged a man named Krause, a German, as mate, and to navigate the *Juliette* to Tonga or Samoa. Krause, he said, was a man he did not like or trust; but, as he was a

good sailor-man and could navigate, he had engaged him, as he could get no one else at Nukahiva.

'With my father were a party of Marquesan natives—a chief and his wife and her infant, and two young men. The schooner's crew were four Dagoes—deserters from some ship. He did not care about taking them, but had no choice.

'Some ten days before the German and the crew came on board, my father secretly took all his money—eight thousand dollars in gold—and, aided by the Marquesan chief, made a secure hiding-place for it by removing the skin in the transoms, and then packing it in oakum and wedging each package in between the timbers. Then he carefully relaid the skin and repainted the whole. He said, "If anything happens to me through treachery, no one will ever discover that money, although they will get a couple of thousand of Mexican silver dollars in my chest."

'Well, the *Juliette* sailed, and was never again heard of. That brings my story to an end, and if this is the *Juliette*, and the money has not been taken, it is within six feet of us—there;' and he pointed calmly to the transoms.

Marsh was greatly excited.

'We shall soon see, Meredith. But first let me say that I am sure that this *is* your father's missing schooner, and that she is the vessel that thirteen years ago called at Motumoe, and those who sailed her sent Pautöe on shore when she was an infant.'

Then he hurriedly related the story as told to him by Mr Copley.

Meredith nodded. 'No doubt the missionary was right, and my father's fears were well founded. I suppose the German and the Dagoes murdered him and the four Marquesans. Krause, of course, would know that my poor father had money on board. And I dare say that the Dagoes spared the child out of piety—their Holy Roman consciences wouldn't let 'em cut the throat of a probably unbaptised child. Now, Marsh, if you'll clear away the cushions and all the other gear from the transoms, I'll get an auger and an axe, and we'll investigate.'

Rising from his seat in his usual leisurely manner, he went on deck, and returned in a few minutes with a couple of augers, an axe, and two wedges. Marsh had cleared away the cushions and some boxes of provisions, and was eagerly awaiting him.

Meredith first of all took the axe, and with the back of the head struck the casing of the transoms.

'It's all right, Marsh. Either the money or something else is there right enough, I believe. Bore away on your side.'

The two augers were quickly biting away through the hard wood of the casing, and in less than two minutes Marsh felt the point of his break through the inner skin, and then enter something soft; then it clogged, and finally stuck. Reversing the auger, he withdrew it, and saw that on the end were some threads of oakum and canvas, which he excitedly showed to his partner, who nodded, and went on boring in an unmoved manner until the point of his auger penetrated the planking, stuck, and then came a sound of it striking loose metal. The wedges were then driven in between the planking, and one strip prised off, and there before them was the money in small canvas bags, each bag parcelled round with oakum, which was also packed tightly between the skin and timbers, forming a compact mass.

Removing one bag only, Marsh put it aside; then they replaced the plank, plugged the auger-holes, and hid the marks from view by stacking the provision-cases along the transoms.

Ali was called below and told of the discovery. He, of course, was highly delighted, and his eyes gleamed when Meredith unfastened the bag and poured out a stream of gold coin upon the cabin table.

That night the partners did not sleep. They talked over their plans for the future, and decided to take the schooner to San Francisco, sell her, and buy a larger vessel and a cargo of trade-goods. Meredith was to command, and Tahiti, in the Society Group, was to be their headquarters. Here Marsh (with the faithful Ali and Leota, and of course Pautöe) was to buy land and form a trading station, whilst the vessel was to cruise throughout the South Seas, trading for oil, pearl-shell, and other island produce.

Soon after daylight the anchor of the *Juliette* was lifted and she sailed out of Apia harbour, and by noon Leota and Pautöe were astonished to see the little craft bring-to abreast of Laulii village, and Marsh and Meredith come on shore.

Later on in the day, when the house was free of the kindly but somewhat intrusive native visitors, the partners told the strange story of the *Juliette* to Leota and Pautöe, and related their plans for the future.

. . . . . .

'Pautöe,' said Meredith, 'in three years' time will you marry me, and sail with me in the new ship?'

'Ay, that will I, Lesta. Did I not say so before?'

CONSOLS AND RENTES.

IT is the glorious privilege of most countries to possess a National Debt, and in the case of the leading nations the amounts are very large. If we include the capital represented by the railways, Germany heads the list; but, excluding these, France leads the way with £1,000,000,000; Russia probably comes next, though the exact amount is not known; the third place falls to Germany, if the Empire Debt and those of Prussia and the other states be grouped together, the total being £836,240,000, exclusive of railways; and the fourth place falls to the United Kingdom with £750,000,000.

The present article is concerned only with the United Kingdom and France, and the term Consols will be used for the National Debt of the former and Rentes for the latter.

Giving our own country first place, the National Debt consists at present of about £615,000,000 of 2½ per cent. stock and £135,000,000 of practically 2¾ per cent. stock, registered in the names of the proprietors in the books kept at the head-offices of the two Banks of England and Ireland, which act as the agents of the Government.

Comparatively few persons have much personal experience with Consols. The work is transacted very much by the stockbrokers of London and Dublin, and the experience of those who have attempted to do their own work is not altogether encouraging. Speaking generally, the procedure is such as to present very serious obstacles to those of the humbler classes who have not solicitors and stockbrokers at their command. Further reference will be made to this later on.

The French Government has never utilised the Bank of France as its agent, but deals direct with its debt. The whole £1,000,000,000 bears interest at 3 per cent., and is represented partly by stock registered in the name of the owner in the Treasury Register (*Grand Livre*) and partly by bonds of varying amounts, with coupons for interest attached.

Another remarkable difference between Consols and Rentes is that Consols are held by only about two hundred thousand persons or institutions, thus giving an average holding of £3750 each. It is believed that Rentes are held by at least two millions, showing an average of £500, and in very many cases the holders are of a class who would never dream of investing in Consols. Finally, Consols fluctuate very much in value, a terrible disadvantage in an investment; they varied nearly 7 per cent. last year, while the French only varied 2½ per cent., and stood exactly at the same height at the end of the year as at the beginning. This is in accordance with the well-known financial law that stock which is widely held is far less prone to sudden fluctuations than when held by a few holders in large 'blocks.'

It may be interesting to give some particulars of the procedure of the two countries. The British system consists, as already mentioned, in entrusting not only the custody of the register of stockholders but all operations connected with Consols to the two head-offices of the Banks of England and Ireland. Sales, purchases, and dividends are all managed at these two centres, and if a man cannot attend in person he must find some one in the capital to act as his attorney in signing the books in his name. The deed appointing the attorney must be prepared by the Bank, and the precautions to be taken in executing it make the whole procedure burdensome and perplexing to the last degree to the humbler classes. Up till recently an owner had to attend at the Bank to get his dividends unless he gave an order to send them by post—a pleasant thing for a farmer in Sutherland to contemplate! The Bank of England has made a change in this respect, but not the Bank of Ireland. The great public companies of the United Kingdom have all abandoned this system of procedure by power of attorney. They do not require their shareholders to sign the register, as the Banks do, and they issue to the holders of their stock or shares a certificate, under their seals, showing how much stock is held by the owner; and if they receive by post an ordinary transfer correctly executed and the old certificate they cancel the latter and issue a fresh one in the name of the new owner, while all dividends are sent through the post by crossed cheques. There is a special Act of Parliament to deal with forged transfers, but this is not needed here. The change is as great as that between the old system of booking seats for a stage-coach early in the last century and the modern one of taking a railway ticket.

The effect of the difficulties in regard to Consols as compared with the system of the great companies just described has decidedly militated against the popularity of Consols. The poor man in humble circumstances, living far from London or Dublin, has no one to whom he can give a power of attorney, even if he mastered the formalities for its execution; his investments are, therefore, confined to the stocks he can buy and sell on the spot. It is true that there are stockbrokers in the larger towns; but it is also notorious that, as they cannot deal with Consols except through their London or Dublin agents, they do not recommend them.

A further difficulty is found in the fact that the Banks do not give a certificate. The purchaser has nothing to show, and if he die suddenly there is no document to tell his executors what has become of his savings. The Bank will eventually appropriate the dividends and stock to the Dormant Funds Account.

Noting the difficulty of the procedure as regards Consols as compared with ordinary investments,

many people have advocated the sweeping away of the whole system and the cordial adoption of the modern one as perfected by the companies.

So far so good; but there is another very important difference. The French utilise bonds, while the British do not. These bonds need some description. The French public debt is divided into two great divisions: Redeemable and Irredeemable Stock; and each of these is subdivided into stock and bonds. The Redeemable Stock is represented partly by stock registered in the Treasury in the names of the proprietors, as in England, and partly by bonds payable to bearer, passing by delivery from hand to hand, and provided with coupons for the interest. The Irredeemable Stock, in addition to both these, has also what are termed 'Mixed Bonds' (*Titres Mixtes*), which are bonds not transferable by delivery but by registration, though furnished with coupons for dividend purposes. The French issue formal certificates for stock to the holders, and the certificates are produced when the dividends are paid, and the payment is noted on the back of the bond.

This system appears clumsy, and when the French procedure is examined historically it is found that originally their system was in many respects the same as the British; but so early as 1831 a new procedure was started in the shape of bonds of various face-values for the principal of the debt, with coupons attached to them for the interest, which were cut off and cashed as they accrued due. These bonds, which passed by delivery from hand to hand without intermediary, and which have since been widely imitated by other countries, proved to be highly popular among people of small means. The smallest value was originally 50 francs (£2), but they have been gradually reduced till the minimum of 2 francs was reached in 1882. In the opinion of very many of the most competent authorities it is this popularity and simplicity of system, and not any inherent tendency to thrift of the French people, which has led the nation to become inveterate holders of Rentes; so that, while Consols are held by the classes, Rentes are in the possession of the masses.

A striking instance of the popularity of the Government Funds or Rentes occurred in 1871, when the French Government found themselves called upon to find £200,000,000 for the German war indemnity. The loan was subscribed several times over, and the gigantic sum was raised among the peasantry, the small traders, the farmers, the shopkeepers, by the mass of the country. The wealthy did not fail to come forward gallantly; but it was the support of the humbler classes which made the operation a success, and extorted the involuntary admiration of Prince Bismarck.

The following are the denominations of the bonds payable to bearer: Perpetual or Irredeemable Stock: 2f., 3f., 4f., 5f., 6f., 7f., 8f., 9f., 10f., 20f., 30f., 50f., 100f., 200f., 300f., 500f., 1000f., 1500f., and 3000f. The 'Mixed Bonds' are issued in similar amounts. Redeemable Stock: 15f., 30f., 60f., 150f., 300f., 600f., 1500f., and 3000f.

The fact that the tendency has been to issue bonds of lower and lower denomination shows that there is a demand for these small bonds, and in connection with this it is worthy of remark that of recent years the British public has grown very partial to companies whose shares are only £1 each.

It is believed by many that the explanation is that comparatively few people have £10 at their command—that is, ready to be invested without damaging their working capital—but they often have sums of £1 or £2; and this is just the sort of investor who likes a bond which he can keep. In his secret soul he has far more confidence in the security of his own old chest than in all the vaults, safes, and strong-rooms of the Banks of England and Ireland united.

Of late the British Government has had much difficulty in connection with Consols, which have fallen greatly in value, and which must be issued for carrying out the policy of the Irish Land Purchase Acts. It will be curious if this crisis leads the Government to discover that the present system of Consols is archaic, and ends in the cordial adoption of the certificate system of the limited liability companies, together with the issue of 'Bearer' and 'Registered' or 'Mixed Bonds,' with coupons for payment of the interest.

THE TOMB-HUNTERS OF EGYPT.

By Day Allen Willey.

N the valley of the Nile men are engaged in one of the strangest occupations which human beings pursue: hunting for tombs of the past. The discovery of human bodies which have been preserved in the form of mummies has been frequent in Egypt, and we know of many ancient kings and other personages that have been found in various places; but in almost every case the modern discoverers have learned that some one has been there before them—robbers who centuries ago entered the resting-places of the dead for the purpose of stealing the jewellery, vases, urns, and other valuables which had been left with the bodies by friends and relatives.

The great object of the tomb-hunters is to find a burial-place which has not been plundered, for they believe that it will not only contain great riches in gold and precious stones, but that the funeral

ornaments, as they are termed, will be of much value in throwing more light on the civilisation which here existed thousands of years ago. This is why the excavators include Americans and Europeans so interested that they are really devoting their lives to this search beneath the world, some of them employing labourers at their own expense to make the explorations. In the region about Thebes many archæologists are thus searching into its past history. For ten years and over some of them have not been out of Egypt, seldom leaving the desert plains and valleys which form the scene of their operations except for an occasional visit to Cairo to study the books and documents on the older Egypt which are in its library.

The little colony of explorers do not give their work a very dignified title. They speak of the different excavations as 'digs.' So the tourist who chances up the great river in one of the puffing steamboats or in that ideal sailing-yacht of the Nile, the dahabeeah, will be told of the German 'dig' carried on under the supervision of eminent savants from Germany; he may hear of the American 'dig,' a great hole in the sand and rock made with the money spent by a wealthy American who hopes some day to find a tomb with its treasure-hoard intact. Not far from this is an Anglo-American 'dig,' where a little band of British and American scientists have been excavating by means of money provided by the Egyptian Exploration Fund of London.

Yes, it is a fascinating occupation, this attempt to reveal the mysteries of what was once the heart of the world's civilisation, but is now a region of desolation where dwell only the fellah and Berber. No one knows when the tools will expose a structure erected perhaps thousands of years ago, which will be entered by man for the first time since its royal occupants were adorned with jewels, wrapped in literal cloth of gold, and left for ever in their chamber furnished and ornamented with things of wood and metal priceless because of their exquisite workmanship and their rare material.

That the ancient monarchs were thus honoured by their families has been shown by a discovery recently made in this region. True, another had already broken into the tomb before the scientists who found it; but so much of its furniture and ornaments had been left behind that an idea could be gained of the marvellous riches it had originally housed. The tale of those who last entered the tomb as related by them is well worth the telling:

'We went down the lower steps on through the rock-hewn descending corridor. It was barren. No works of funeral art strewed the floor; and the walls, unlike those of other tombs, were bare of both carving and painting. At the end of the corridor, where the second staircase was flanked by shelves, a mere bundle of dried onions lay on the rock. But on one of the steps a roll of papyrus met our eyes. Just beyond it we found a wall plastered with mud and sealed with the priestly seal. This alone separated us from the tomb itself; and the top was so broken that we could peer over into what for centuries on centuries no eye had seen: a confusion of dark forms shimmering mysteriously here and there with a touch of gold or of silver.

'Squeezing our way between the wall and the rock-ceiling, we were in the midst of such a medley of tomb-furniture that, in the glare of our lighted candles, the first effect was one of bewilderment. Gradually, however, one object after another detached itself from the shimmering mass, shining through the cool air, dust-free and golden. Against the wall to the left stood a chair, and beyond it a gilded coffin-cover lay upside-down. In it was a conventional mask that gleamed golden through the dark veiling, and the mummy whose head this mask had covered lay farther off, its body partly encased in gilded open work. Against the wall to the right leaned two "Osiris beds," flat surfaces on which seed had been sown, which in sprouting had outlined the figure of the god. Not far off, along the hall, opposite the door, stood a row of boxes like tiny closed sentry-boxes, each containing a statuette; in front of these, shoulder-high, the oblong black mass of a "sledge," the outermost case for a mummy. To the left stood a bed. Nearer again lay a silvered mummy-case; and on this, and on a second mummy beyond it, a shaft of cold blue light struck down from the outer day.

'By daylight, then, mingled with the light of flickering candle-flames, we examined the second mummy. By candle-light alone we searched the first. Both had been plundered by the thief of long ago. First breaking one of the "sledges" and throwing mummy-cases hither and yon, he had taken from both mummies everything of intrinsic value except a plate of gold closing the aperture through which the heart of one had been removed by the embalmers. Not a jewel, and only part of one necklace, remained of all those with which the dead must once have been bedecked. But if such trophies were lacking, those of surpassing splendour and significance still packed the tomb-chamber from hall to hall. In the bottom of a mummy-case, from which the thief had removed the cover, he had left a cushion and a graceful alabaster vase. In another mummy-case he had neglected an alabaster jar and the cover of an embroidery-box which he must have carried across the chamber to a second bed, on which it now lay beside a superb gilded chair. Near by, where the floor suddenly fell one deep step to a lower level, he had thrown, among a multitude of sealed jars, half of the gilded open-work casing which had encircled one of the mummies. Near these jars, again, he had propped a coffin-case against one corner of the tomb. Here, too, he had left a third bed, and one of the most important of all one finds in a tomb, a chariot, the curving front and wheel-rims of which shone through the darkness golden and scarlet.

'After such long burial, alabaster is at first curiously fragile, then firm again and strong; and gold-leaf is so delicate that it may peel off at the touch. Yet alabaster and gold-leaf—cloth, too, and veiling—were almost absolutely uninjured. The graceful alabaster vase, three beds, the mummy-cases, came glowing and glittering into the day. Near them we found a box containing "canopic" jars of alabaster—jars in which the viscera of the dead are preserved; also little sentry-boxes, each of them holding an *uspapti* figure, or image of a servant for the dead. Another box actually contained food—legs of mutton and other meats; and there were no less than seventy-two sealed jars full of fruits. All these things, and more, emerged from their long burial as dustless as when the tomb had first been closed. And as a certain alabaster pitcher appeared, a wasp came buzzing up and sipped what we maintained was the still fluid honey poured into it more than three thousand years ago to satisfy the human immortality cravings of Ioua and Tioua.'

Such was the discovery made when the tomb of the father and mother of one of Egypt's famous and most beautiful queens was opened. It is situated in an 'American dig' where, as already stated, excavations have been made through the liberality of an American gentleman who has become an enthusiast among the tomb-hunters. This is Mr Theodore M. Davis, an eminent archæologist from the United States, who has been engaged for about three years in burrowing beneath the sand and rock which lie in what is now known as the Valley of the Kings in the Thebes region. Only during the heat of the summer does the work cease, and at times the explorer has had a little army of nearly two hundred men engaged in the search. He it was who also discovered the tomb of the queen we have referred to—Queen Tii. While her burial-chamber had also been entered by the robber no one knows how many centuries ago, and most of its funeral decorations stolen, as well as the jewels with which she was undoubtedly decked, the alabaster mould encasing the head of this illustrious mummy was found unbroken, as well as a wonderfully beautiful garment in which she was encased. The making of the alabaster mask is one of the arts only known to the ancients who inhabited the valley of the Nile. The alabaster mould has been brought to America, where it has been carefully examined by experts in archæology. It is entirely of alabaster, with the exception of the eyes and eyebrows, which are composed of the substances known as lapis-lazuli and obsidian. The features preserved by the mould are of remarkable beauty, but, strange to say, little resemble the type of the ancient Egyptians, with the exception of the lips. The curve of the nose is more of a Greek outline. This has caused scientists to believe that Queen Tii may have been of European descent.

The features of the father and mother of this royal woman are also considerably different from the faces of other mummies which have been found in the Nile country. So carefully and artistically did the embalmers of this period do their work that when the remains of Ioua and Tioua were examined in their tomb-chamber the life-like expression on their faces caused the observers to be amazed. Although dark and shrunken by the thousands of years during which they had been walled up in the rock, the character of the features was as clearly shown as if death had but recently claimed the pair.

The extent of the tomb furniture and ornaments, and the ample supply of food which had been stored in jars and other receptacles for the benefit of this illustrious dead, can be realised when it is stated that a caravan consisting of no less than six camels and one hundred and fifty porters was required to transport the contents of this tomb across the desert to the Nile, where it was transported by steamer to Cairo and placed in the noted museum in this city devoted to Egyptian antiquities.

This was the way in which Ioua and Tioua made their last journey: They were first swathed with many folds of thin cloth completely covering them from head to foot. Then they were wrapped in a heavier fabric, and finally placed in little wooden boxes. Each box was securely strapped to the back of a camel, and beside it walked a guard of Egyptian soldiers, in addition to half-a-dozen porters, while every few hours the fastenings were carefully examined to see that they had not been broken. To prevent the natives from stealing any of the treasures, ornaments, or contents of the jars, another body of soldiers accompanied the porters who bore them.

VOICES.

'Come!' 'Tis the glad lark calling
My thoughts to the golden vales.
'Come!' 'Tis the bright brook brawling
'Neath the grass in the cloister'd dales.

'Come!' 'Tis the west wind flowing
Afar to enchanted isles.
'Come!' 'Tis the wild rose blowing
Soft kisses o'er blossomy miles.

'Come!' 'Tis an elf's sweet cry,
Sounded in star-domed wood.
'Come!' 'Neath a moon-chasten'd sky
A mermaid favours my mood.

'Come!' 'Tis the sea's sad song
Filling my listening ear.
'Come!' 'Tis the throb of the throng
That reels through life's thoroughfare.

Hark! was it an angel speaking?
Ah! yes, a sweet angel of earth,
Just as my fond dreams were breaking:
'Come, dear, to thy child-gladden'd hearth!'

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

DO we assume too readily that for the best and most restful holiday we must transport our minds and bodies to some region remote from their regular habitation, near the sea or in the country, up on mountains or to the streets and buildings of foreign cities? And can it be that, if the time is spent wisely and with consideration, the most enjoyable and healthful—yes, even healthful—change from the regular routine of the working year is to be obtained in the City with which we are most familiar, and where the greater part of our lives is spent? It is a point to be thought of; and, indeed, let it be said that there are some of the wisest men in London who constantly spend their longest holidays—those they care for most, and those which give them the most benefit—in the heart of the great Metropolis. We know of at least one person of a little eminence who annually bids good-bye to the members of his family and friends, and departs from his house in a western quarter for the enjoyment of his vacation. But the cab that wheels him away with his bags and general impedimenta does not take him to Euston, Paddington, or any other of the great railway stations which at this season are thronged with persons going far to the north, or to the south, east, or west, in search of change, but to some hotel in the middle of the town, where he settles himself for a month of enjoyment of all the riches of comfort and pleasure such as London yields perhaps more than any other city in the world. Approached in this way, the town affords a very real change to the man who moves about it constantly not as an independent seeker of relaxation and enjoyment, but as the busy workman who has little time for the contemplation of things that are outside his daily habits. The general aspect is different, and it is alluring. Never before did he realise how here he has the means of gratification of every passing fancy and of every long-standing dream.

Does the mind desire quiet and the contemplation of Nature and the solace of the singing of birds, there are places in the great parks where such quiet may be obtained, and the resting man may deceive himself that he is far from the throbbing centre of life; or, if there must be no deception, a journey that is less irksome than any of the daily excursions that are lightly undertaken during Continental trips will take him among the sweetest scenes up the river or to the most charming country of Surrey or Hampshire. Equal rest for the body with more pictures for mental food may be had in a voyage down the busy parts of the Thames. Days may be spent, if the holiday-making Londoner is so disposed, in seeing for once some of those sights of London that only the Londoner never sees; and, if the mind favours some investigations of a semi-original character, there are still strange things to be seen in the town that even the most knowing and observant of the residents are not acquainted with. Thus it was only the other day that a novel pleasure was furnished to us in the contemplation of a farmhouse in one of the most densely populated parts of London—Soho. There it is easily distinguished by a high-pitched roof with red pantiles, and there are two old-fashioned dormer windows looking down on the entrance to the gallery of a great theatre. Only forty years back, when the family who are the present occupiers, carrying on a trade of furniture trimming, first took possession, there was still a cowshed attached to the building.

* * *

Rest of another kind may even be had at one's own club—if it is one of the big clubs—in August, for we may enter there and find the generally crowded apartments almost deserted, and with books and papers by one's side, and with every home-comfort instantly obtainable from those who are the nearest approximation to one's personal servants, may doze away in roomy arm-chairs or on large stuffed couches. Or one may adopt any other conceivable means for change and the cultivation of health. One may

 [*All Rights Reserved.*]

swim or skate, spend a week in a home for rest in a West End square, or daily loll in the sweet coolness of the resting-chamber of a Turkish bath establishment, enjoying the most complete departure from the conventionalities of dress which are imposed by the times. Or any kind of game that has ever been invented may be played. Music, the play, or a hundred other varieties of entertainment of varying degrees of intellectual merit may be enjoyed in the evening; or the time may be killed at the great exhibitions, surrounded by myriad lights of different hues, while the indigo sky of night is open overhead and hung with its own million of twinkling lanterns, gentle zephyrs fan the face, the plashing of falling waters pleases the hearing, and a cornet solo from the band-stand makes one pause to listen now and then, but is not of so much importance that attention to it may not be ceased at any moment. All this is indeed very artificial; but, after all, it is the very best of its kind, and in this age there must be something artificial about the best and simplest of recreations. The greatest charm of a holiday in the town is the absence of all irritation and inconvenience. In the country, at the seaside, and on the Continent routines are prescribed daily and annoyances are constant. The life of ease and complete comfort cannot be led. Hours must often be observed for meals, food that is not entirely agreeable is sometimes served, and one is often uncomfortably aware that others take note of one's existence and one's customs. But in our great town there is no one who takes notice—at any rate in August, and when we wander in our capacity as holiday-makers. Among millions the individual is of no consequence and no interest. He may rise at his own hour, feed at his own time, and exactly according to his own fancy and wherever he will. He may lie in bed all day, and take his meals there, or he may not go to bed at all. Nobody cares; nobody makes any remarks. He may carry out any conceivable whim in the way of cure, regulate diet and habits to the very utmost nicety. He may do anything and be anything, from the British workman to a Chinese savant. And where are there more really healthy conditions of life to be had than in this great town? There may be little or no ozone in the atmosphere—it may be ordered, however, at short notice—but there are other things that make for health besides ozone. Those that do most in this matter are the things that one wants and likes, such as we have been speaking of. Is it not some indication of the merit of London, from these points of view, that when we come back to it from distant places we appreciate it the more each time, and for a day revel in all its convenience and comfort and the deep satisfaction which it affords? In July we may think that we have known London long enough for a lifetime; but at the end of August we are frequently of a mind with Dr Johnson, that when a man is tired of London he is tired of life, for there is in London all that life can afford.

While prudence and thrift are the most commendable of virtues, and generally approved, there is, we may agree, something to be said for the practice of the 'to-morrow we die' school in not counting the cost of a feast or holiday when once determined upon, either before it, during participation, or when the full enjoyment has passed and there only lingers in the mind a thin vapour of happy remembrance. Therefore, some all-wise adviser might reasonably at such a time as this counsel the public that is all bent on holiday-making and pleasure-seeking as at no other season of the year—bent on expending a larger sum on health and enjoyment than would be warranted on any other occasion—to be careful and calculating in the making of plans, and then to worry no more about mere matters of poundage and pence, for in such heart-burnings is there sure destruction of three-fourths of the pleasure that is to be derived from vacations. Let us accept the change that we find in our pockets at the end of these days of idleness as exactly the proper amount, without any reckonings, and go forward to the new account on the matter-of-fact system of daily life with this sum as the balance that was expected. There never was any reckoning of such costs that brought any satisfaction to the reckoner, or indeed did him any good in any way whatsoever; for where is the man who, having spent overmuch on having one 'good time,' and ruefully reflected upon it after with many determinations as to future conduct, did not, when time had in its usual process healed this little wound, go to enjoy another 'good time' with no regard for those old misgivings, but rather, in many cases, a subconscious determination to have the fling with less restriction than ever? So shall we say that the maxim of the moment is, 'Be prudent, or moderately prudent, and abandon care and too anxious thoughts of cost.'

* * *

Yet, while not reckoning up our own little bills, there is some harmless interest in reckoning up those of others, and those of great aggregates of people, of which we indeed make up our own little part. And it really does not unsettle the City clerk or small tradesman who is lolling in the sunshine and sparkling atmosphere of Margate, at a total cost of not more than three pounds a week, to be told that an American millionaire is just about to spend a little matter of fifty thousand pounds on the realisation of some freakish whim in the matter of holiday pleasure, or that the clerks like himself spend in the aggregate half a million or so during each week in the holiday-time. Lately we had the chance to meet a person who was peculiarly situated in his association with the holiday question, his business necessitating his studying costs and possibilities from every point of view, and having all manner of statistics at his disposal. He could tell you what everybody spent on holidays, and how exactly the money was distributed, and his

figures were apparently beyond doubt as to accuracy. A few items of information from the general stock were vouchsafed to us. In a certain limited sense, Switzerland is one of the most popular holiday-grounds in the world, and its popularity is increasing; although one of the most famous medical men of the day—one who is a favourite with the most exalted when they are sick—has vigorously protested against the habit of going to Switzerland as being too little restful for the folks who have to work in cities, and to us he said that it were far better that the City man should spend his three weeks or a month in bed than that he should use the time in climbing mountains from day to day. However that may be, the fact remains that the popularity of Switzerland has been greatly increasing during recent times, and the total number of hotels in the country has been more than doubled during the last twenty-five years. There are more than two thousand of them now, all fully equipped for the patronage of the wandering English—others also, but chiefly the English and Germans. In a year now it is estimated that no fewer than four hundred thousand visitors go to Switzerland, and that they spend a total of over six million pounds sterling, which means that every individual Swiss has about two pounds for himself as the result of the harvest that comes from the visitors. Lucerne has the lion's share of the spoil, for in the season before the last one no fewer than one hundred and eighty-six thousand visitors settled themselves there for long or short periods, and they left nearly two and a quarter millions of money in the place, which the inhabitants reckoned as meaning sixty-nine pounds a head for themselves. But it would appear that far more money is spent by holiday-makers in France than anywhere else, for the most reliable estimates of the country's revenue from this source vary from a hundred to a hundred and twenty millions, which means about three pounds per head of the French population; Italy takes twenty millions a year; and Norway, with a very short season, from half to three-quarters of a million.

* * *

These are large sums of money, and the mention of them might lead some ultra-philosophical minds on to reflections upon waste and want until it were urged again that man is not made for work alone. And even the British workman who takes his holidays humbly at Blackpool, or some such place as that, may wonder when he knows what expenditure he and his kind are responsible for in the month of August for holidays. These thrifty people have an excellent system whereby they save the money for their annual holidays week by week through the year, depositing it with clubs established for this special purpose, and withdrawing it when the time of 'wakes' or general holidays arrives. It was estimated that last year a sum of no less than two hundred and twenty thousand pounds was distributed in this way by the saving-societies of Oldham to their customers. At the society in connection with one manufactory alone, belonging to a well-known firm of textile machinists, a sum of twelve thousand and fifty pounds was distributed to the employés on the eve of the holidays. At Blackburn the saving-societies distributed over one hundred thousand pounds to their members when the holidays began; and one society, existing in connection with a Sunday afternoon chapel-meeting, disbursed sixteen thousand pounds to its members. Blackpool gets most of this money. Blackpool is a wonderful place, perhaps in a way the most wonderful holiday-ground there is in the world, although its peculiarities are perhaps not such as would appeal to all people so much as they do to these hardy toilers of the mills, who go there in their tens of thousands, and enjoy themselves completely. No wonder that Blackpool can afford to spend two thousand pounds a year on picture posters alone—pictures showing the piers and the boats on the sea, and the big towers, and wheels, and the shops on the front, all in bright colours that make the hearts of the cotton operatives long for the coming of August, and the wakes, and the closing of the mills, and the grand distribution of the holiday-money.

* * *

Just lately it has been the true season of the Park, and even as we write the season still lingers, and the Park for a few more days will present its gayest appearance. When not merely any Londoner but any Britisher refers to 'the' Park, there can never be any doubt that it is to the most historic park of all that he refers—Hyde Park. Of all the open lands of the entire country, even of the world, one might say, free to the passage and enjoyment of the public, this is the most famous, and so we must regard it as the queen of parks. Each month of the year sees it assume a different complexion, not merely in its foliage and flowers and tints, but in the people who visit it at regular hours of the day. Some there are—people tied to London, busy professional men who must take exercise of some kind daily, and naturally find this to be the most convenient place to take it—who are in the Park day in and day out; but these for the most part make up a sombre crowd, and the time to see the Park at its best is in the height of the London season, during the ten weeks or so when wealth and fashion are making their utmost display in the capital. Then indeed the Park seems to be the heart of all society, just as we might say that the quarter round about the Bank of England is the heart of all finance. Threadneedle Street and Hyde Park may be regarded as in a considerable measure the complements of each other. 'Why Hyde?' is a point that many people have wondered upon, perhaps, as they have strolled through the Park in the morning. It is just one of those little questions that the indolent townsman asks himself over and over again, and never takes the trouble to get any definite answer, such as is contained in the simple

statement that there was a manor of Hyde which belonged to the Abbey of Westminster, and good King Hal took the manor from Abbot Boston by a mock exchange in 1536, and His Majesty enclosed the first Park, in which, we are told, the French Ambassador went hunting in the middle of the sixteenth century. In later days the Park was thrown open to the public; but during the period of the Commonwealth it was put up for auction and sold, and not many people now have any idea how near London and the country came to losing it altogether. The man who bought it was one Anthony Dean, who gave the sum of nine thousand and twenty pounds eight shillings and twopence for it. This Dean was a shipbuilder, who reserved the timber that grew in the Park for his business, let out the pasture, and levied a toll on all carriages that entered. This state of affairs naturally moved some excellent Londoners to expressions of indignation, and we have Evelyn grumbling: 'I went to take the aire in Hide Park, when every coach was made to pay a shilling, and every horse sixpence, by the sordid fellow who has purchas'd it of the State.'

* * *

It is with such recollections as this and a thousand others—as of Old Noll driving through the Park ostentatiously the six horses which the Duke of Oldenburgh had given him, when he was pitched from the box of his carriage and a pistol went off in his pocket, but fortunately did him no harm—it is with such recollections that at this time, when the Park is thronged with the richest and most exclusive people, and it is really a sight of sights so far as the Metropolis is concerned, that one opens with pleasure a book that has been written by Mrs Alec Tweedie, and published timely by Mr Eveleigh Nash, on *Hyde Park: its History and Romance*. Mrs Tweedie gives us the whole story from the beginning, enlivening it constantly with the most piquant anecdote; and she not only gives us a pretty and true picture of the Park as it is to-day, but provides an account of such interesting matters as the birds that inhabit this open space, of the flowers that grow in it, the beautiful trees that at this moment show a verdure which would suffer little by comparison with the foliage of a country lane. A countryman might find it a little hard to guess what is the Liver Brigade; but they all know in the Park, and, as Mrs Tweedie says, this brigade is a regular London institution. Judges, barristers, surgeons, physicians, actors, writers, African millionaires, and German Jews all ride in the morning between half-past seven and ten o'clock. Many of them, as she says, are known to each other, and consequently friendly greetings and pleasant chats are exchanged while the Liver Brigade take exercise, knowing well that on their return home to bath and breakfast they will have to settle down to the Law Courts, chambers, or the consulting-room for the rest of the day. That hour's ride in the morning has been the salvation of many a brain-weary man and woman.

We have often pointed out in these pages how men and women in London in these days dress more for comfort and convenience and less for appearances than ever they did, and Mrs Tweedie greatly deplores the circumstance, and the difference that it has made to the show in the Park. Certainly now that the motor is such a feature of that show the Park is not what it used to be. The Park was not always a safe place of resort, and we are reminded that as late as 1772 its state was so bad that a bell used to be rung at fixed intervals in Kensington to gather together people who had ventured from London and were wishing to return. One night Horace Walpole was driving with a lady to some evening entertainment, and was held up by a highwayman on the road. The lady at once, with the most excellent composure, handed the robber her purse, which was bulging with money. He seized it and rode off, smiling with satisfaction; but the lady laughed last as she remembered that the purse had been thoughtfully stocked with counterfeit money specially for occasions of this kind. Duels in number there have been in the Park, as one might be sure without being told. One of them was in 1792 between the Earl of Lonsdale and Captain Cuthbert of the Guards. The latter was on duty in the neighbourhood when some confusion of traffic occurred in Mount Street, so that he forbade any carriages to come there. His lordship, driving by, was almost the first to be stopped, and was much incensed thereat. 'You rascal, do you know I am a peer of the realm?' he cried; to which the Captain answered, 'I don't know that you are a peer, but I know you are a scoundrel for applying such a term to an officer on duty, and I will make you answer for it.' And so they fought later on with pistols, and the gallant Captain had a narrow escape of the most serious injury, for a ball from Lord Lonsdale's pistol struck the button of his coat, else it would have passed into his body.

* * *

Some publishers of books tell us that the novels of the season are but a poor collection on the whole, and that inspiration and art are even less evident than they have been in recent times, so that the public are more and more disposed to rely for their lighter reading upon the cheap reprints of the classics or works of some established quality. Perhaps it is partly the result of the prevailing weakness in fiction that the taste increases for works of a light biographical and anecdotal order, a circumstance upon which we have previously commented. Almost every week sees some excellent addition to this library, and lately there have been two or three which have deservedly attracted attention. The inner history of affairs in the Victorian era is being constantly unfolded, and a most fascinating addition to the published works upon it is the little volume which has been published by Sir Theodore Martin, old friend of Queen Victoria, under the title of *Queen Victoria as I Knew Her* (Blackwood & Sons).

Its pages are few, but they are really valuable, and they give us some views and knowledge that even the bulky volumes of the Queen's Letters failed to do. We find it of special interest at the moment to contemplate what was the late Queen's attitude towards the prevailing question of women's rights and suffrage. In 1870, when there was much talk upon the subject, she wrote to Sir Theodore in this strain: 'The Queen is most anxious to enlist every one who can speak or write to join in checking this mad, wicked folly of "Woman's Rights," with all its attendant horrors, on which her poor feeble sex is bent, forgetting every sense of womanly feeling and propriety. Lady —— ought to get a *good whipping*. It is a subject which makes the Queen so furious that she cannot contain herself. God created men and women different; then let them remain each in their own position. Tennyson had some beautiful lines on the difference of men and women in *The Princess*. Woman would become the most hateful, heartless, and disgusting of human beings were she allowed to unsex herself; and where would be the protection which man was intended to give the weaker sex?' These were the words of one who, though she had to play the man's part during her lifetime, was ever and always, as we have the most abundant proof, the uttermost woman in feeling and instinct.

A PAWN IN THE GAME.

CHAPTER XXXVII.—WHAT THE TWO MEN SAW.

THE next morning, while the stars yet hung in the sky, the pair mounted and rode out of the ravine, halting for a moment as they reached the summit of the pass to look back. The shadow of the night still lay on the little valley, and still in unchanged attitude on the floor of sand slept the dead. With a wordless salute, a gesture of compassionate farewell, Jack wheeled his camel and rode away.

Their course lay to the east, though again and again they were thrust out of that track by lines of cliffs and the stony shoulders of the great hills. For hours they rode, Jack, with a thrill of expectation, scanning from each hill-top in turn as they reached it the eastern skyline in search of the sea. But there was only the unchanged landscape of the desert—a floor of sand, an horizon pricked with outlines of far-off purple hills.

At last, looking steadily betwixt two hills that stood apart, showing a clear segment of the horizon, he caught a streak of paler but steadier purple, and shouted in the fashion already described, '*Thalatta! thalatta!*' He was like stout Cortez when, standing silent upon a peak in Darien, he saw the Pacific. Jack stared with wild eyes at that band of far-off purple. Beyond it was England, with all that England held.

Sidi, however, had ceased to look eastward. That haze of colour was too remote to impress his limited imagination. He was staring at the nearer landscape. Something had caught his attention. They were in movement again by this time, but Sidi rode with head turned now in one direction, now in another, like a man who is listening. At last he stopped his camel abruptly.

'What is it, Sidi?'

The big ears of the negro were literally twitching with the strain of their owner's listening. His eyeballs were almost starting out of his head.

'Listen!' he cried, and he looked wildly round in the air. Jack stopped and bent his head. He was presently conscious of some strange murmur of sound that seemed to come from the upper chambers of the air. But it died away; and after listening for a few moments Jack, with an impatient gesture, put his camel in motion again. A sound as of a vast crowd heard in the lonely desert must be a trick of the senses.

Still Sidi rode with that strange attitude of intense listening. Presently he stopped again, and Jack drew up his camel also. Both men listened. Yes, there was a sound about them as of a moving multitude, the tread of many feet, the creak of wagons, the hum of voices. The sound came in rhythmical beats as though from the feet of an army on the march.

It was vague, far off, a mere thrill in the air; but it certainly was there. Was the desert enchanted? Last night the sight of the unknown dead on the sand; to-day the sound of the unknown living in the air! While the two men listened and stared about them, with a thrill of half-superstitious dread creeping through their blood, there came faintly a sharper sound as of metal. It was the ring of steel.

The ground fell sharply before them in a long, dry, curving ravine, like the empty and sun-scorched bed of some African Mississippi through which for thousands of years a great river had run, and now ran no more. As the two men neared the edge, that strange, soft tumult of sound that a few minutes before seemed to fall upon them from the upper chambers of the air now rose from beneath their feet. They stood at last on the edge of the ravine, and looked down.

A great column of men was moving beneath them. Their weapons, the orderly rhythm of their tread, told that they were soldiers. Here *was* an army on the march! For one bewildered moment Jack thought it was a mirage that cheated his senses. How had the lonely hills suddenly become peopled with an armed multitude in this fashion? But there was nothing of the uncertainty of a mirage

in the scene. All the characteristics of a modern army in full march were reproduced in the scene in the valley below them. There was the solid column of linked battalions, the officers riding on their flanks, the camels, the guns, the ammunition-wagons.

But it was an army of silence. No sound of pipe or beat of drum rose in the air. Even in the bewilderment of that sudden vision Jack noted the absence of military pomp and pride in it. The march was not merely as slow as that of a funeral; it was almost as melancholy. Men and horses alike moved with drooping heads and an aspect of weariness. The very camels shambled with stumbling feet and downheld necks.

By what miracle had an army been dropped suddenly into the hot solitudes of the desert in this fashion? Was it a defeated force fleeing from some overwhelming disaster? But the ordered ranks showed no sign of defeat, and the slow march was plainly not pricked by fear.

Presently another astonishment fell upon Lawrence. What he saw was a British force—the uniforms, the build, and the look of the men made this certain. But just then solid and far-stretching battalions of men with dark faces came round the shoulder of the hill. Regiment after regiment went by, and still the stream of dusky visages showed no signs of exhaustion. Whence came this army of white faces and black?

Sidi pointed at the scene and chattered and gesticulated with the utmost excitement, but Jack was frozen dumb by mere wonder. How did a British force with guns and ammunition-wagons come to be marching in this fashion through a waterless desert in a savage land? Towards what battlefield were they pressing? In the tumult of astonishment which possessed him clear thought was impossible, and yet Jack found a clue to the problem in the battalions of dark faces marching beneath him.

They plainly came from India. They must have landed on some part of the coast of the Red Sea, for no other waters lay to the east. Marching westward, it was equally plain they were striking inland towards the Nile. An Indian army marching from the Red Sea to the Nile! There must be some great expedition that took in both India and England on foot.

But Jack stopped no longer to speculate. He put his camel in motion and plunged down the stony slope of the ravine. Presently the sound of rolling stones attracted attention below. An officer looked up. He saw two Arabs coming with almost reckless speed down the side of the hill towards them. A word of command ran along the column. It halted. The men began to handle their arms. Two or three officers put up their glasses and examined the approaching figures. A mounted officer came cantering from the head of the battalion to see what had happened.

Jack came on at breathless speed, but found himself unable to speak for mere wonder and joy. British faces and uniforms were before him! An officer had stepped out to meet him, followed by a sergeant and a file of men, while other officers were searching the crest of the ravine with their glasses. Had these Arabs any followers? For the officer waiting to meet Jack saw before him only an Arab, lean and brown, a long gun slung behind his shoulder, a white rag about his head, a huge negro riding behind him.

Jack showed no signs of pulling up his camel, so great was his gladness to find himself amongst friendly faces.

'Stop the beggar, sergeant,' said the officer.

The sergeant put his musket across the nose of the camel. Jack looked at the face of the officer. It was freckled, burnt, dusty, with blue eyes beneath the scanty straw-coloured eyebrows. Not a striking or intellectual countenance; but Jack's heart seemed to leap into his throat as he saw it was the characteristic face of a countryman.

'I am English,' he said briefly and with a broken voice.

'English, by Ged!' cried the officer in astonished tones; 'you don't look it.'

The sergeant, with the file of men behind him, grinned. Here was an Arab of the Arabs claiming to be English! Jack saw the numeral '10' on their hats. It was the Tenth Regiment of the line.

'Who are you, my man?' asked the officer. 'What are you doing here?'

'I am English,' repeated Jack. 'I have been a prisoner amongst the Arabs for years, and have made my escape.'

A murmur of sympathy rose from the men.

'Were you wrecked on the coast?' asked the officer. 'What is the name of your ship?'

Jack shook his head. 'I do not belong to the navy.'

'Are you in the service?' asked the officer eagerly. 'What was your regiment?'

'No, I do not belong to the army. I was in the Foreign Office.'

'The Foreign Office! Egad, they would not recognise you in Whitehall to-day.'

Another officer meanwhile was questioning Sidi.

Jack had regained his self-command, and commenced to put eager questions. 'Where have you dropped from, and who are you?' he said.

'Oh, we are Sir David Baird's force from India, on our way to the Nile. We are to join Sir Ralph Abercromby's army in Lower Egypt.'

Yes, Jack had stumbled on that most daring expedition in British history. The men at the head of affairs in England were civilians, but they planned on a large scale and showed some imagination in their plans. They had sent Sir Ralph Abercromby with fifteen thousand men to Alexandria, while Baird with eight thousand men was to cross the Indian Ocean, grope his way up the Red Sea, land if possible at Suez, and join hands with Abercromby on the Nile.

Here was an expedition coming over almost unknown seas to uncharted ports, carrying an army which was to march across one hundred and thirty miles of waterless desert, drift down the Nile in boats, and join hands with another army sailing from English ports. Napoleon's 'nation of shopkeepers' had set on foot an adventure more daring than any he himself had attempted.

Jack now understood the black faces in the army. He understood, too, the funereal melancholy and slowness of the march. Here were troops newly landed from crowded transports marching under the pitiless African sun, and suffering the torments of thirst and dust as they toiled across the weary miles of hot sand.

'You must tell your story when we camp,' said the officer who had ridden from the head of the column. 'We must get in movement again.'

A brief word of command ran down the column, and with the rhythm of disciplined feet it was set in motion again; and like a man in a dream Jack rode beside the battalion of the Tenth.

Presently he dismounted. Sidi took charge of his camel, and he walked beside the friendly officer, picking up with eagerness all the news of the civilised world since he, trudging at the tail of the old sheikh's camel, had vanished from it. He heard the story of Napoleon's return to France, of his rise to power as First Consul, of the victories like a procession of thunderclaps that had struck down Austria, the tale of Hohenlinden and of Marengo, the story of the fall of Pitt from power just to hand, as well as the news of Abercromby's landing at Alexandria.

The officers of the Tenth plainly regarded all this as of less importance than the story of their adventures as an expedition, and these were sufficiently strange. Strong winds had scattered the fleet while crossing the Indian Ocean and coming up the Red Sea. The General had arrived at Kosseir, to find the Admiral missing; the flagship had found its way, a solitary sail, to Suez. The transports came straggling in like broken-winged sea-birds, and were collected in the Bay of Kosseir; General Baird could get no news of what was happening in Lower Egypt. To march inland might mean the loss of the whole army. It seemed impossible to go forward and intolerable to go back.

At last the news had come of British success. Alexandria had been won, but Abercromby was dead. General Hutchinson had assumed command in his place, and was marching on Cairo. Baird was now pushing his men across the desert betwixt Kosseir and Geneh, and thence to the Nile. When they reached the river they must sail or march down unknown hundreds of miles, and join hands with Hutchinson's men.

Jack listened like a man in a dream. Yesterday the desert solitudes lay about him, the world of his fellow-men seemed remote and almost unattainable. To-day he was riding beside a whole army; the great tale of the world was filling his ears—tidings of the fall of kingdoms and Cabinets, the clash of battling hosts. He was glad when night fell and the army encamped. He flung himself down on the sand, exhausted with the crowded events and strange emotions of the day.

Sidi, on his part, had less susceptibility to emotion than his English comrade. He had discovered some negro servants attached to the officers' mess, and sat laughing and chattering with them as though they had been his closest kinsmen.

(To be continued.)

WHEN ALL THE WORLD IS YOUNG, LAD!

By Francis Cunynghame.

A BRIGHT sun in a cloudless sky, the heat quivering on the river, a cluster of white and a pink sunshade at the bottom of the punt, and the endless rhythmic upward and downward movement of the pole. Such is the picture.

Of course there are people who hate the river, and would refuse to go on it for worlds—Johnnies, for instance, who consider it inexpressibly dull; others who feel seasick; and others still who would deem your river-folk both fast and foolish, not to say immoral. But then, of course, these last people are unmitigated bigots, who shut themselves up in their coal-cellars, with nothing but their own noses to see in front of them—that is, even allowing that they can see at all. How can they know the joy of finding yourself far away from the noisy town, moored to the bank of a thick-wooded island all smelling of forget-me-nots and wild thyme, with a charming girl sitting opposite you in the bow? It is part of a big picture, well focussed, and with harmonising colours, and it is all summed up in the mind of the initiated and the connoisseur in that single phrase 'a day on the river.'

You get up at your usual time, and have a nice, satisfying breakfast, consisting of porridge first, then a little fish, and a mutton-chop or kidneys-and-bacon, followed by a boiled egg, some marmalade and fruit, with a slice or two of ham, perhaps, if you feel hungry, to fill in the odd gaps. And then, having read the paper, you collect together 'a few things you may want,' and reach the station as the clock strikes eleven. All very jolly and comfortable so far, but where is the girl? For, naturally, you have asked Adeline, Betty, or May to come with you. Of course, you have; *il va sans dire.* You take the tickets, and then drop them in the effort

of trying to buy a couple of magazines whilst carrying at the same time a bottle of moselle, some French cakes, a basket of strawberries, and a lady's sunshade, which she left behind the last time you were with her.

You wait patiently and look at the bookstall until you find yourself in the way of a truckload of luggage, when a courtly 'By your leave, sir!' makes you jump like hot cakes, and you spill the strawberries, and the boy behind the bookstall picks them up for you, and grins at the parasol. You then stand at the gate where they snip the tickets. But no girl. And the train goes in two minutes! Your *sang-froid* now deserts you, and you stand on one foot and then on the other, then you begin to stamp, and finally pace excitedly up and down like a beast before feeding-time at the Zoo, and collide with every choleric old gentleman who fancies he is late for the train.

And then at last she comes, in a fearful hurry, with a thousand excuses, and 'What a dear you are to remember my sunshade!' And you rush through the gate and are bundled higgledy-piggledy, pell-mell, into a carriage by a perspiring porter; and the train moves out.

The river!—the beautiful, shining, gay, irresponsible, transparent river! It is lunch-time, and you have punted energetically for three miles, past the dull outposts of the town and waterworks; you have gratefully, being hot, entered the shady reaches of Little Ditton, where you became extremely lazy; and have at last by sheer lack of time and the exigencies of the feebler man within pushed on at a good speed past the Palace to the backwater below the weir. And Adeline or Betty or May will say that this looks a very nice place; and so here you stop, and hang over the side and catch and grapple and wobble about—in fact, do all and sundry of the different tricks people perform when they moor to. Then a feeling of compunction and the rightness of things in general seizes the girl, and she asks whether you don't think you ought to get beyond the lock before lunch, for remember it is a long way to Sunbury; 'and you know we promised the FitzWhat's-their-names we should get to the picnic by three o'clock.' You make an instinctive note in your head that if there are any powers on earth that can prevent your getting to the FitzWhat's-their-names' picnic those powers will be called into action, or you're a gone coon. For, fancy the idea of having to go and make yourself entertaining at a picnic, fetching water and washing-up things, and all that kind of rot, when you might be at the bottom of a punt with the dearest girl in all the world beside you, and just doing absolutely nothing but playfully teasing her and tickling her nose with a dandelion! Besides, one picnic in the day is enough for any one, let alone the fact that you have carted the moselle and the strawberries and the cakes from town, and a heavy luncheon-basket all the way from Tubbs' boathouse.

And then, dear lady, think of sitting on the grass in your best flannels! For if there is one thing a man does pride himself upon, it is his appearance on the river. A pale-blue striped shirt, a low turn-over collar, his old school colours in a tie, brown leather belt, immaculate trousers with a mathematically straight line down them, white boots, and on his wrist a watch; and then, when he steps ashore, a plain straw hat on his head, and on his back a blazer or the usual lounge coat and waistcoat—*en effet*, he is at his best, and he knows it. And so is the girl, for all river-girls look nice whether in white or pink or blue or the daintiest of rose-patterned muslins. They carry beautiful sort of hand-painted sunshades—at least some of them do—and have the loveliest of hats and the dearest little faces in all the world.

Naturally, therefore, Adeline, Betty, or May—or whoever the girl is in this instance—is both charming and fascinating, as you have already gathered. But you should see her getting out the luncheon-things, and laying the cloth, and dipping the glasses into the river—oh dear!—because they're not quite clean enough already in her estimation! All you can do is just to sit back at the other end of the punt, watch her energy, and take a quarter of an hour opening the moselle.

There is nothing like a river picnic really, if there are only two people to share it. It is much more fun than a crowd. For, as any one can imagine, there is nothing more trying than being one of six in a double-sculler when some one is trying to pass you the cold chicken—you're lucky if you get so much as the plate! But with two sitting *tête-à-tête* together, with enticing things set out before you on a board that is laid across the sides, and a nice tablecloth, and all—why, what more could you wish for on a summer day when all the world is young?

And then at last you have got those beastly wires undone, and the cork goes pop, and all the precious nectar inside bubbles over. It is one of the most delightful, wickedest joys in creation to let off a champagne cork at a passing boat; and the fat party steering remarks with a sneer, 'Oh, champagne indeed! Hope they won't capsize coming back!' And so you pour it into the glasses, undo your paper napkins, and set to with gusto; and mighty glad you are to have something after the exertions of the morning! Then you take up your glasses and clink them together, and look into each other's eyes; and the whole world smiles with you, and the sun shines, and you are very, very young.

Luncheon is over, things are moderately washed and packed away, crumbs collected from the floor, and the rope that moors the punt unfastened. It is about three o'clock already, and the dear girl has insisted on going to the FitzWhat's-their-names' picnic. 'You know, we need only stop there half-an-hour,' she says. So, willy-nilly, one must try to gather together a little of one's erstwhile

strength and push on. There seems to be some rather indistinct idea that one slept a little after lunch, because one remembers being brought to the proper sense of things by a nasty bumping against an outstretched tree-trunk, occasioned by the wash of one of those beastly great big steamers with bad gramophones on board. But that may have been a passing fancy. However, work, work, work now, or one will never be at the picnic—and the devil take the hindmost!

First, of course, there is the fun of the rollers, which is only exceeded by the fun of a crowded lock when the lock-keeper wants to know how long you are going to prevent every other craft of known or unknown denomination from entering. But then, provided you can get some one to help you up with the other side of the punt, there is really no difficulty; you have landed her at the top in a jiffy, and are far away from the evil smells of the launches before you can say 'knife.' Then, again, punting on past the house-boats and along another dull stretch of flat country, at last you reach a sequestered glade behind an island, where the river is so shallow that you can touch the bottom, and weeping willows toy in the waters as the summer breezes pass by them.

This was to be the meeting-place. And sure enough there is no mistake about it. For the Fitz-What's-their-names skelter down to the bank and help you ashore, and shake you by the hand till you wish the whole lot of 'em were at the bottom of the river. Then you resign yourself for at least two hours, and look perfectly bored. Ordinarily a sort of show like this is rather amusing; but some people haven't the knack of doing things in a sensible way. Mrs FitzW. informs you that you are not the last to arrive. 'Oh no, pray don't apologise, for the skiff with all the water, and the kettle, and the rest of the things hasn't put in an appearance yet.' This is just like one's luck. So one sits down in a bare, empty space, before a huge white tablecloth, and tries to talk to a fellow with beans in his mouth, whose only conversation consists in anecdotes *à propos* of the dances he has been to. Rather uninteresting to a fellow who never goes to them!

Half-an-hour passes; a skiff is seen approaching in the distance. The whole picnic party gets excited and waves like Robinson Crusoe when he saw a sail. And sure enough the skiff has no wish other than to make port under the weeping willows; so every one troops down to meet it in a body, headed by FitzW. himself, who is short and stout, and wears a cabbage-leaf at the back of his hat. And then, wonderful to relate, who should be in the skiff but young Bluebottles and his fiancée! Fancy entrusting the kettle and the water and the rest of the show to an engaged couple—and Bluebottles, of all persons! Bluebottles is the most careless, devil-may-care person in all the world, wears blue glasses, and looks rather like a Chinaman. Mystery how he got hold of the pretty girl he is to marry in two months' time; but so he did, and Heaven bless them! They both have thousands of excuses on the tips of their tongues about trains leaving earlier than they were scheduled and the boat having sprung a leak. Nobody much cares for their excuses, however, as every one wants the kettle.

A quarter of an hour passes. Five sturdy lassies have coaxed a fire and made the tea, and every one sits down to enjoy it. Another half-hour and you begin to think it is time to go, when one of those fearful busybodies suggests rounders. Awful game rounders! And of course young Teddy FitzW. has stump and ball and everything bang ready; so half of the people are sent to digest their tea in this manly toil, and the younger fry (including yourself) are set to play the appalling game where you run behind some one else's back before a second some one else has time to catch you. And, of course, no sooner have you got behind Adeline, Betty, or May's back, and are just discussing the subject of how to make a graceful exit from the proceedings, than it is time to run again to some other party if you don't want to get caught. And to be in this predicament is a great disgrace and an appalling nuisance as well.

At last, however, Bluebottles comes to the scratch and goes up to bid Mrs FitzW. good-bye just as that good lady is arranging to send couples off into the wood for half-an-hour 'to amuse themselves'—no doubt a splendid arrangement, and they may be amusing themselves together there to this day for all you can tell or care.

The picnic then, as far as one's self is concerned, is over. You heave a sigh of relief, and vow one thing, and that is that you will never come to one again. Then you go down to the boats, and Bluebottles suggests you should swop. The girl hates steering and is much more comfy in a punt, but they hadn't got one at Tubbs's when they left. And Adeline, Betty, or May is luckily of the entirely opposite opinion; so you agree, for you rather fancy the different exercise. You immediately start, therefore, to throw all Bluebottles's belongings out of his boat, while the good chap gently lifts all the things out of yours. You get into the skiff, Bluebottles pushes you off, you take up the sculls and feather them into the rowlocks with a neat movement of the wrists, and away you go.

It is the same story: past the same low stretch of open country to the lock and down the rollers, past the Palace and the Mole to the house-boats and Little Ditton. Then soon it grows dusk, and a slight miasmal vapour rises over the water, the lights come out one by one, and they are all palaces that border on the stream, and there is no sound save the swish and gentle grating of the rowlocks as you pass from earth to fairyland and the world of dreams.

And then presently, ever so softly, comes the sound of music, and the girl at your side whispers, 'Hush!' so you rest on your sculls and listen, turning round and peering into the darkness. It is

a voice as pure as crystal, a rich, impassioned tenor, and the words are those which you know so well and become the sadness of the darkening river, '*Ah che la morte ognora è tarda nel venir.*' There is the wild, despairing cry of *La Miserere*, '*Addio! addio, Leonora! addio!*' and the music stops. You allow your sculls to play gently with the water, then take them out and drift slowly down.

There is a house-boat all white, with Japanese lanterns and fairy lights and baskets of marguerites and geraniums hanging around. And all about in the water is a world of tiny craft—punts and skiffs and dingies and electric-launches. All are waiting —a silent audience—at this impromptu concert. Occasionally a girl's laughter breaks the silence, some one lights a cigarette and shows the outlines of a handsome face and the dim features of those about; occasionally an oar dips, or the drops of water from an uplifted punt-pole sparkle and catch the light like a spray of diamonds. Then again there is a song, and it is Musetta's well-known melody in the second act of *La Bohême*, with all the meaning and all the pathos that its notes contain. A faint sound of clapping; the girl beside you leans over and whispers, 'Gramophone,' and you are loath to hear the word lest it should break the illusion; but you marvel instead that there is no trace of the instrument in the voice, only the rich, passioned notes of a Melba or La Tettrazini.

You have stayed here long enough; one by one boats have slipped from the rest and got lost in the darkness. Silently you also creep away and pull down-stream. Five minutes pass; a song comes to an end, and then a new one begins. You listen again. It is a barcarolle, and sends one back to Venice and the Italian lakes and the shores of the Bay of Naples:

> Sul mare luccica l'astro d'argento
> Placida è l'onda, prospero è il vento.
> Venite all 'agile barchetta mia,
> Santa Lucia, Santa Lucia.

It is so far away now you can but just catch the music, but the words come back to you in the echo. Then your sculls dip ever so gently again, and the boat glides on out of hearing and there is no more sound; only the world and the stars above and around, and close by in the darkness the dim features of the girl you love.

FATE TAKES UP HIS FIDDLE.

HALF-WAY up the pier at a popular south coast watering-place sat a man looking, with eyes that took in nothing, down on the dancing waters. He was a tired man, and had snatched a fortnight from the paper which paid a trifle for his nights with the idea of running over to the Continent and losing in some babel of foreign tongues an identity of which he was sick to the death. At the last moment energy had failed him, and he had tamely booked to this old 'resort,' to which he had so often come with his people as a child. Well, his 'people' were all dead now, or all, at any rate, who cared whether he was alive or dead himself.

Reckoned by mere years, Clarence Archdale was still a young man. The period somewhat fatuously called the 'prime of life' lay more than ten years ahead of him, yet he felt that, if he had not indeed passed it long since, he would never get there. Journalists are often older than those in less precarious trades. Youth goes with the illusions, and there are few careers in which you part with these earlier or with less struggle. Archdale had gone down from the 'varsity—was it fifteen years ago or fifty?—full of promise and ambition. Neither had been fulfilled, for his was not the work that satisfies a crowd which demands omniscience at one half-penny. Up went his head, as if in defiance of some unspoken thought, and now his eyes rested on the old castle amid the ruins of which he had played as a lad. There also, a little later, he had wooed her with whom, when life's prizes seemed to lie within his reach, he had dared to dream of the 'fellowship more quiet even than solitude.' Well, he had the solitude instead, and she, as soon as his failure to 'range himself' was apparent beyond a doubt, had married the soldier-cousin, brave in all the honours of a frontier war, and had gone out to India. He had never seen her again, and he had never loved another woman. Life, which could have given him so much, had done nothing for him. Never, since the vealy triumphs at Balliol, had the chance of distinction come his way, or at any rate he had never seen it. He wondered. Here he was to-day, after fifteen years at the mill which grinds even those who turn it, and his income had only recently attained to the dignity of Mr Asquith's notice.

Once more his eyes sought the water, and life seemed as futile as the effort of those endless waves, rolling up to the shingle, hurrying back for reinforcements, then returning to the charge and spending their strength, all to polish a few pebbles! He pushed the soft felt-hat back off his brow, and marvelled that he should have taken so commonplace a holiday; he who, in college days, had sworn that fastidious hatred of the profane crowd which has classical authority and marks the eclectic undergraduate at his worst. Fancy him sitting here in a crowd that listened to the too familiar waltz of the 'Merry Widow,' which a band was playing on the parade. At least, he thought, if the Continent was too much fag, he might have sought a blessed fortnight's forgetfulness of life's vulgarities in some sweet Cornish cove, with no companions but the

grim old cormorants drying their wings on sun-bathed rocks in an attitude suggestive of the lectern in the village church. Why had life given him no chance, no single chance? Other men of his year had risen in the world through influence, push, luck, anything but merit. Ogilvie, who had married the plain daughter of Graythorne, the biggest solicitor in Lincoln's Inn, had taken silk, and was doubling his wife's already handsome income. Barton, to whom that South African millioniare had taken a fancy on the Union Castle boat on the way out to Madeira, was managing mines (of which, at any rate at the time, he knew nothing at all), and had an income of four figures. Only he, Archdale, had been left. Let us not too severely blame the fallacy of his argument; we have all looked on life from the same standpoint before now. Deep in the back-numbers of memory he delved for evidence of one single stroke of luck that had been his. He honestly thought his quest impartial, but how could the search be other than fruitless with him in such a back-to-the-wall mood as he was at present?

Of a sudden, brought back to earth from the shadowy mists of a profitless past, he realised that his eyes had unconsciously focussed on something of more pressing interest. Breasting the rollers, close beside the pier, was a fair-haired lad, evidently not enjoying his swim as he should. Archdale remembered even now that he had never been a swimmer. A weak heart, which he had lived down by the time he was thirty, had precluded any kind of athletics in his school-days. As he could not swim, he did not even bathe, for the spectacle of immense red men in exiguous bathing-drawers dancing at the rope's-end by the machines had always disgusted him beyond words. And now he realised that the lad was in difficulties. The tide, high a few moments ago, had turned to the ebb, and the current was setting strongly to the westward. It evidently had the little fellow down there at its mercy, and was taking him towards the pier. The little swimmer threw himself on his back, probably for rest, and his fine young face was twisted with a look of fear. Archdale sprang to his feet and looked round for help. Hang it! if he had only been a swimmer he could have saved that little life. But for this—— Hang it, again, the boy had gone! Before he quite knew how, Archdale had leaped on the rail and dropped feet first close to where the boy had sunk. A practised swimmer would instinctively have kicked off his shoes and thrown off his coat; but, you see, he had not the instincts of a swimmer, and went in as he was. A score of those on the pier rushed to the spot, a hundred others rushed down the beach, and three rowing-boats converged rapidly on the figures floundering together in the water, Archdale and the boy equally helpless and now going down together. But strong hands reached out, and, amid wild cheering from the shore and overhead, dragged them from death. On the beach they lay gasping for breath, the centre of a now enormous crowd. A longshoreman was making critical remarks about the rescuer's behaviour in the water. 'Bloke looked for all the world as if 'e couldn't swim 'isself!'

Through the crowd pushed a man who, you could see with half an eye, meant getting there, assumed his right to be in front. The clean-shaven, square-jawed face was redeemed from heaviness by the waving hair that escaped from beneath the Panamá and by a pair of eyes that just now looked tender as a mother's. An American, every inch of him, he just pushed aside those who blocked his path to right and left, and fell on one knee beside the still unconscious lad. Through the fairway he had made in that sea of humanity came a younger man, self-possessed, yet evidently a prey to strong emotions. With the help of a policeman, they carried the boy between them up the beach, and he was driven off in a fly with the younger man for company. The elder, he with the face suggestive of a copy of Meissonier's 'Napoleon' a little out of drawing, returned to the beach and made some inquiries of the bystanders, with the result that he made his way to Archdale, now on his feet and feeling foolish in his dripping clothes. The two presently moved on in close conversation, and one or two of the more curious in the crowd, very jackals for such scraps of talk as they could gather without being snubbed, heard such fragments as:

'Say, and you can't swim! . . . and yet you legged it over the side after my little one!'

Archdale, with an Englishman's deprecation of heroics, admitted that this was so.

The American was a hard man. He had ground his lesser rivals in the mill and slept of nights, for such were the ways of his country. Yet he swallowed a lump in his throat, and held out his hand to Archdale, who felt his own gripped in a vice.

They were on the parade now, and Archdale had hailed a cab, anxious to get back to his hotel and change his things.

'Then you 'll dine with us, anyway, this evening, unless you would rather go straight to bed. Queen's Hotel, seven-thirty.'

Archdale was sure that he did not want to go to bed, and the American handed him a cigar (which he took from his breast-pocket) and also a card, on which was inscribed 'Sherman P. Dunster, Dunsterville, Pa.'

. . . . . .

After dinner, over the port and nuts, Archdale found himself telling his host more of himself and his life than he had ever remembered telling any one before. What he did not realise was that he had never before had so good a listener. It was the way of Sherman P. Dunster, of Dunsterville, Pa., to listen while other men did the talking. That was how he had come to own five million dollars' worth of real estate. But he was not at this moment bent on increasing them. His thoughts were running in an unwonted channel. Instinc-

tively, however, he realised that he had to deal with a proud and sensitive young man who must be driven gently. It is only in books written by dismissed servants or disillusioned immigrants that the American capitalist is a wholly brutalised machine without one human instinct. Sherman P. Dunster, who could be as hard as a flint, could also be as tender as a woman. So the evening passed pleasantly enough, and after taking leave of the ladies—including a pretty daughter with violet eyes and a soft accent that Archdale at once lost his heart to—he returned to his hotel.

An acquaintance begun in such circumstances soon ripens, and during the next week he was constantly with his new friends. Then he had to get back to Fleet Street, promising to dine with them the following week at Claridge's on their way back to the States. As he sat in the train his thoughts ran pleasantly on the episodes of the past few days, or at any rate on all in which Violet Eyes had figured.

He turned the key in the door of his dingy chambers in the Temple, and found only two letters—one a particularly offensive summons from his chief, who had evidently been short-handed. This he had opened first in case there might be anything urgent. The other was marked 'Wait arrival' and post-marked 'Hastings.' Hastings? Whom did he know there, except—— But he ripped open the envelope, and this is what he read:

'Queen's Hotel, Hastings, *August 27th.*

'My dear Mr Archdale,—This letter will await you at your London address, which I have found in the Directory, as I am anxious not to disturb our few remaining days of pleasant intercourse here with anything in the nature of business. I have gathered from your conversation that you are not tied by any close bonds to the old country. I have also gathered that you have had considerable experience with high-class newspapers. It so happens that I am proprietor of the *Dunsterville Comet.* It has not hitherto been high-class, but it is going to be right now if you will take over the editorship. Now, don't jump on me and think I am trying to repay you for an act of bravery. One does not pay for such deeds; they are their own reward. But I know that you would be the right man in the right place, and if you take the job you will leave me your debtor. If you could make all arrangements to come out with us, there will be a berth for you on the *Caronia,* sailing on the 15th of next month, and we can fix up all details on the voyage.—Yours cordially,

'Sherman P. Dunster.'

Archdale uttered a wild whoop and kicked over the only sound chair in the room. This brought over the threshold a shock-haired individual with a well-seasoned inquiry as to what the noise was about. Archdale pressed him to come out and dine, to carouse, to get drunk on old Falernian. The shock-headed intruder intimated 'without prejudice' (he was a barrister on the Chancery side) that his friend certainly had no immediate need of either old Falernian or new Highland Glen, but eventually, on hearing his news, surrendered to the mood of the moment, and the two presently went off to seek entertainment.

. . . . . .

Majestically the *Caronia* steamed up the middle of New York Harbour. It was a glorious morning, and the Statue of Liberty seemed to smile less ironically than usual on the huddled immigrants who had given up one slavery for another, who had fled from the tyranny of Czars to that of the dollar. Archdale leant over the rail, and beside him leant Violet Eyes. Friendship does not halt on board ship, particularly between two young people who are excellent sailors, who develop a common interest in bull-board and deck-golf, and who prefer walking miles round the promenade-deck when the rest of the passengers are hanging their legs out to dry over the arms of deck-chairs. For the next three months Violet Eyes was going to stay with friends in New York. The first day out from Liverpool she had been anticipating with all a young girl's enthusiasm the pleasures of that visit. The last day or two, however, her interest in it had perceptibly waned, and now the minx was actually impatient for Christmas at dear old Dunsterville.

Archdale had just expressed the hope that he would still be there. He had insisted, in his pride and independence, on a three-months' trial, at the end of which, if he felt unequal to his new duties, he was to return, handsomely reimbursed, to Europe.

'Why, sure,' said Violet Eyes, 'and why shouldn't you?'

'Well, you see,' was the reply, 'the experiment of an editor out from home mayn't answer. I'm not sure that I'll be up to the hustle and bustle of your country.'

'Oh, you'll learn. We'll teach you.' The eyes were dancing now.

'Anyhow,' was Archdale's next remark, 'I'll never live another week like this has been—never. Life can't hold two such weeks of freedom and completeness. I never lived before.'

Oh, memory! what of the matron even at this moment, in far-off Simla, going in to dinner on the arm of a military star of the first magnitude?

'Why, now, that's lovely of you to say so, Mr Archdale; but—but why "freedom and completeness"?'

For answer, he took up a little book that he had been pretending to read when she came along from her stateroom. It was a dainty volume of Stevenson's essays, such an old favourite of his that he knew long passages by heart. Finding the place he wanted, he closed the book and handed it to her with a corner turned down.

'Read that essay, will you?' And soon he left her, going to see his steward about the small baggage.

Cynthia, with a little shrug of the shoulders, carelessly opened the book, and, reading down the page, came to words that sent the blood mantling the whiteness of her neck and brow like sunrise on the snow-line: 'To live out of doors with the woman a man loves is of all lives the most complete and free.'

And that was how he told her.

THE MONTH: SCIENCE AND ARTS.

A SIMPLE RAT-EXTERMINATOR.

DURING the past few months the question of rat-extermination has been keenly discussed, with the attendant result that innumerable specifics of a secret nature have been launched on the market, each of which is claimed to possess infallible qualities. Whether such be the case or otherwise, the fact remains that the trap and terrier still stand as the most effective means of destroying the vermin so long as these repressive measures are carried out upon a continuous, systematic basis. That there are, however, numerous other simple remedies which possess certain valuable efficacies in this direction is very possible if the means of application were but known. For this reason, the experiments carried out by a German investigator are worthy of notice, for his instrument of destruction consisted of the sea-onion or squill. This article has frequently been described as an excellent medium for the purpose, but it has never been subjected to such scientific tests as those imposed by the above-mentioned experimentalist. His *modus operandi* was to crush the sea-onions in a machine with potatoes, which absorbed the juice of the squills, and to cook the mixture in a frying-pan with plenty of fat, so as to make a kind of crisp cake. This was distributed throughout the stables infested by the rodent, together with dishes containing water. In the morning no less than forty-three rats that had partaken of the dish were found dead. The result was surprising, since it was not believed that so many animals existed in the building, and under the circumstances it was feared that, owing to the insufficient quantity of the bait, some of the vermin had escaped unscathed. Further quantities were consequently prepared, being combined with minced meat for a change, but the rodents had become wary after the first experience, and the food was left untouched. The investigator accordingly suspended operations for some three months, when he again concocted the squill-potato-fat food, laying adequate quantities throughout the building. This time thirty-two dead rats were found, and no signs of the pest have been seen since. From this it would appear that the sea-onion, despite its simplicity as a remedy, has certain rat-destroying possibilities, and its value in this direction is enhanced from the fact that it is fatal only to the rat tribe. Considering the readiness with which the raw materials can be secured, it offers a cheap and ready expedient. In preparing the food, however, care must be exercised to prevent the juice of the sea-onion from coming into contact with the hands, as it sets up painful burning.

A NEW PURIFYING PROCESS FOR MILK.

The ensurance of a pure milk-supply possibly constitutes one of the most difficult scientific problems of the day. This is but natural, seeing that this liquid food constitutes a stable item in our dietetics, especially for the young. A long range of processes have been evolved for securing the desired end, from pasteurising and refrigeration to electrolysis and chemical sterilisation; but one and all are only partially satisfactory. During the past two or three years the efforts of scientific investigators have been centred upon the addition of hydrogen peroxide—H_2O_2—comprising two parts of oxygen and hydrogen respectively; and, although the bactericidal possibilities of this agent are well known, great difficulty has been experienced in so treating the milk as to prevent evidences of the fact being revealed by the palate. The problem to be solved was, 'What is the minimum quantity of the hydrogen peroxide necessary to produce sterility?' Upon this point there was a wide divergence of opinion, one scientist requiring over 6½ per cent. of the chemical. Milk bearing such a large quantity was undrinkable, owing to the strong metallic flavour it possessed as a result of the addition of the hydrogen peroxide. Another investigator, however, Dr C. Budde, a chemical engineer of Copenhagen, as a result of his careful study of the problem has achieved distinct success, since he can render milk absolutely sterile with such a minute quantity of the H_2O_2 as 0·035 per cent. His process is simplicity itself. The raw milk upon its arrival from the dairy is passed through a special type of centrifugal separator having only one outlet, so that, although the cream and milk are not divided, all suspended impurities are arrested. The milk is then heated to a temperature of one hundred and twenty-two degrees Fahrenheit, and the small volume of the hydrogen peroxide added. The chemical effect is that the hydrogen peroxide is decomposed by the enzyme catalase present in the milk into water, which, being composed of two parts of hydrogen and one part of water, releases one atom of oxygen. This nascent oxygen has extremely powerful bacteria-killing qualities, and it immediately seeks to seize upon another atom of oxygen. The secret of the Budde process is that the inventor has discovered the fact

that the quantity of hydrogen peroxide which the milk can decompose is also just sufficient to effect its sterilisation. Consequently no signs of the milk having been so treated can be detected by the taste. The chemical exercises no deleterious effect upon the subtle and valuable constituents of the milk; and when it is so treated not only is the souring of the article appreciably postponed, but for artificial feeding of infants there is no necessity of first boiling the milk before it is administered as a food, as is requisite with ordinary milk. The process has been subjected to prolonged and searching scientific and bacteriological tests, from which it has emerged with distinct success. It is now being extensively exploited in Scotland, and its value having become appreciated, it is being adopted in other parts of the country.

THE KEARNEY HIGH-SPEED RAILWAY.

Readers of Mr H. G. Wells's sociological volume *Anticipations* will recall the author's insistence that rapid transit is the sole solution of the question of congestion in great centres. Numerous efforts have been made to achieve this end, but it is generally realised that we must look to some system other than the ordinary railway for the purpose. For this reason great interest has been aroused by the new railway system devised by Mr E. W. Chalmers Kearney, which offers an ingenious development in accelerated railway transportation. Recently the inventor demonstrated the features of his invention in London with a working scale-model running upon a track some two hundred feet in length. The idea may be best described as a modification of the well-known mono-rail, with this distinctive difference: in addition to the single-track rail there is a rigid overhead line of lighter construction with which overhead wheels engage, thereby serving to maintain the upright position of the car. The two tracks are held solidly in alignment and gauge by semicircular supports, the ends of which grip the bottom and upper rails respectively, so that one cannot move without the other. The car itself is mounted upon four or eight wheels as desired, the wheels being mounted one behind the other in pairs upon bogie trucks at either end. Each wheel is a driver, since it carries upon its axle and coupled directly thereto an electric motor. By this arrangement the greater part of the weight of the car is near the track, the superstructure containing the passenger accommodation being relatively light, so that the centre of gravity is placed very low, and this factor almost serves to keep the car upright, so that but little pressure is brought to bear upon the guide-rail by the overhead wheels mounted tandem-fashion upon the roof of the car, also at either end. When the car is in motion, owing to the gyroscopic action produced by the traction-wheels, the pressure upon the top rail is practically absent. The secret of the invention lies in the design of the guide-wheels, which are cut very deep and in such a manner that rubbing friction is reduced to the minimum. The advantage of the arrangement is that not only is very high speed attainable—from one hundred miles per hour upwards—but travelling is very smooth and steady. There being only a single rail, lateral swaying is obviated. Moreover, it is perfectly safe, since derailment is impossible unless the permanent way is actually broken. Curves can be easily negotiated at high speed, since it is only necessary to tilt over the guide-rail to give the car an inward leaning to counteract the centrifugal force. Railway construction upon this principle would be appreciably cheapened, since the line could simply follow the contour of the country, thereby avoiding cuttings and embankments, and gradients up to one in three could be successfully traversed.

A HANDY TASSEL-FASTENER FOR BLINDS.

A natty little device which will appeal to the housewife as a means of facilitating a minor but often exasperating task is a fastener that has recently been placed on the market for securing tassels to blinds. There is a small clasp having a cap which opens on a hinge into which the knot at the end of the cord is slipped, and which is merely snapped on to the blind. Consequently, when it is desired to release the tassel, no untying of knots, cutting of cord, or use of tools is necessary, and the tassel and cord can be detached or replaced in a moment.

SALT MANUFACTURE BY FUSION.

For some years past efforts have been made to evolve a more expeditious and cheaper process for the manufacture of salt than the evaporating process which has been in vogue for so many centuries, in which the rock-salt as quarried in the mine, together with its numerous impurities, is dissolved in water and the latter subsequently driven off by means of fire beneath the evaporating pans. The new process may be best described as an application of the Bessemer converter used in the manufacture of steel. The dirty and discoloured rock-salt is discharged into a special furnace, and there quickly converted to a molten condition. Thence it is run into a receiver through which a current of compressed air is forced. This causes all the impurities in the molten mass either to be blown off into the air or precipitated to the bottom of the vessel, leaving an almost transparent liquid. The latter is then poured off into moulds and allowed to cool and solidify, the resultant product being pure and white, suitable for market. The solid block thus obtained can either be sold in this condition as rock-salt or broken up and ground into various sizes as required for different purposes. The most prominent feature of this process is not only the elimination of all impurities, but the fact that the salt is bleached. The extent to which the cost of manufacture is reduced may be gathered from the statement that whereas by the evaporating method a ton of coal will only yield one and a half tons of salt, worth thirty shillings, by the fusion process one ton of fuel will produce fifteen tons of finished salt,

suitable either for the table or commoner purposes, worth two hundred and twenty-five shillings.

ELECTRICITY FROM PEAT.

A comprehensive scheme for the utilisation of peat upon an extensive scale in Ireland is being projected. The scope of the project is to erect a central station upon the Grand Canal some twenty-four miles from Dublin, and to produce blast-furnace gas from the peat which will supply the necessary fuel to huge gas-engines which in turn will drive electric generators of sufficient capacity to furnish electrical energy over King's County and Kildare. The process to be exploited is that of a German inventor, whose extensive factory near Munich has been in successful operation for some two years past. The feature of this process is that peat containing as much as 50 per cent. of moisture can be satisfactorily used, the moisture becoming an essential ingredient of the water-gas, and preventing too rapid combustion. In addition to the production of the gas for the engines, an elaborate plant is installed for the recovery of the residual products, such as sulphate of ammonia, tars and tar-oils, &c., which in themselves are of appreciable commercial value. In the German factory the process is of a dual nature. Peat which can be air-dried to such an extent that only some 25 per cent. of moisture is retained is converted into peat-coke, which from a fuel-point of view is highly satisfactory, and is now used by the German navy and many leading industrial firms, while the raw material from which only about half of the moisture can be evaporated—this operation being dependent upon climatic conditions—is used for the production of the gas from which the by-products are extracted. Owing to the humid character of the Irish climate only gas-fuel will be produced. The process is also to be used in connection with peat-bogs in other parts of the country, and it should offer a means of utilising our vast resources of this raw material to commercial advantage.

THE ECONOMICAL DESTRUCTION OF CHARLOCK AND THE IMPROVEMENT OF CORN CROPS.

There is probably no farmer within the confines of these islands who has not suffered more or less from the infestation of his cereal crops by the yellow weed charlock, which thrives so luxuriantly to the detriment of the corn. Some nine years ago a determined effort was made by the introduction of a simple process to assist the farmer in ridding his land of this ubiquitous nuisance. The method is inexpensive and simple, comprising the spraying of the pest with a 3 per cent. solution of sulphate of copper by a suitable machine that has been designed for the purpose. The fields can be thus treated with equal effect either when the weed is young or in full flower. The cost of treatment, including material, machine, and labour, is not high, averaging about six shillings and sixpence an acre per annum, and in the course of a few years a badly infested field can be completely cleared. The destruction of the charlock naturally improves the quality and yield of the crops, so that the gain secured in this direction more than counterbalances the cost of the treatment. Those farmers, therefore, who suffer heavy losses from the severe infestation of their lands with the nuisance have a ready means of eradicating the weed and restoring the ground to its maximum crop-yielding value. The advantage of the process, moreover, is that no deleterious effect is produced upon the cereals by the sulphate of copper.

PORTLAND CEMENT FROM BLAST-FURNACE SLAG.

The economical and commercial utilisation of the vast quantities of slag which accumulate round our blast-furnaces opens up great opportunities. One of the latest projects for turning this waste to commercial account is the production of Portland cement equal in every respect to the article of this name which is generally employed. The inventor is Mr Sherard Cowper-Coles, the well-known electro-metallurgist, and his process consists in taking the slag in its molten condition as it issues from the furnace to an electric resistance-furnace. Here its temperature is still further raised, during which operation the necessary quantity of chalk is added. The whole mass is then subjected to electrolysis, which brings about certain reactions, the result of which is a cement similar to the best Portland cement. The advantage of the system is the small cost of manufacture as compared with the present methods, while, moreover, it is produced in practically one operation.

THE ORGANISED DESTRUCTION OF VERMIN.

Scientific and medical research having conclusively proved the fact that vermin constitute a menace to the health of the community, and indeed are responsible for the propagation and dissemination of many of the ills to which flesh is heir, an organised movement for systematic eradication thereof should be warmly supported by the general public, who after all are the persons most intimately affected. A few months ago a society under the presidency of Sir James Crichton Browne, F.R.S., was established, upon the broadest lines, for the eradification of rats, mice, sparrows, ticks, fleas, mosquitoes, and flies, to whose ravages a whole range of the most deadly epidemical diseases can be attributed. The society has enlisted the services of our foremost scientists and bacteriologists, and will make a special study of the habits of noxious vermin and the part they play in disease causation, together with experiments with various repressive measures that are from time to time evolved, for the purpose of ascertaining their destructive efficiency. Unfortunately, however, the society, owing to its identification with the efforts of rat-extermination by virus, was regarded by some people as an offshoot of the commercial interests concerned in the exploitation of the various

specifics, some of which have proved far from satisfactory. Such an impression, however, is quite erroneous; but we would urge the society to take a leaf from the procedure of the British Fire Prevention Committee, so that its actions may not be misconstrued or unfair advantage taken by the enterprising advertising agents of the firms concerned. Once this assumption is completely removed, the society—whose offices are No. 1 Palace Gardens Mansions, London, W.—will receive the unstinted support of those to whom it directly appeals, and to whom the extermination of the various nuisances is a matter of vital importance.

FIREPROOF AND DAMP-RESISTING FLOORING.

A new material which should appeal to those desirous of securing not only a damp-proof and fireproof but a perfectly sanitary flooring has recently been introduced to the English market from the Continent, where its utilisation has proved successful. The substance is of a secret nature, having a surface, when laid, similar to linoleum. It is composed of two layers, which together give a total thickness of five-eighths of an inch. The bottom layer is first placed in position, being secured by means of a special paste. This stratum is then also treated with the paste, which acts as a cement, and the upper layer superimposed. Within forty-eight hours it becomes a jointless, solid, and durable flooring. The surface can be coloured according to any required scheme, and it can be easily cleansed. The material has proved eminently suitable for hospitals and similar institutions, though of course it is applicable to any type of building where the above-mentioned requirements are desirable.

A HANDY BATH FOR SMALL COTTAGES.

If there is one drawback more than another incidental to small cottages, it is the absence of a bath. Whether it is considered to be a luxury or is omitted on the plea of expense is not known; but the fact remains that the tenant of cottage property highly prizes any such convenience that is provided for him, and will often sacrifice other comforts in a building in order to secure this accommodation, which in the interests of the general health might very beneficially be made compulsory. An excellent effort to remedy this deficiency is made in the patent tip-up bath. It is made of steel, coated with lead, and painted. Though as light as possible, it is very strong, and just the thing for hard wear such as it would experience in small property. As, however, exigencies of space in a cottage cannot permit a facility of this kind to stand as a permanent rigid structure, the bath is made to tip up when not required, so that it lies flat against the wall, or preferably is concealed in a small cupboard. The bath is so designed that the waste is permanently connected to the drainage system, so that no delay ensues in getting it ready or packing it away when done with. The article is supplied at a low figure, and its popularity is testified by the number of houses in the neighbourhood of Birmingham that have been equipped with it.

ESSENCE OF TEA.

The production of an essence of tea which, while sufficiently concentrated in strength, should still retain its delicacy of flavour has long been an unsolved problem to chemists and manufacturers alike. The extremely volatile nature of those constituents which give to tea its aroma and its inspiriting qualities has hitherto presented an insurmountable obstacle to all experimenters in this direction. But although hitherto unsolved, the problem has not proved insoluble. A firm of Edinburgh manufacturers has at last produced —under the inviting name of 'five o'clock tea essence'—an article in connection with which the difficulties, chemical and mechanical, have been overcome. This result has been the outcome, the manufacturers assure us, of twenty years' experiment and research, and the statement sounds in no way extravagant to any one with a sufficient knowledge of the properties of tea to enable him to estimate the difficulties. To obtain a cup of tea it is only necessary to place a teaspoonful of the essence in a cup and fill up the cup with boiling water. To certain classes, such as early risers, students, picnickers, long-distance travellers by cycle, rail, or motor, nurses and others on night-duty, tea essence will appeal in a very special way; but there is hardly any one who has not felt, at one time or another, the desire to drink or to offer a cup of tea if it could be had without the fuss of tea-leaves and teapots.

LE JARDIN SECRET.

I HAVE a secret garden of my own
  Where none may enter, for I keep the key.
What wondrous seeds therein I oft have sown;
What strange dream-birds have nested there and flown;
What perfect flowers have blossomed there full-blown!
  But not an eye save mine shall ever see
My secret garden where I walk alone.

The orchard-trees are hung with fruits most rare
  Within this garden where I walk alone;
And sometimes on the warm, flower-scented air
One hears the pipes of Pan low fluting there—
A burden soft the dream-bees' hum doth bear—
  Here in this secret garden of my own,
Where, for a little space, I hide from Care.

MARIA STEUART.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE THREE-ARMED BUDDHA.

By T. W. SPEIGHT.

IN SEVEN CHAPTERS.—CHAPTER I.

'BEEN any callers, Baynes?' asked Frank Denaby of the door-porter as he rubbed his boots on the mat in the entrance-hall of Petersham Mansions, situated in the West Central district of London.

'No, sir, nobody has asked for you; but there's a telegram and a post-letter for you in the rack.'

Having secured the documents in question, Denaby ascended by the lift to the second floor. His latchkey admitted him to his small flat, consisting of a general living-room, in which he worked and ate and smoked and received callers, with a bedroom and a bathroom *en suite*.

The clock on the chimneypiece chimed five as he entered. The time was late September, and such wind as there was had an easterly tang in it, so the first thing he did was to strike a match and set light to the ready-laid firing in the grate. Then he drew up an easy-chair and tore open the envelope of the telegram.

'From Brandon, Carlton Hotel,' ran the missive. 'Home from Ceylon a week ago. Shall look you up at 6.30 to-day. Make no engagements for this evening.'

Denaby lay back in his chair and proceeded automatically to twist the telegram into a pipe-light. So his old chum Tom Brandon was back, probably for a holiday, after four years of tea-planting in Ceylon. Well, he should be glad indeed to grip him by the hand. They would have much to talk about and many reminiscences to air. He was glad he had no engagements for the evening; but, had it been otherwise, he would have put off everything in favour of dear old Tom.

Then, presently, he remembered that his post-letter was still unopened. He took it up and scanned the address with some curiosity. The sprawling script was evidently that of an illiterate person—a woman, so far as he could judge. 'Il Signor Denaby,' it ran, 'Petersham Mansions, Londra.'

After ascertaining that it bore no post-mark save a London one, he opened the envelope and extracted the enclosure, the contents of which were in Italian, and, translated, ran as under:

'SIGNOR,—I write this to warn you that your life is in great danger. Signor, you can hardly have forgotten Ruffo Rupini; but, if so, he has not forgotten you. That day at Naples, before he was put away five years ago, he swore vengeance against you. He is again a free man and here in London.

'Signor, the fire of his hate burns as fiercely to-day as it did then. By chance he has discovered where you live. Last night he cursed you in his sleep. This morning he sharpened his *coltello*. To-night he will leave home when the dark sets in. I pray to the Virgin, signor, that nothing may happen to you before morning. But I tremble—I tremble. Oh, beware!

'May the Holy Saints have you in their keeping, signor! TERESA.'

The pleasant smile which had lighted up Denaby's face at the reading of his friend's telegram died out of it as he took in the contents of the letter. Then he read it again, more slowly than before. That done, he lay back in his chair and began to go over in memory the circumstances in connection with the affair of Ruffo Rupini. But he had not been thus engaged more than a couple of minutes when, after a discreet tap, the door was opened by Baynes.

'A gentleman to see you, sir,' he announced; and hardly had the words left his lips before Mr Tom Brandon brushed past him into the room.

Denaby sprang to his feet, dropping the letter as he did so, and the hands of the two men met in a long, warm grip. When the first greetings were over, Brandon said, 'I am here before the time named in my telegram. I had a business

 [*All Rights Reserved.*]

appointment in the City, and was able to get away earlier than I expected.'

As soon as they were seated, one on either side of the hearth, Frank said, 'Are you over in England for any length of time?'

'Three months is the limit of my leave. But I mean to have a rippin' time while it lasts. And now tell me, dear old chappie, how the world has been using you since we parted last?'

'Quite as well as I had any right to expect it would. After my father's death and the wreck of our family fortunes, being an adept at shorthand and having published a sketchy book of travels, I was glad to accept the offer of a berth as a sort of general-utility man on the staff of *The Pharos*, a paper of the existence of which I hope you won't plead ignorance. Since then I've progressed somewhat. When the House is sitting I haunt the Gallery as an extra hand in case of emergencies. I attend such *premieres* as our theatrical boss thinks beneath his notice, and write the needful critiques. Now and then I run down into the country to report a political meeting. For the rest, I review such books of all sorts as Anstruther, our literary gun, turns up his nose at.'

'And it's a life that suits you?'

'I'm satisfied, and when I've said that I've said enough.'

Thereupon he rose, crossed to the sideboard, and brought out of it a box of cigars, a spirit-stand, and a siphon of aerated water. 'Help yourself,' he said, as he drew up a small table and placed the articles on it. Then each took a cigar, and for a couple of minutes silence reigned.

'You seem to have a comfortable little shanty here,' remarked Brandon presently, as he glanced about him.

'The accommodation is rather limited, but the position suits me; besides, I can't afford anything more expensive.'

Several good engravings on the walls, some Nankin and cloisonné ware, three or four Persian rugs on the floor, a couple of tables and sundry chairs, a serviceable writing-desk (littered with books and papers) under one of the windows, with a typewriting machine under the other, pretty well made up the room's plenishing. It looked like what it was, the home of a worker; but Brandon could not help calling to mind how different it was from the luxurious flat rented by his friend before the family *debâcle*.

Suddenly his gaze became concentrated on a bronze statuette of Buddha, about fourteen inches in height, which stood on the chimney-piece. At once he rose in order to examine it more closely. 'We have no end of these johnnies, with their curly locks, in Ceylon,' he said as he turned it over. 'But I don't remember ever seeing one before with three arms.'

'That constitutes its rarity, I opine. At any rate, I paid fifty guineas for it at a curio sale a few days ago.'

Brandon gave vent to a low whistle.

'Not for myself, mind you, but for my uncle Sir Frederick,' continued Frank. 'He has a mania for collecting Eastern curiosities of any and every kind, and no end of catalogues of forthcoming sales are addressed to him. But the dear old boy's a martyr to gout, and in the course of the last year or two I have attended a number of auctions as his representative. That's how this three-armed monstrosity came into my temporary keeping. It was marked in the catalogue, "Genuine Antique—Very Curious." That was enough for Sir Frederick, and I was instructed to buy it. Next week I shall attend another sale for him, after which this bronze and certain other purchases will be packed up and forwarded to him at Winterslade Park.'

'Every one to his taste; but, for my part, I shouldn't care to have this inane face staring at me night and day in my bungalow. I suppose that in Burma or Ceylon the fact of his being represented with three arms instead of two would cause his worshippers to hold him in especial reverence.'

'Possibly so, just as here in the West the same fact adds to his monetary value.'

When Denaby rose to his feet, at his friend's entrance, the letter in Italian had fluttered to the floor, and lay there unnoticed. Now, however, it caught his attention, and he picked it up, his face darkening as he did so. After a moment's hesitation, he handed it to Brandon, with the remark, 'Here's a precious effusion which reached me by post an hour or two ago. Read it.'

'In a woman's writing, is it not?' was Tom's first question.

'Yes.'

'And in Italian?'

'Yes.'

'Then take it back, old man. I know about six words of Italian and no more. But what's it all about?'

'I will translate it for you as literally as I can;' which, after he had switched on the electric light and drawn the window curtains, he proceeded to do.

Tom stared at his friend, when the latter had finished, with an expression of puzzled amazement. Then he said, 'What a funny rigmarole!—for of course it's only a rigmarole. There's nothing serious behind it, is there?'

'It depends upon what you mean by nothing serious,' replied Frank dryly. 'That Ruffo Rupini, at whatsoever risk to himself, will do his utmost to fulfil his oath, I do not doubt.'

'Good heavens! you don't mean it! And to-night, too! But who is the writer of the letter?'

'His wife.'

'Thunder! Now you've told me so much, you must tell me all.'

'That's what I'm about to do. Take another weed, then listen, and ask no questions till I've done.'

He refolded the letter and waited till Brandon had struck a match.

'Between five and six years ago I found myself in Naples for the first time,' began Frank. 'The many-coloured life of that gayest of cities fascinated me, and I lingered on longer than I had intended. One evening, in a deserted part of the suburbs—there was some *festa* or other, I remember, in full swing elsewhere—a man of the labouring class who was walking a few yards ahead of me was pounced upon by another man who sprang from out an archway where he had been lying in wait. There was the momentary flash of a knife, which two seconds later was buried between the shoulders of the first man, who flung up his arms, gave one cry, and sank to the ground. As I rushed forward the murderer turned to fly and we collided. For an instant he glared at me with bared teeth and protruding eyeballs; the next he was gone. But in that instant I had been enabled to note certain physical peculiarities, and it was owing to my description that the police were successful in tracking and capturing him, and it was my evidence at his trial which served to convict him. Then it was, as he stood in the dock, that he launched at me his oath to be avenged as soon as he should regain his liberty, for extenuating circumstances had been advanced in his favour, and he was merely sentenced to a few years' imprisonment. And now you know Ruffo Rupini's purpose in tracking me down.'

'A pretty sort of scoundrel, and no mistake! But what I fail to understand is why his wife, of all persons in the world, should be the one to warn you of your danger.'

'With her gratitude seems as powerful a motive as revenge in her husband's case. After Rupini was sentenced I caused certain inquiries to be made respecting his wife and family, and finding that they were on the verge of starvation, I made arrangements with an *avvocato* that the wife should be paid a certain sum per week during her husband's enforced absence. But I'm at a loss to imagine how she discovered my connection with the allowance.'

'It's a queer business, and I'm glad that I'm not mixed up in it. But as regards the warning in the letter, what action do you purpose taking?'

'None at all.'

'The police'——

'Would be puzzled to run down Rupini among London's millions even if I had a definite charge to make against the fellow, which I have not. No, I must just take my chance, and'——

'What a dunderhead I am!' broke in Brandon, with a resounding slap on his leg. 'Till this moment I had clean forgotten that I'm the bearer of a special invitation for you from my aunt, Mrs Lennox—surely you can't have forgotten her! Her only son comes of age to-day, and to-night she gives a ball, to which I'm going, and you with me.' He glanced at his watch. 'Jack Ponsonby's motor-car will call here in thirty minutes from now, and it won't take us longer than an hour to spin down to Minden Lodge; so you've just time to get into your evening togs. Should Signor Rupini favour you with a call to-night he won't find you at home.'

'Of course I've not forgotten Mrs Lennox,' said Frank, 'and I'm obliged to her for her kind invitation; but from the day circumstances made it needful for me to earn my bread-and-cheese I resolved to renounce the pomps and vanities—so to term them—to which I was addicted in the days when Fortune smiled upon me. I've exchanged the West End for Fleet Street, and whether I have cut my swell friends or they have cut me makes no difference so long as the result is the same.'

'The rule you've laid down for yourself may be all very well in a general way; but every rule has its exceptions, and I hold my aunt's invitation to be one of them. In point of fact, old man, I shall take your refusal as a personal slight. I may remark that a certain young woman with whom you used to seem on excellent terms is just now visiting at Minden Lodge.'

'To whom do you refer?'

'To my aunt's special pet, Elsie Deighton.'

Denaby bent forward and began to poke the fire in order that Brandon might not note the sudden flush that had mounted to his face.

'Yes,' he said with a fine assumption of indifference, 'once on a time Miss Deighton and I used to be very good friends.'

'She's just as charming now as she was then; more so, to my thinking. And didn't her eyes sparkle when I pledged my word to my aunt that they should see you at the ball!'

Before more could be said Baynes entered and announced that a motor-car was waiting at the door for Mr Brandon.

'All right,' replied Tom. 'Tell the chauffeur that I shall be down in the course of a few minutes.' Then, turning to Denaby, he said, 'Hurry up, there's a good fellow, and jump into your togs.'

Twenty minutes later the motor-car containing our two friends started on its journey to Minden Lodge, thirty miles away. Frank's last words to Baynes were, 'I sha'n't be back before morning.'

On the chimneypiece upstairs the three-armed Buddha was left staring into vacancy with expressionless eyes.

(To be continued.)

NEW JOURNALISM.

By Henry W. Lucy.

THE founder of New Journalism in this country is not among the group of journalists who to-day profitably carry on the business. It was Mr Frederick Greenwood, who in conjunction with the late George Smith founded and solely edited the original *Pall Mall Gazette*. When that luminary appeared in the journalistic firmament, British newspapers sedately, not to say ponderously, followed on the lines established in early Victorian days. There were three leaders of equal length, each divided into three paragraphs, the middle being a little longer than either of the others. Had that condition not been fulfilled no morning paper would have continued to respect itself. Every London paper had its resident correspondent at Paris, and some—the *Times*, for example—went farther afield among the capitals of Europe. But telegraphic news was scanty, and the Atlantic cable as yet was not. Everything was lengthy—the parliamentary reports unrelieved by touch of description of the scene amid which they were carried on, law reports, articles on abstruse subjects, and letters to the editor. To open a newspaper was to present to the eye a level pl in of print. There were no big type cross-headings, occasionally conveying more news than is to be found in the columns they adorn. Paragraphs were eyed askance by editor and sub-editor as something too trivial for the dignity of journalism. A good unbroken column—three, if matter would run to it—was the thing.

When Mr Frederick Greenwood planned the old *Pall Mall Gazette* he went straight to the heart of the principle, obedience to which, perhaps in exaggerated form, has been the basis of the success of New Journalism. He cut things short. He did not absolutely abolish the leading article, but one sufficed. In its arrangement he laid ruthless hands on the sacred principle of the three nicely balanced divisions. His leading article was broken up into paragraphs according to turns in the argument under illustration. No man sitting down to write a letter to a friend thinks of framing it in three divisions. Why so treat a leading article, which, after all, is a communication from a man with a pen in his hand addressing a multitude? Next he introduced the Occasional Note, whose price is above rubies. Under the old order of things, a man having, say, threepennyworth of idea felt compelled to beat it out through three paragraphs, the aggregate just exceeding a column of leader type. With the Occasional Note there was no incentive to unduly spinning out the thread of thought. On the contrary, the briefer the better for the point to be made. Another audacious innovation which shortened the lives of some aged printers' readers was the size and formation of the sheet. Save in respect of the *Times*, which charged threepence a number and had to live up to the price, London newspapers of forty years ago consisted of eight pages of unwieldy size. The *Pall Mall* came out a trim and handy sort of enlarged pamphlet.

It is melancholy to reflect that, having these material advantages, supplemented by a literary staff whose brilliance shone like a star amid the vapidity of hack journalism, the success of the *Pall Mall Gazette* was, in the first instance, due to a flash of that sort of Journalism we still call New. It was not the writing of Frederick Greenwood, FitzJames Stephen, or other of the scholars and gentlemen meeting in the dingy room in Northumberland Street that caught on with the public. It was a stray article of what is known as the sensational order, contributed by an outsider who had the temerity to pass a night in the casual ward and the gift of graphic description.

It was in the service of the *Pall Mall Gazette*, under the editorship of Mr Greenwood, that I first entered the Press Gallery of the House of Commons. In those far-off times—it was the year 1870—the Gallery was in all respects a different place from the institution as it now exists. It was an exceedingly close corporation, only the London morning papers being represented by regular staffs. The consequence was there were boxes sufficient for all duly qualified applicants. Indeed, two were appropriated to each paper—one for the staff, the other for the summary-writer. The benches at the back, now nightly fought for through the session by descriptive summary-writers, London Letter purveyors, and the occasional leader-writer, were then an empty space on which Steel, sole janitor of the Gallery, not always noiselessly slept. The aggregate number of reporters did not exceed threescore. Even for that number the accommodation for their comfort outside the Gallery was ludicrously inadequate. They were 'strangers' whose presence was winked at in spite of the retention among the Standing Orders of an edict prohibiting publication of report of debates under heavy pains and penalties. If they were wise they would take such goods as the Serjeant-at-Arms provided, and, forestalling the custom of Brer Rabbit yet unborn, 'lay low and say nuffin'.'

In this twentieth century there are provided for the convenience of the more than two hundred gentlemen who have access to the Press Gallery suites of spacious rooms in which notes may be written out, in some with the comforting assistance of the homely pipe or the lordly cigar. There are dining-rooms, smoking-rooms, tea-rooms, and an excellent library of reference. Less than forty

years ago meals, such as they were, were served in a little vestibule at the top of the stairs leading to the Press Gallery. Here in later years sat old Wright, who, in intervals of wakefulness, talked with the telegraph messenger-boys in conversational style more nearly akin to that of Dr Johnson than anything a nineteenth-century generation was privileged to enjoy. Wright, a character in whom Charles Dickens would have delighted, was a brand plucked from the burning by Lord Charles Russell when Serjeant-at-Arms. He was in early life brought up to the boat-building business somewhere on the banks of the Thames. The tradition in the Gallery was that the Serjeant-at-Arms, strolling at ease by the river's marge, heard him praying or singing a hymn (I forget which), entered into conversation, and was so impressed with his intelligence and simplicity of manner that he appointed him guardian of the outer approach to the Press Gallery.

In course of time Wright, perceiving an opening for business, furtively brought down in a red pocket-handkerchief (not, it was faintly hoped, earlier devoted to its appointed purpose) a chunk of boiled beef. This, engagingly displayed with plates and knives and forks on the table, attracted hungry gentlemen of the press accustomed to go outside in search of supper. Encouraged by growing custom, Wright supplemented the boiled beef with the knuckle-end of a ham. There he stopped. It was ever cold roast-beef and boiled ham. When the sybarite got tired of beef and ham he had ham and beef. I suppose it was due to handling knives and saws and things in the boat-building business that Wright developed a skill for cutting slices of ham and beef thinner than ever before were laid on the plate. That was a pardonable mannerism. What the fastidious found objectionable was that, whilst engaged upon the delicate operation, he brought his nose into undesirably close contiguity with the joint he carved.

When I began my work in the Press Gallery all the morning papers had a parliamentary summary, and all were modelled on the style of the column in the *Times*. It was then, as it remains to this day, a severely sedate, shorter report of speeches made in the course of the sitting. Since the start of the paper, the *Pall Mall* summary had been written by the assistant editor, Mr Hamilton Fyfe. An old Gallery man on the *Times* staff, he in this particular department of the new paper brought with him the *Times* style. The 'prentice-hand of Mr Fyfe's immediate successor did not venture to stray beyond the iron-bound limits. The understanding was that a summary-writer sat in the Press Gallery to hear, not to see. The slightest departure from that rule would have shocked the editorial mind and might have led to unpleasant consequences for the hardy adventurer.

It was on the morning edition of the *Pall Mall* I fleshed my maiden pen as a recorder of parliamentary events. The venture, a costly one for the princely proprietor, did not long survive my collaboration. In the autumn of 1872 I joined the staff of the *Daily News*, and in conjunction with Archibald Forbes took a step regarded at the time as something tending in the direction of New Journalism. Whenever an event of public importance took place—a wreck off Dungeness, unrest among the miners of South Wales, an agricultural strike in Warwickshire, a balloon ascent, a picturesque trial, certainly in one case an execution at Newgate—we attended, wrote more or less picturesque descriptions, and, if the event took place in the provinces, telegraphed it in time for the next morning's issue.

In 1873, there chancing to be on the *Daily News* staff a vacancy for the post of leader of the parliamentary corps and summary-writer, I was appointed to fill it. In the following year there were born a new Parliament and a new era in parliamentary procedure. Under the leadership of Isaac Butt, the Irish Nationalist party first became a coherent force. After brief struggle, Isaac Butt's inherent constitutional prejudices proving a block to his supremacy, he was pushed aside. Parnell came to the front, with grotesque but shrewd Joseph Gillis Biggar as his lieutenant. Disraeli was leader of the house. Gladstone, after for a while uneasily wearing the chains of voluntary quietude, blazed forth in denunciation of the Bulgarian atrocities. There were alarums and excursions in which Kenealy and Plimsoll played divers parts. There were all-night sittings, heated debates on foreign policy, and one tragic episode when opposition to a vote of credit led by Forster from the Front Opposition Bench was hurriedly withdrawn after Stafford Northcote read a telegram just arrived from Layard, Her Majesty's Minister at the Porte, announcing that the Russians were at the gates of Constantinople.

How were these incidents and scenes to be realised in the minds of the newspaper readers through the medium of the old-fashioned, still orthodox, summary? With trembling hand, a dash of colour was splashed upon the parliamentary summary of the *Daily News*. Attempt was made to invest the column with some of the light that nightly blazed in the House of Commons. The editor was not shocked. The public seemed to like it. It speedily became, and for thirty years remained, a recognised feature of the paper.

Another revolution tending towards New Journalism for which the *Daily News* is directly responsible is the collection and prominent publication of paragraphs of more or less exclusive political information. When I first knew the Press Gallery, the Lobby of the House of Commons was, to its occupants, as distant, certainly as unfrequented, as the Desert of Sahara. One or two of the more enterprising of the provincial papers supplied in their London Letters occasional gossip from the parliamentary arena. No well-regulated London morning paper would display in its columns small

wares of that kind. It was during the Parliament of 1880–85 that stray paragraphs conveying political information derived from private sources began to appear at the foot of the leaders in the *Daily News*.

My earliest efforts in this new field were hampered by telegrams coming down from the editor's room, over the private wire, asking for authority for particular statements. The credit of a great newspaper was a precious thing not to be endangered by what might have no sounder foundation than what Disraeli on a historic occasion, alluding to reports of Turkish evil-doings in Bulgaria, described as 'coffee-house babble.' When it turned out that some of the allegations were verified, some of the prognostications fulfilled, these paragraphs were eagerly welcomed in Bouverie Street, and appropriated with engaging freedom by the evening papers. One by one the other London morning papers followed the lead in this direction of the *Daily News*. Last of all the *Times* came also with its admirable column of Political Notes daily published through the parliamentary session. In respect of this phase of New Journalism, as in the matter of the descriptive summary of a night's doings in Parliament, all can grow the flower now, for all have got the seed.

Notice of one other small matter completes confession of personal complicity in the birth and growth of New Journalism. When, in the course of time, I came to the editorial chair of my *alma mater*, the *Daily News*, in common with its contemporaries, observed the custom of printing leaders without a heading indicating their purport. It is difficult to conceive any practice more indefensible. It was part of the Brahmin reverence with which utterances of the editorial 'we' were regarded. The provincial daily papers, less trammelled by ancient customs, frankly introduced their leading articles with an allusive or explanatory cross-heading. I was myself so far under the spell of unreasoned prejudice that I stopped short of that innovation on metropolitan practice. I compromised by introduction of the indented heading, to-day familiar in nearly every newspaper published morning or evening throughout the country. In the dead unhappy night, when the rain is on the roof, I tell myself in mournful numbers that had it been possible to patent the little device, charging a royalty, say of a tenth of a penny per leader page, I should to-day be one of 'them as is rich and rides in chaises.'

The exponents of New Journalism, the sale of whose products leaves the elder journals lamentably lagging behind, have, whilst embodying the principle of brevity that marked the old *Pall Mall*, introduced other features. Our most widely circulated halfpenny morning papers are, in brief, the result of grafting American Journalism on a British stem. Perhaps there is not much of the stem visible. The motto of New Journalism may be read by slight variation of a familiar line: 'Be smart, my child, and let who will be accurate.' The inherent weakness of New Journalism is its slavery to sensationalism. It must have with every fresh morning big headlines calculated to make its readers 'sit up,' whether at the breakfast-table, in tram, or railway carriage on their way to business. There is no implacable reason why the column of smaller type that follows should live up to the headline. Still, folk who have planked down their halfpenny want something in return. A newspaper reader cannot live by headlines alone. The weakness of the situation is that every day does not bring its sensation. Consequently a spirit of inventiveness is called in aid, and imagination rushes in where facts fail to tread.

This is a pity, as, though an occasional flash such as an imaginary massacre in a far-off capital, or a frenzied outbreak of a colonial premier by fond fancy feigned, may be overlooked, a continuance of putting forth fables as facts is apt to create a feeling of mistrust in the mind of the most generous public. If New Journalism were as reliable as it is readable it would be a mighty power in the land.

As it is, it has revolutionised the British press, not only by its abnormal circulation but by its influence upon the older class of newspapers. They all denounce its ways and timidly imitate some of them. In such a contest the race is not to the timid, and New Journalism, fearlessly going the whole hog, leads by many laps.

A PAWN IN THE GAME.

By W. H. FITCHETT, LL.D., Author of *Deeds that Won the Empire*, *How England Saved Europe*, &c.

CHAPTER XXXVIII.—IN THE BRITISH CAMP.

JACK was welcomed at the mess—such as it was—of the Tenth, and the change from a Bedouin camp-fire to the table of a British mess was bewildering. He sat amongst the officers of the Tenth like a man in a dream. Their talk sounded in his ears like an unknown language; he had lost the key to it. But the officers were on active duty, and, as is always the case under such conditions, were in high spirits, and their welcome to Jack had a delightful element of frankness in it. He had been rigged out in European dress at the expense of the wardrobes of half-a-dozen officers, and as he sat with his sunburnt features at the improvised mess-table he was a very striking figure. He had much to tell which

keenly interested his hearers. He knew the desert through which they had to struggle, with its risks and hardships, its perils of thirst, of heat, of attack from roving bands; and he had a hundred stories of wild incidents and strange experiences to relate.

But the question of his own future was already perplexing him. The sight of English faces, the sound of English voices and laughter round the mess-table, seemed to bring his old life back to him at a breath. The oasis set in the flaming sun, the dark countenances of the Bedouins, all the bitter memories of his slavery faded. He touched civilisation again. London was calling to him, and the faces London held. He stretched out his hand in the empty air involuntarily, as though to grasp unseen and far-off hands. What might not have happened in his own household circle during all those years? Did love still wait for him there? Did they mourn for him as dead?

Then there swept through him a wave of thankfulness that sent the water to his eyes. The suddenness and completeness of his escape amazed him. He had imagined himself reaching some little coastal village and seizing a boat and daring the risks of the sea, or stumbling perhaps on some French outpost and surrendering himself as a prisoner of war. He never imagined safety could be won except through some long procession of perils. And, lo! it had come in a breath, and in the shape of a whole British army, with its guns. Often when a slave in a camp of Bedouins, in the sleepless hours of the night or in the thirst and heat of a desert march, he had, in the language of the psalm, 'lifted his eyes to the hills' from whence help alone could come. And help *had* come—complete, final.

The major, who sat at the head of the mess-table, noticed the mood of abstracted silence into which their guest fell, and when the little gathering broke up he detained him for a few minutes and talked of his future plans.

'You must see the General,' he said at last; 'he is coming up from the port to-night, and goes on to Legeta to-morrow. He will settle things for you.'

The tone of confidence in which the major spoke amused Jack.

'The whole mess plainly believes in the General.'

'So does every man in the camp. The Sepoys make religious offerings to him. Your shortest and safest road to London,' the major went on, 'is with us. We shall strike the Nile and sail down it, or march along its banks to Cairo, and join hands with the British troops there. You can easily make your way from that point down to the Mediterranean.'

Jack did not reply, but he felt that this plan was hardly good enough. The pace of the army would be an irritation to him. The column crept on, with its huge 'tail' of camels and supplies, the men halting through the flaming midday and the long afternoon. His camel would leave the heavy-footed battalions hopelessly behind. If there was no other course possible he must push on alone.

That night, as he lay half-asleep, Jack heard, running like a thread of sound through his dreams, the trampling of horses, the clash of steel; and when he awoke he was told that the General and his staff had arrived, and had pushed on, without halting, to the next stopping-place. Long before dawn, while the sky still glittered with the light of a thousand stars, the column had broken camp and was on the march. Jack rode for a couple of hours beside the major of the Tenth, and then put his camel to the trot and pushed on ahead with Sidi to Legeta, to overtake the General. He reached the halting-place before noon, and early in the evening obtained an interview with Baird.

The British General was a figure to satisfy the eye of a soldier. In stature he overtopped every man in his own force; and the vast limbs, the massive features, the full, open eyes—with a sort of slow majesty in them—made him an ideal soldier of the medieval type. He resembled an Ajax Telamon in the uniform of a British major-general. Whether he had the forecasting brain of a great soldier might perhaps be open to doubt. The forehead, falling in from the wide brows too quickly, hardly suggested intellect of the highest order. But if he had lived in an age when war was a matter of personal combat, Baird's commanding stature and physical strength would have made him famous. He might have ridden, armed cap-à-pie, with Richard Lion-Heart; and there was a knightly strain in the Scotch soldier's temper as well as a knightly look on his face which made him fit for a place at the round table of King Arthur himself. After the guttural of Arab camps, too, Jack found Baird's broad-vowelled Scottish speech, through which the consonants ran like a thread of gravel, very pleasant to his ears.

Baird listened to his story with silent attention. He pricked up his ears when Jack told the tale of his long slavery, and questioned him closely as to the life he had lived in the oasis and the term of his captivity.

'Well,' he said, 'I spent as long in an Indian dungeon;' and he looked at Jack with a friendly air. He had himself been a captive for three years and eight months in Seringapatam, and the common experience gave him a sense of comradeship with his visitor. 'Your Bedouins,' Baird went on, 'might have taken lessons in cruelty from Hyder Ali.'

'But you had company, sir. I had no Lucas with me.'

The story of Baird's long captivity was a household tale throughout Great Britain, and the chivalry of Lucas, a fellow-officer of Baird, was almost as famous and quite as noble as the story of Bayard and the dying soldier. His captors were about to fasten a pair of heavy iron fetters on Baird's wounded limbs, and Lucas volunteered to bear two sets of

irons himself in order to save his comrade. Baird's eyes softened at the name.

'Ay,' he said, 'he died, poor fellow! in that devil's hole.'

Baird meditated a few moments after listening to Jack's story.

'I will give you all the help I can. You are eager to reach London, and the column will be too slow for you. But I am sending my aide-de-camp Budgeon in advance, with despatches to General Hutchinson. He must travel fast, but I don't think,' he added, looking at Jack's active figure and sun-browned features, 'that you will hinder him. You may, indeed, be a help to him, and the two of you shall ride together.'

Budgeon was called in. He was a little, short-legged, short-necked, square-headed officer, an infantry man, having a commission in the Eighty-fourth. Baird had chosen his messenger with a shrewd eye, for Budgeon was a light-weight, a soldier every inch, and his little, compact body was as hard as nails. He looked askance at Jack as soon as he heard they were to be companions. He meant to push on at speed and at any cost. This newly escaped slave was not a soldier; at best he would be an unknown factor in the enterprise in hand, and he might well be a drag upon it. But Budgeon took a fresh look at his proposed companion, and something in his build and look reassured him.

'You will do,' he said briefly.

But Jack found that he must part with Sidi. Budgeon bluntly refused to have him in the party.

'You need not come yourself,' he said ungraciously, 'if you do not want to come; but we cannot take the negro with us.'

There was no difficulty in finding a place for Sidi in the force; he was gladly taken on by the quartermaster of the Tenth. But it was hard to break a companionship cemented by so many perils and sufferings. Jack found it hard indeed to make Sidi understand why they must part, and the huge negro flung himself down on the sand, weeping like a child, when he heard the news. Jack felt his own eyes grow wet at the parting.

'I shall come back to Egypt,' he said, 'some day, and pick you up again;' and at the words Sidi lifted his face with a half-consoled look. Jack had arranged for an advance from the paymaster of the Tenth, and he poured into Sidi's broad black palm a glittering stream of gold. But the tears were running down the negro's face as Jack rode away, and the gold coins were slipping through his unheeding fingers.

The pair rode off from the camp as soon as night fell, and pushed on all night. The next day they struck the Nile at Ghennah. They had to find their way down more than three hundred miles of its course to Cairo. The river was already beginning to rise, the monsoon had set in, and if the current was in favour of the boat the wind was against it.

'The General,' said Budgeon as he looked meditatively on the river, and noted the lines of foam caused by the rush of the current against the wind, 'will have a hard job when he gets his troops afloat.'

Ghennah was a little patch of verdure set in the brown of the desert sands, with the river running past one face of it. It was rich in fruit-trees, in gardens, and melon-beds, in leaf and shade of every kind; and to the eyes of Jack, dulled by the glare of the white light and the brown and gray of desert sands for so many months, the green of the little river-side oasis was a perpetual feast in colour. But no suitable boat was to be had, and the pair mounted their camels and pushed on to the next stage.

For the next three days the pace was kept up. Sometimes they picked up a boat at a river-side village, manned it with a strong crew, and pulled through the glaring day. Then they landed, secured fresh mounts, and rode on. Nothing tired Budgeon, yet he would have fared badly but for his companion's knowledge not only of Arabic but of Arab character; and as the English soldier toiled on in the heat, his face crimson, his eyes almost apoplectic, he found that Lawrence could outride and outlast him.

On the morning of the fifth day three spear-points of deepest azure drawn with the sharpness of steel against the luminous sky were visible. They were the tips of the Pyramids. Later in the day, while the gray walls of Cairo were still out of sight, they struck a picket of British cavalry. The officer drew up his horse and stared with astonishment at the pair.

'Why, Budgeon,' he said, 'where have you dropped from?'

The two men clasped hands. He was Gray of the Royals, Budgeon explained, and they were old friends. Jack sat silent while the eager rush of question and answer betwixt the two went on.

'And the troops from India are behind you!' said the cavalry officer at last. 'That's a big thing and a plucky thing;' and he looked admiringly at Baird's messenger.

Then he told the great news. The French in Cairo had surrendered; the city was to be given up the next day.

Budgeon's face fell as he listened. 'Then we poor fellows from India are too late after all;' and the expression of disgust on his red features threw the cavalryman into a fit of laughter.

'We are too late.' That is the history of Baird's famous expedition packed into a phrase. It was daring in conception, singularly picturesque in its details, admirably led—Baird lost only three men in the march from Kosseir to the Nile—and yet it was a failure. It was whipped with storms across the Indian Ocean. It arrived at its destination a fleet with its Admiral missing, a General without his army. It struggled across the desert tormented by thirst, scorched by heat. It found its way for three hundred miles down the Nile to Cairo. And yet, during its whole course, it never saw a shot fired in battle!

The dates in the almanac register its failure. The desert march began on June 29; and Cairo had surrendered on June 28. Baird with his army arrived at Gizeh on August 8, only to find that General Hutchinson had left for Alexandria the day before. Baird followed, reached Rosetta on August 30, and learned that the French holding Alexandria had sent in a flag of truce on August 29!

(To be continued.)

GLENFINNAN.

AN April day, with a cold north wind—a day when the views are exquisitely clear and far-reaching, and when the hills stand out sharp and blue, their snowy tops so like the white clouds which chase each other across the blue sky and cast deep shadows on the mountain-sides. An April day, and one true to the somewhat fickle nature of that month. From time to time a shower of sleet or hail sweeps through the glen, enveloping everything in mist; yet the curtain is down only for a few minutes, and when it lifts the scene is even brighter than before, though round a far-off precipice a thin wreath of mist is left lingering like some hill-spirit, soon to vanish in the gay sunlight.

Up on the hillsides the wind is icy; but here, in the shelter of the glen, it is summer, and one lies lazily drinking the heather-ale and becoming more and more intoxicated with its glory.

Within a few feet of where I lie, thus employed, is a huge bell suspended between two stones. No one I have asked can tell me its history, yet I cannot but think that it may have some tale to tell, for all this ground is hallowed by the memories of 'old, unhappy far-off days.' At one time it has come from Ireland, to judge by the inscription, 'Erin go bragh.' Now, I suppose, it does duty for the little Roman Catholic chapel beside which it stands.

The builders of old days chose beautiful situations for their churches and monasteries, and their descendants have been true to the traditions as regards this chapel. Behind and on both sides, stretching a short way up the mountains, are woods, where the fresh green of the larches and the white stems of the birches—surely the most graceful of trees, even when their brown, feathery branches are bare—show up in vivid contrast to the dark-blue-green foliage and copper barks of those grand old chieftains of the forest, the Scotch firs. Down in the grass the primroses and anemones clamber luxuriantly over the banks, a wonderful size in this warm corner in the midst of the northern hills, and numberless tiny flowers peep shyly from beneath the tangled undergrowth. The birds, too, are making merry, and the air is filled with the spring songs of blackbird and thrush, while away up in the sky the larks are lilting with wild joyousness.

Above the woods the hillsides are grim and bare, brown heather and copper bracken, red-stemmed bog-myrtle, green moss and gray rock, all the gorgeous colouring of the Highlands, up and up to the glistening snow. Below, the loch lies sparkling in the sunlight, the shadow of its giant guardians reflected in its calm waters. A short distance from the shore is the little island of Eilen-finnan, where once stood a church, ancestor of the chapel on the hillside. Tradition says this church was one of seven built by a robber chief of the Camerons—a personage evidently anxious to make his peace with Heaven!—and that not so very long ago pilgrimages were made to the island by those who needed to propitiate the Powers above.

But the ruins of the robber's church have not the greatest claim to interest in this glen. At the head of the loch stands a tall pillar surmounted by a kilted figure, and to that figure the glen and all the country round owe not a little of their glamour and charm—to the 'yellow-haired laddie' who lit a flame of romance here which has not died out yet, and which it is to be hoped never will. What did he think of Glenfinnan, I wonder, as he was rowed up the loch yonder, or waited impatiently for the coming of the clans? Did he feel thrilled with its wild beauty, and with the knowledge that it was for a country such as this he was fighting? It must have looked then very much as it does to-day. Those magnificent Scotch firs on the knolls and round the bend of the road could tell a tale worth hearing if only they could speak.

Surely, if ever there are ghosts, here is the place for them—here, where the shadow of the gallant old cause hangs over every inch of ground. Perhaps at night, when the moon-mist gathers by the water-side, a ghostly Tearlach, with shadowy followers, raises the standard once more, and the phantom pipes skirl a triumphant pibroch. Or else on wild days, when the storm sweeps down the glen, and the mist clings to the hills, hiding everything from human eye, and the winds sing a coronach for his lost hopes, then Royal Charlie comes back to his own, and passes by, ragged and hunted, but gay and debonair, laughing and singing as of old.

After Culloden the Prince was back on the shores of Loch Sheil. An old manuscript which I have seen gives the story of one of his adventures thus: 'The Argyle Militia patrolled all round the loch, and broke all the boats for fear of his escaping and crossing the loch. In this emergency, his followers felled a large oak, and hollowed it with axes and fire, and at midnight put the poor Prince prostrate in it, and swam across the loch with the

rude boat tied to them. They could not row for fear of being heard.'

Very bitter must the contrast have been during these wanderings to the early days in Glenfinnan. Yet, was not the devotion he inspired worth more than the crown for which he fought? As a writer of the most delightful Highland stories has said: 'Was it not in victory he passed, conquering human hearts in which he will reign for ever, crowned with a love that will never fade?'

THE TOUÂREG.

By Sir Alexander Muir Mackenzie, Bart.

I VISITED Algeria first in 1866–67, and again about 1876, then returning each winter for ten years. During my first visit the development of the colony was the theme of soldiers and civilians alike. The French had been in possession of Northern Algeria since the conquest in 1830, and had established themselves securely enough down to the desert frontier, which was administered by the Bureaux Arabes. Three principal ports had been created on the seacoast—Oran on the west, Algiers centre, and Philippeville east. Striking inland from these across the Sahel and Atlas Mountains, we come to Geryville, Medeah, and Constantine, and farther on to the Algerian Sahara, to Ouargla, Laghouat, and Biskra. But the problem was how to cross the Sahara to tap the riches of the Sudan, or how to obtain security for Algerian merchants, whether Mzabites or Europeans, when crossing the desert. Various projects had been formed and various *études* made, but the exploratory expeditions have not till this century had any success. The 'Mission Flatters' was cut to pieces, and a later expedition shared the same fate.

The real masters of the desert are the redoubtable Touâreg, descended from the original tribes that colonised North Africa. They are perfectly distinct from the Arabs, who overran the country in the year following the Hegira, and who hold the original Berbers in as much contempt as the Berbers hold them in hatred. The problem for the French is 'How to cross the Sahara.' Le Chemin de Fer Algérienne has been projected to link Algiers to Senegal, to recolonise the Sahara by means of oases rendered habitable by means of artesian wells, &c., and lastly to win over the Touâreg by force or goodwill to protect the commercial caravans to Timbuctu or Katsena.* 'It has got to be done, and France has to do it.' *Bonne chance, mes amis!*

I hear this year (1908) that a camel post, *méharistes*, has been established between Insalah, in the Touat (near the Morocco frontier), and Agadez (capital of the Pays de l'Air), so that the Touâreg have been pressed into the service of civilisation. Mr Savage Landor, in his work, *Across Widest Africa*, confirms this opinion.

The latest book on the subject of this little-known but highly interesting tribe or confederation of tribes is by Harding King in *Search for Masked Touâreg* (or more properly 'veiled'). He remarks that barely one Englishman in a thousand knows aught of these wild, untamable 'sons of the desert,' which is undoubtedly true. Quite lately, on the authority of Mr Boyd Alexander, in his interesting work *From Niger to Nile*, quoting an opinion of a Captain Cotton, the ancestry of the Touâreg is traced to the Saracens, and said to date from the time of the Crusades (about 1100 A.D.), thereby inferring an Arabic or Syrian descent, while a picture is given of a Touâreg (properly Targui, singular) armed cap-à-pie, with helmet and coat of mail.

'Monsieur Cotton, a French officer, who knew the country to the north of Lake Tchad, and had encountered the nomad Touâreg, told me that these people are supposed to be descended from the Saracens, a theory that is supported by the device of a Cross which the men still carry on their clothes, knives, and shields, and the women on their ornaments, in much the same way as the Crescent has become incorporated in descendants of the Crusaders. Many of the Touâreg still possess ancient coats of mail which their ancestors took from the Crusaders.'

This is all fallacious, as, according to the best authorities—and the French are entitled to all credit in this respect—the Touâreg are descended from *l'immense famille des Berbères*, who spread themselves all over North Africa and as far south as the Sudan centuries before any Arabian tribe was even called Saracen. Other branches of this 'family' are found in the Kabyles in North Algeria, the 'Aures' Mountains, and the 'Djudjura,' and probably in the Riff tribes of Morocco, as well as the 'Mzab,' the merchants of the Tell and Algerian Sahara.

The other tribes of Arabic descent followed in the conquering wave of Mohammed and his generals. So far as our notes go, the 'Chambaas' are most associated with the Touâreg, though in matters of marauding and unrest it is very much six of one to half-a-dozen of the other. Metlili is their chief city, and is the starting-point for the caravan voyage across the desert to Katsena—the object of every Arab of the northern Sahara once in his life. '*El Djereb dona el quetran, on el feker dona el Soudan*' ('For the scab, tar; for poverty [remedy being understood], the Sudan'). The name is explained by M. Henri Duveyrier as meaning robber of the night, corresponding to our highwaymen of King

*I have adopted the French spelling of all places, as found in their many maps of the districts under review.

George's times, a surname given them by the Arabs, but the negroes call them *les voilés* (or veiled ones), referring to their custom of veiling their faces, dating by legend to the time of Solomon. In sooth, *voleurs* and *voilés* have a disagreeable affinity. The name of their confederations is as follows: the Azdjer to the north-east, the Ahaggar north-west, in the mountain Hoggar, the tribes of l'Air to south-east, and the Aouélimmiden to south-west inhabiting the hilly country Adhagh. 'We are Im ô hagh,' say the Azdjer; 'Im ô charh,' say the Ahaggar; 'Im a jirhen,' say the Touâreg de l'Air. 'Our language is temahag or temahcheq, derived from "i ô hagh," which means "he is free—he robs." The Arabs call us "*targui*, *touâreg*," from *tarek*, which means those abandoned by God, because of our refusal to adopt the religion the Arabs tried to impose on us.'

The Touâreg are divided into two branches, those of the north and those of the south. The northerners are of pure blood, more or less white, with noble frame and features. Those of the south have mingled with the negro races of the Sudan, and show it in their features. The chief towns of the north are Ghadames (said to have been a town in the time of Abraham), Ouargla, Rhat, Murzuk (in Fezzan), and Insalah (capital of the Touat); in the south Agadez, and so to Katsena in the Sudan country. They are actually and practically masters of the desert, and control all the caravan routes whether to Timbuctu in the west or to Katsena in the east. Their chief source of revenue is either the plundering of independent caravans, or—like civilised nations with their custom-houses—the exaction of a duty on all camel-borne merchandise, or a charge for escort across the desert-belt, which is most scrupulously and honestly performed when sufficiently propitiated by gifts (!).

A photograph taken of some Touâreg prisoners when I was in Algeria in 1867 gives a very good idea of their usual dress, not in the least like that put forward by Mr Boyd Alexander. Wide pantaloons, over-stockings (*serouel*), a sort of tunic confined at waist, and a high turban which is brought over to form the characteristic and invariable veil. The women, be it remarked, contrary to the custom of Moslem countries, do not use the veil. 'Mounted on his rapid *mehari* (or dromedary), which devours space, the Touâreg carries with him a complete "outfit" of terrible arms, which he uses with most prodigious skill.' On perceiving an adversary he seizes his bow and discharges with strong hand a flight of arrows. These, it is averred (but oft contradicted), are poisoned; M. Duveyrier holding the latter opinion. Then he throws his *javelot* or charges with his long and redoubtable lance, falling back on his keen two-edged sword or his hook armed with teeth, or, if dismounted, seeks to brain his foe with a strong ring of green serpentine fixed on his right arm. 'Guns are only carried by the rich, who can afford powder.'

The term 'Saracen' was given by the later Romans to the nomad bodies of Syria, who at that time, according to Carlyle in his *Hero as Prophet*, were pagans until the time of Mohammed. This gradually became a general description of all 'Moslems,' much as in later times the English and French used the term 'Turks,' which word in true spirit of Christian charity we use in one of our collects. In the Basque pastoral plays the wicked are represented by *Les Turcs et les Anglais* put to flight by the good Français.

Washington Irving was content with the word 'Moors,' in the conquest of Granada, Spain, and part of France, although the term 'Saracen' may have been applied to them, as to the Arabians who fought for the Crescent under Saladin against the warriors of the Cross. M. Duveyrier remarks on the use of the Cross as a device of the Touâreg as seen on their saddle-bows and on their shields, while the Kabyl women wear a Cross tattooed between their eyes. People of Arabian descent and followers of Mohammed would not follow this custom, having adopted the Crescent, in which 'sign to conquer.' But was not the Cross, as a Christian symbol, only adopted at the Constantine period? The Berbers probably used it as a device long before this era.

The following legend of the veiled Touâreg—why they veil their faces—is translated from the French work *L'Assimilation* (Touâreg), published in the *Presse Algérienne* (1857):

'Solomon, once on a time, lost the ring he wore on his finger, a magic ring, source of power over the multitude of genii that people the immensity. A common "boor," having found the ring, suddenly was invested with all the powers. He seized the estates of the son of David, ascended the throne—a monstrous act worthy of Satan—dishonoured the royal couch. . . . After a series of vicissitudes, Providence permitted Solomon to repossess his ring, and with it all his power and glory. The usurper was put to death, but what to do with his offspring? The king decided, however: "God is great, and has a horror of spilt blood. The infants, therefore, may live; but that they shall not be pretenders to the throne, through the rank of their mother, their noses shall be cut off, so as to distinguish them as sons of a great culprit." This sentence was executed, and to hide their shame and deformity the children hid their faces under a dark veil, and then dispersed through the habitable globe. One of these came to the arid wastes of Africa, there planted his tent, chose a companion, and became "Father of the Touâreg."' Such is the legend, and certain it is that, whether in memory of their ancestor or no, the Touâreg always have their faces veiled.

This legend is similar to that of the shepherd 'Gygés' of whom Plato speaks in his *Republic*, and also to one in the *Dictionnaire Infernale*, by J. Collin de Planey. A genie, or dæmon, seized the throne of Solomon, and after various vicissitudes was overthrown and drowned in the Lake of Tiberias.

It is also conjectured that the legend is of Arab origin, because it is of a 'humiliating charac-

ter for the Touâreg.' It is hardly necessary to observe that the Arabs would not have invented such a story of a tribe descended from the Syrian tribes or Saracens.

M. Duveyrier thinks the custom is one simply of hygiene; but if so, why do the Touâreg invariably—the exceptions being very rare—refuse to unveil, even when in a temperate climate like that of Algiers?

'The Touâreg of the north, with white faces and Caucasian features, wear a blue-black veil; by contrast, those of the south, with negro characteristics, wear the veil white. In Arabic Ahel-el Litham signifies the "veiled people."'

Although it is beyond doubt the Touâreg refused the Mohammedan religion till about 719 A.D., they are now Mussulmans; but with the exception of their marabouts (priests) they do not practise the religion taught in the Koran, by which, it may be noted, the Arabs are absolutely bound. The true Berbers possess, besides the Koran, a book of a civil code called by them the *Kanoun* (or Canon). Their God is Amanai, the Adonai of the Bible. He is 'unique.' Heaven (*adjenna*), Paradise (*idjenaouen*), where men meet with the recompense of good actions after death, is inhabited by angels (*andjilous-en*). Hell is *timai-tân-elakhart* (the last fire). The devil *iblis* (reigns).

The Cross is found everywhere—in their alphabet, on their arms and shields, the pommels of their saddles, the hilts of their swords. On their camels' saddles are bells, abhorred by Islam. The women, especially of the kindred tribe the Kabyles, wear a Cross tattooed between the eyes. This nation 'rests' on Sunday, while the Arabs observe Friday.

Monogamy is practised as opposed to the polygamy of the Arabs, and women are treated with great respect and held in honour. They are well educated and possess much property. In the *Histoire des Berbères* it is written: '*Les Berbères étaient ou Chrétiens ou Juifs*,' and their chief Koceila was a Christian (Hejira 67 de T.C.—686 A.D.).

The Mozabites are a very strict sect, and they and the Touâreg use a form very much resembling the Lord's Prayer. M. Duveyrier believes the Touâreg have some connection with the early Christians, and looks for a reconversion of these sons of the desert to Christianity from their paganism veiled in Moslemism.

The Touâreg of the south, the 'Pays de l'Air,' professed Christianity before being violently forced into Mohammedanism. Their country is still called Arroumet* ('Country of Christians'). Enough has been said to prove that, like the Jews and Samaritans, there is a racial hatred between the Berber and the Arab, as there was in the case of the Celtic Britons and their invaders, Roman or Norman. In no case will the 'Saracenic' descent bear investigation. This is confirmed by Mr Harding King in a letter to the writer commenting on the 'wild theories as to the descent from the Crusaders.'

The following story of a Touâreg wedding is given by Mr Harding King: 'Two young Tarqui were enamoured of a beauty, Fatma, of another neighbouring tribe. Moumen had most gear, camels and the like, and mounted on his swift *mehari*, and in full panoply of arms, was a "proper man" indeed. Maastan was, however, the favourite, and it was soon seen where Fatma's beauteous eyes travelled when the two would pace swiftly before the *douar* where she resided with her widowed mother. Zarah was in full plump beauty of matronhood, and had her own views of how to replace the deceased, but made no objections to her daughter being courted, especially by Maastan. Moumen, however, arrived first, and made his bid—six good camels, the wedding dress, and a negress slave—for the slimmer and thinner maiden. Some surprise was evinced when she consented to Moumen's suit, and accordingly preparations were made for the wedding festivities, as well as for the handing over of the *dot*. These were arranged according to old and ancient custom. It should be noted that, while the Arab girls are practically sold by their parents to their future husbands, the Touâreg girls are free to choose a man of their own class, and retain their property after marriage.

'Fatma and the unmarried girls of her camp held a "Court of Love," in which Moumen and Maastan, with others, took part in a tournament. They filed past the ladies at a gallop on their *meharis*, hurling their lances, firing guns, with other exercises of a fantasia. Fatma might reward her chosen cavalier with one of the stone bangles, but it was noticeable that she did not so favour Moumen at this stage.

'The marriage ceremony took place in presence of a marabout, and to all intents and purposes the marriage vows were exchanged. Then the bride and her mother mounted into the *bassours*—large cage-like structures covered with gay cloths and rich fringes, reaching down nigh to the ground, in which the desert women are conveyed from *douar* to *douar*—mounted on camel-back, and escorted by the men of her camp, armed to the teeth, proceeded to the tent of her "future" husband. About midday the cortège arrived, and was met in the usual way by Moumen and his friends, when a sham fight took place for the possession of the bride. On the bridegroom prevailing, he seized the camel and *bassour* in which sat his bride, led it to his tent, and carried off his wife into her future abode. On raising her veil, what was Moumen's astonishment to find the ripe Zarah in all her ample charms in place of the expected young maiden! Zarah was, however, mistress of the situation. It is a legal point that the sham fight was the climax of the marriage, and she coyly demanded the ratification thereof, or a number of camels if she was "divorced" or bundled out of the tent.

'Now, the "best laid plans of mice and men gang

* *Roumi* is really 'stranger;' *l'ain roumia*, a beautiful small blue flower, is supposed to refer to the blue-eyed northerners, Goths and others, settlers in Algeria.

aft agley," and Zarah and Fatma had agreed on the deception, whereby the former would obtain a husband, the latter the man of her choice. It was easy for Zarah to enter the first *bassour* unrecognised in her veil, and for Fatma to place herself in the second, closely attended by Maastan. In the confusion of the mêlée, few saw the second camel quickly led away and soon lost to sight in the undulating dunes, through which the happy Maastan conducted his "spoil" to a well-hidden *douar*. To make a long story short, Moumen eventually agreed, according to the French maxim, that if one cannot have that which one wishes, it is necessary to be content with that which one has.'

The problem of 'assimilation' of these tribes is the most prominent in French colonisation. Of the three above mentioned the first or Kabyles are decidedly the easiest to manage. They are dwellers in houses grouped in villages, are industrious cultivators of the soil, and are more akin to the Aryan type than the Semitic. They supply the Tell with labour, working in the vineyards, orange-groves, and tobacco-fields, while on their own holdings they cultivate wheat, olives, figs, and make charcoal and pottery.

We made a charming driving tour through Kabylia from Tiziouzou to Fort National, the home of the Aitha-Irjens; and later I crossed the Djudjura, ascending Lalla Kadijah (the White Lady, the highest peak), and across to Beni Mansour. Picturesque white villages, red-tiled roofs with storks as sentinels on the chimneys, crown the mamelon-like hills, clothed from foot to top with rich verdure, olive and fig trees, under which grow quantities of maize, corn, and vegetables. Down the winding paths trip groups of merry maids, Etruscan-shaped jars on their heads, to the wells for water, often as not hustled by troops of small *borichos* laden with brushwood or charcoal.

On their market of Sunday (Friday) the elders may be seen sitting in Souk el 'Djemaa,' a half-religious, half-civil assembly. The 'Souk' proper is a most animated spectacle, of which there is a graphic sketch in *Les Mystères du Peuple Arabes*, by Charles Richard (1860). Since the insurrection of 1871 the Kabyles have settled down and are quite a factor in the colonisation of Algeria.

The Arabs, nomads as was their ancestor Ishmael, dwellers in tents, are not so easily brought into line, and do not take readily to French customs. The very presence of the Madonna in the churches is an offence to Mussulmans. 'Yet,' said an experienced *colon* to me, 'it will be through the women that assimilation may come. The Arab women see and envy the freedom of the French and Mahonais women, whose husbands work for them, and are learning the lesson all too quick for their lords and masters, and may yet demand emancipation.'

When you see in the crowded 'Sok' a haughty Kaïd looking with supreme contempt on the invariable Jew, or his successor the Christian, you think how the son of Hagar is repaying the slight put on his mother by the jealous Sarah, and that the outlawed Ishmael is paying out the sons of the pampered Isaac.

THE GORDON HIGHLANDERS IN SPAIN.

A FORGOTTEN PAGE IN THEIR HISTORY.

By E. Bruce Lowe, M.A.

PART I.

From mountain-side and rocky glen
They hear, they answer, Huntly's call,
The gallant Gordons, well beloved,
Prepared to fight or fall.
Regimental Song of the Gordons.

NAPOLEON, roused to frenzied rage by the news of the intrepid advance of Sir John Moore in December 1808 upon his lines of communication, which balked his plan for the descent upon the southern provinces of Spain, declared, 'As for the British armies in Spain, I shall chase them from the Peninsula.' At that moment he commanded two hundred thousand veteran troops, while the gallant Moore could only rally from his scattered garrisons a fighting force of twenty-three thousand men; but with these he struck vigorously upon the armies commanded by Soult and Ney. Immediately Napoleon changed his plan; and although the Generals reported to him that the passes were now blocked with snow, his answer was that if the British troops could face the rigours of the winter march in the mountains, the men under his command must do likewise or die in the attempt; and he personally urged on the columns till, with the loss of many men and animals, the passes were traversed. The Spanish armies, upon whose support General Moore had relied, rapidly dwindled away; and Moore, having succeeded for the time in saving Southern Spain, recalled his advance-guard and prepared to retreat. The story of what followed is too well known to need repetition here; but in the trying marches and continuous fighting of the next four weeks the Gordons bore their part nobly, and in the battle of Corunna held the post of honour on the left wing until the defeat of the French was accomplished, but not without heavy loss, including Colonel Napier, of whom it was written, 'Every man in the regiment felt he had lost a friend. They knew that his place could not be filled.'

Previous to the attack on Napoleon's communications, the British army had been quartered in all the principal towns on the south and west of Spain and of Portugal, and in Lisbon large numbers of invalids and convalescents had been assembled. On the news of Napoleon's advance reaching Lisbon, these parties and detachments were at once formed into two battalions of about eleven hundred men each; one company of the first battalion was composed solely of men from the Ninety-second Regiment; the other companies were composed of men belonging to Forty-second, Seventy-ninth, and Ninety-first Highlanders, besides some Rifles.

Colonel Greenhill Gardyne, the latest historian of the regiment, in his most interesting and elaborate work, completed in 1903, has omitted to refer to this company, although in a foot-note he mentions the fact that some of the invalids of the regiment had joined what were called the 'corps of detachments.'

The work done by this company has, however, fortunately been preserved for us in the hitherto unpublished journal of an ex-sergeant of the regiment, who was an eye-witness of the campaign through which this detachment of the Gordons passed when it formed part of the army commanded by Sir Arthur Wellesley, who had landed at Mondego Bay. The crisis in the history of Europe was intense, for at that moment the Germans and Austrians had risen in arms against the French conquerors; and if the English Government had only sent an adequate force into Spain to support the rising of the Spanish and Portuguese allies, there is little doubt that five years' fighting in the Peninsula would have been saved. Instead, however, of providing an adequate force, the Ministers resolved to subdivide the magnificent army of ninety thousand men (which the Duke of York had collected so as to be immediately available to strike at whichever point should prove to be the most vulnerable in the armour of the French Colossus), and they despatched the hapless expedition to Walcheren and Antwerp, and sent a second corps to Sicily. Sir Arthur was compelled to accept the command of a force of only twenty thousand men, with which to secure the liberties of twelve millions of Spaniards and to overcome the combined armies of France, at that moment ten times more numerous than his own.

The soldier to whom we are indebted for the graphic details given below was Daniel Nicol, a native of Crossford, in Lanarkshire, his grandfather being a tenant under Count Lockhart of Lee. Having indulged his propensity for poaching, he was caught by Lord Douglas's gamekeeper salmon-fishing in the Clyde, and was to have been brought before the Sheriff at Lanark, when he made his way to Edinburgh and enlisted, on the 12th March 1794, in the regiment of Highlanders then being raised by the Marquis of Huntly. He mentions that, after being taken to the Council Chambers and passed by a surgeon, he received a red jacket turned up with yellow facings, white trousers, and three ostrich feathers stuck in his hat. It was not till he reached Aberdeen that he received his full uniform (a short jacket faced with yellow, kilt, and bonnet), in time for King George's birthday on the 4th June; and shortly afterwards the whole town was *en fête* when the news arrived of Lord Howe's great victory gained on the 1st June over the French fleet off Ushant. A treat was given to the soldiers in town, who paraded over the links, 'where a bullock was roasted and twelve hogsheads of porter set abroach. Dancing and sports were kept up to a late hour, while the Freemasons, with the trades in town, walked in procession with their emblems, &c.' He adds: 'Some fine-looking men were brought for our regiment by Captain Cameron of Fassifern, and on Tuesday, 24th June, the regiment was embodied by General Sir Hector Munro. The test of fitness set by the General was that each man should run past him for fifty paces, when only one man was rejected, being too old.' The Gordons then numbered seven hundred and sixty men, of whom seven hundred and fifteen were Scotch, chiefly from the northern counties, many speaking only the Gaelic language; there were also thirty-two Scoto-Irish, twelve English, and one was a Welshman.

Nicol saw service of a most interesting kind in the suppression of the rebellion in Ireland; and after engaging in the expedition to Holland, where he took part in the battle of Egmont op Zee, he passed through the whole campaign in Egypt from Aboukir to Cairo. After a spell of garrison-work in Ireland and in Glasgow, the corps was sent to Denmark and Sweden in 1807, and in the following year, on its return to England, was despatched to Portugal. It was shortly after the ignominious convention of Cintra, which for a time liberated Portugal from the French armies (when they might have fallen an easy prey as prisoners into the hands of the newly arrived and highly organised British forces), that Nicol entered upon his experiences in the Peninsula, which are detailed with so much graphic power in the very interesting manuscript which he has left behind him.

While in Lisbon he saw the departure of the Russian fleet, consisting of seven large vessels of the line and a frigate, which had been blockaded in the river by the British fleet, under Sir Charles Cotton, and which in terms of the Convention were allowed to set sail with the Russian colours flying; all to the intense indignation of the soldiers and sailors, who regarded the fleet as a lawful prize stolen from them in the moment of victory.

From August till October 1808 the regiment lay in the neighbourhood of Lisbon; and it was on the 1st October that, while on picket-duty in a ploughed field, Nicol was forced to remain all night exposed to the rain and wind, which produced a fever and obliged him to go on the doctor's list for two months. Meantime the regiment marched into Spain, and in

the following month began the retreat to Corunna. From the regiment he received a letter from an old comrade telling of his arrival at the Escurial near Madrid, and reporting the approach of the French, who were now advancing under Napoleon by Valladolid. 'We will defeat them,' said the letter-writer, 'with the help of the Spanish army, and return to England by way of France.' This prophetic utterance, which was realised in 1814, was the last communication that Nicol had with his regiment for many years.

As has been already related, the invalids of the Ninety-second left in Portugal formed a company of the first battalion of detachments, which was commanded by Lieutenant-Colonel Bunbury and Major Ross. The company of Gordons consisted of Captain Logie, Lieutenant Cattanach, Lieutenant Durie, Surgeon Beattie, eight sergeants, a piper, and seventy-six rank and file.

Sir Arthur Wellesley, having landed on 22nd April 1809, marched on the main road direct to Oporto, and came up, on several occasions, with the enemy under Soult. The Portuguese troops under Marshal Beresford joined in the march, and a battalion of these, under British officers, was added to each brigade of the British army. The company of Gordons was associated with a battalion commanded by Colonel Doyle, formerly a lieutenant of the Gordons when in Egypt, and he found that nearly a dozen of the men in the company had already served with him there. Nicol tells us that the old comrades gladly drank the health of their colonel and that of his uncle, Sir John Doyle, with whom they had also seen service. On 12th May 1809, about three in the morning, an explosion was heard which made the company stand to its arms, and this proved to be caused by the blowing up of the bridge across the Douro by the French army, which had entered Oporto and sought to cover its retreat.

Wellesley determined to force the passage of the river at all costs, and having got the enemy 'on the retreat,' to keep at them. He accordingly instantly prepared to cross this great river. The Gordons marched into Villa Nova and joined General Sherbrooke's brigade, which had landed in boats from Ovar. So close was the pursuit of the French that Nicol tells us that 'if our artillery-horses had been able to drag forward the guns, they would have taken many prisoners and have entered Oporto pell-mell along with the French.' The enemy, however, had taken possession of all the boats they could discover, and the fleet moved accordingly close into the mouth of the river and provided boats for the crossing. The Gordons' detachment, with two regiments, marched in double-quick time to the Sera convent, which the French had fortified and mounted with cannon, but which had been abandoned. 'We trailed arms and ran up the river-side through a fir-wood to a creek, where we found some large boats manned by Portuguese.' In them they crossed the river, when the French came fiercely upon them in two large columns, with cannon. The enemy were driven from the top of the bank, which was held by the Gordons till the Guards and the Third Buffs had almost crossed the river, when Nicol's battalion charged the French columns and the Fourteenth Dragoons attacked the French left and put them to rout with great slaughter. The inhabitants of Braga cheered the British troops as they approached, and took the opportunity of killing all the wounded Frenchmen they came upon, and stripping them.

After following the retreating Frenchmen for about a league, the British troops were recalled to Oporto. In the fighting the battalion had lost sixty men; and when they had got to quarters Sir Arthur addressed them and expressed how thankful he was to them for the way in which they had crossed the river, and so enabled the other regiments to follow so easily.

Nicol makes this remark in passing, that 'Marshal Soult was neither prepared to defend Oporto nor to retreat out of it, but seemed as if taken by surprise or confounded at our impudence in crossing the river in the face of the whole French army.'

At night the city was illuminated, and the men-of-war boats formed a bridge of boats by which on the following day all the cannon and cavalry were transferred to the north side.

When the regiment marched from Oporto Lieutenant John Durie was left behind sick, and the following day the same fate befell 'the good Captain Logie, which every man in the company was sorry for, the more so as no officer of the Ninety-second was left with them, and they soon felt the want of him.'

The French army, however, escaped over the mountains, to the extreme annoyance of Sir Arthur and the British troops, who blamed Marshal Beresford and the Portuguese, who had been posted in the passes to prevent this. 'But for this,' Nicol says, 'Soult's whole army would have been taken, as well as their guns and baggage. Negligence or mismanagement there was somewhere; but these things are not easily proved when committed by the higher powers. Beresford was challenged, and we heard no more of it; but General Toilson was sent back to England.' This, however, is only a soldier's surmise, as we know that it was the advance of Marshal Victor which compelled Sir Arthur to turn from the pursuit of Soult and join the Spanish General Cuesta, who had now reformed his force after being heavily defeated by Victor.

By the end of the month the troops had again marched 'over the bridge of boats across the broad and rapid Douro, and bade adieu to Oporto for ever, with its churches, convents, and good port wine. To the last the British troops paid more devotion than to the first.'

The Gordons had an unpleasant experience in crossing the broad, navigable lake between Ovar and Aveiro, for when they had embarked in boats, which were crowded, they were very uncomfortable, and the rain came on, with a high wind, so that many

of the boats were blown ashore, and the rest did not reach Aveiro till the forenoon of the following day. On landing, with Sir Arthur at their head, they were joyfully received by the inhabitants with a salute of twenty-one guns. After marching through Coimbra, they reached the river Mondego on the 4th June, when the King's Birthday was celebrated by a bathe in the river and the distribution of a pint of wine to each of the men. Now began the famous march which ended in the victory at Talavera, fought on the 27th and 28th July 1809, when the combined forces under Wellesley completely defeated the French army commanded by Joseph Bonaparte, ex-King of Naples, now King of Spain. It was for this great victory that Sir Arthur was created a peer under the title of Lord Wellington, and it is well worthy of being recorded that the Gordons had a distinct share in the honours of the day. Nicol's description of the battle is full of interest. He tells us that the army crossed the Guadiana and entered Spain with light hearts. He begins by giving a detailed statement of the officers commanding the various divisions and brigades, and supplies particulars of all the regiments in the army, which had an effective strength of twenty thousand men.

The approach of the Spanish army is well described by Nicol, who says: 'We got into a fine cultivated plain, when the French began to make their appearance in our front. Sir Arthur with his staff passed us, and we halted an hour at a village, where our cavalry dismounted and cut down some fields of ripe corn for forage. At this time we began to see great clouds of dust on the right of the plain. This was the Spanish army advancing. They had crossed the Tagus by the bridge at Almarez, and were now marching on the high-road to Madrid, driving the French outposts before them. Big words were now spoken by the boasters of taking Madrid, beating the French, and driving them out of Spain—great things were to be done that did not take place for years after.

'We halted on the 21st, and were ordered to appear as clean as possible, to be reviewed by the Spanish General Cuesta, commanding the army with which we were to act. Our army was drawn up in line. Sir Arthur and Cuesta arrived on the ground, escorted by a troop of British and one of Spanish cavalry; they rode along the line, we paying them all military honours. Cuesta was a fine, stout, rough-looking old man. He said he was happy to see us look so well after so long a march. We got one day's biscuit served out here; this was the last regular rations served out to our brigade.

'On the 22nd we marched past the Spanish Grand Army. As the French were in front, we were going to set them an example by commencing an attack on the enemy, for we thought that General Victor would give battle in front of Talavera. The Spaniards, amounting, it was said, to fifty thousand men, were drawn up on both sides of the road as we passed; they had some very heavy cannon—too unwieldy for the field—and many wagons, baggage-mules, asses, &c. This day was very warm, with much dust, and little or no water to be got. On the right side of the road was a stagnant pool; the cavalry rode through it, and some of our men went up to the knees amongst it drinking, though it was as thick as water-gruel.

'The French were drawn up in line about a league from Talavera. The attack was begun about eleven o'clock by the British artillery and our cavalry under General Anson, who turned the right of the French army, while the Spaniards under Duke Albuquerque, one of the best of the Spanish Generals, drove them back and through the town. Some houses and a field of wheat took fire, and the French retreated through the smoke to a position on the other side of the river Alberche, and broke down the bridge. The combined armies bivouacked in the vineyards and olive-grounds; the Spaniards in the town and by the side of the river Tagus, over which was a wooden bridge that kept communication with the country on the right bank of the river. Sir Arthur had a narrow escape this day. While reconnoitring, a cannon-shot was fired at him which carried away a branch of the tree under which he stood, within a few inches of his head—a lucky escape for him. He was fully determined to bring General Victor to action on the morning of the 23rd, and we were in readiness to march off the ground at five o'clock, when we were countermanded—to our disappointment. The Spanish General Cuesta, it is reported, would not fight on a Sunday. Well, he might be a very good Christian General, but he was no match for the French unless he could take, at any time, any advantage that might occur. This was an opportunity lost, for during the night the French retreated to St Olala, falling back upon their own strength.

(To be continued.)

THE HILL OF PEACE.

A SUN-SWEPT hill of russet grass,
Where fleet cloud-shadows softly pass,
And harebells—fallen flakes of sky—
Sway as the breeze goes dimpling by.

And here, clad in her gown of green,
Peace walks, sweet goddess! all unseen.
Through the dim beechwood's mystic aisles,
And where the open downland smiles.

Over the deep leaf-drifted ground
Her trackless footsteps give no sound;
Only the trees make sudden stir
And wood-doves croon to welcome her.

And through the trees she may look down
On spreading vale and clustered town,
Where men seek Peace in vain, for still
She dwells for ever on the hill.

THE DREAM OF EDMUND NORWAY.

By S. Baring-Gould.

EDMUND NORWAY, captain of the merchant-vessel *Orient*, on her voyage from Manila to Cadiz, wrote in the log, which is still extant:

'Ship *Orient*, *Feb.* 8, 1840.

'About seven-thirty P.M. the island of St Helena N.N.W., distant about seven miles; shortened sail, and rounded to, with the ship's head to the eastward; at eight set watch and went below, with a letter to my brother, Nevill Norway. About twenty minutes or a quarter before ten o'clock went to bed, fell asleep, and dreamt I saw two men attack my brother and murder him. One caught the horse by the bridle and snapped a pistol twice; but I heard no report. He then struck him a blow, and he fell off the horse. They struck him several blows, and dragged him by the shoulders across the road and left him. In my dream there was a house on the left-hand side of the road. At five o'clock I was called, and went on deck to take charge of the ship. I told the second officer, Mr Henry Wren, that I had had a dreadful dream, and dreamt that my brother Nevill was murdered by two men on the road from St Columb to Wadebridge; but I was sure it could not be there, as the house there would have been on the right-hand side of the road, but it must have been somewhere else. He replied, "Don't think anything about it. You West Country people are superstitious; you will make yourself miserable the remainder of the passage." He then left the general orders, and went below. It was one continued dream from the time I fell asleep until I was called, which was five o'clock in the morning.

EDMUND NORWAY,
Chief Officer, Ship *Orient*.'

After this, in the log-book, follow the several entries of the rest of the voyage.

From the Cape of Good Hope to St Helena the course would be N.N.W., and with a fair wind the ship would cover about eighty or ninety miles in eight hours. So that at the noon of the day 8th February she would be about a hundred miles S.S.E. of St Helena—that is, in about five degrees west longitude, as nearly as possible. The ship's clock would then be set, and they would keep that time for letter-writing purposes, meals, ship-routine, &c.

Ship, long.	5°	0′	0″ W.
Bodmin, long.	4°	40′	0″ W.
	0°	20′	0″ W.

The difference would be twenty minutes of longitude, and the difference between the two places, where were Edmund Norway and his brother Nevill Norway one degree apart, would be four minutes. Reduce this to seconds: $4 \times 60 \times 20 \div 60 = 80$ seconds—that is, one minute twenty seconds. Therefore, if the murder as dreamt had taken place it must have occurred at 10·30 P.M.

Now, concerning this entry in the log-book, there can exist no doubt whatever.

Mr Nevill Norway, a timber and general merchant, residing at Wadebridge, was at Bodmin, in Cornwall, on the 8th February 1840, on horseback. About four o'clock in the afternoon he was transacting some business in the market-place, and had his purse in his hand, and opened it, and turned out some gold and silver, and from the silver picked out the sum that he required and paid the man with whom he was transacting business. Standing close by, and watching him, was a young man named William Lightfoot, who lived at Burlorn in Egloshayle, and whom he knew well enough at sight, and to whom, in charity, he had given the coat this fellow then wore.

Mr Norway did not leave Bodmin till shortly before ten o'clock, and he had got about six miles' ride before him ere he reached home. The road was lonely, and led past the Dunmeer woods. He was riding a gray horse, and he had with him a companion, who accompanied him along the road for three miles, and then took his leave and branched off in another direction.

A farmer returning from market somewhat later

 [*All Rights Reserved.*]

to Wadebridge saw a gray horse on the road, saddled and bridled, but without a rider. He tried at first to overtake it; but the horse struck into a gallop, and he gave up the chase. His curiosity was, however, excited, and upon his meeting some men on the road and making inquiry, they told him that they thought that the gray horse that had gone by them belonged to Mr Norway. This induced him to call at the house of that gentleman, and he found the gray steed standing at the stable-door. The servants were called out, and spots of blood were found upon the saddle. A surgeon was immediately summoned, and two of the domestics sallied forth on the Bodmin road in quest of their master. They made their way for about two miles, when one of them perceived something white in the little stream of water that runs beside the highway and enters the river Allen at Pendavy Bridge. They examined it, and found the body of their unfortunate master, lying on his back in the stream, with his feet towards the road; and what they had seen glimmering in the uncertain light was his shirt-frill. He was quite dead.

The body was at once placed on the horse and conveyed home, when the surgeon, named Tickell, proceeded to examine it. He found that the deceased had received injuries about the face and head, produced by heavy and repeated blows from some blunt instrument, which had undoubtedly been the cause of his death. A wound was discovered under the chin, into which it appeared as if some powder had been carried; and the bones of the nose, the forehead, the left side of the head, and the back of the skull were frightfully fractured.

An immediate examination of the spot where the body had been found ensued, and on the left-hand side of the road was seen a pool of blood, from which to the rivulet opposite was a track produced by the drawing of a heavy body across the way, and footsteps were observed as of more than one person in the mud; and it was further noticed that the boots that made the impress must have been heavy. There had apparently been a desperate scuffle before Mr Norway had been killed. There was further evidence. Two sets of footprints of men could be traced as if pacing up and down behind a hedge, in an orchard attached to an uninhabited house hard by; as it appeared, those of men on the watch for their intended victim. At a short distance from the pool of blood was found the hammer of a pistol that had been but recently broken off. Upon the pockets of the deceased being examined it became evident that robbery had been the object of the attack made upon him, for his purse and a tablet and bunch of keys had been carried off.

Every exertion was made to discover the perpetrators of the crime. Sir William Molesworth of Pencarrow sent his bloodhounds to track the murderers; but as they ran in a direction opposed to that which the superior wisdom of the searchers supposed they ought to have taken, they were called off.

Jackson, a constable from London, was sent for, and mainly by his exertions the murderers were tracked down. A man named Harris, a shoemaker, deposed that he had seen the two brothers James and William Lightfoot, of Burlorn in Egloshayle, loitering about the deserted cottage late at night after the Bodmin fair; and a man named Ayres, who lived next door to James Lightfoot, stated that he had heard him enter his cottage at a very late hour on the night of the murder, and say something to his wife and child, whereupon they began to weep. What he had said Ayres could not tell, though the partition between the cottages was thin.

This led to the examination of the house of James Lightfoot on 14th February, when a pistol was found, without a lock, concealed in a hole in a beam that ran across the ceiling. As the manner of Lightfoot was suspicious, he was taken into custody. On the 17th his brother William was arrested in consequence of a remark he made to a man named Vercoe, that he was in it as well as James. He was examined before a magistrate, and made the following confession:

'I went to Bodmin last Saturday week, the 8th instant, and in returning I met my brother James just at the head of the Dunmeer Hill. It was just come dim-like. My brother had been to Egloshayle, Burlorn, to buy potatoes. Something had been said about meeting; but I was not certain about that. My brother was not in Bodmin on that day. Mr Vercoe overtook us between Mount Charles turnpike gate at the top of Dunmeer Hill and a place called Lane-end. We came on the turnpike road all the way till we came to the house near the spot where the murder was committed. We did not go into the house, but hid ourselves in a field. My brother knocked Mr Norway down; he snapped a pistol at him first, but it did not go off. Then he knocked him down with the pistol. He was struck whilst on horseback. It was on the turnpike road between Pencarrow Mill and the directing-post towards Wadebridge. I cannot say at what time of the night it was. We left the body in the water on the left side of the road coming from Wadebridge. We took money in the purse, but I do not know how much it was. It was a brownish purse. There were some papers which my brother took and pitched away in a field, on the left side of the road, into some browse or furze. The purse was hid by me in my garden, and afterwards I threw it over the Pendavy Bridge. My brother drew the body across the road to the water. We did not know whom we stopped till, when my brother snapped the pistol at him, Mr Norway said, "I know what you are about. I see you." We went home across the fields. We were not disturbed by any one. The pistol belonged to my brother. I don't know whether it was broken. I never saw it afterwards, and I do not know what became of it. I don't know whether it was soiled with blood. I did not see any blood on my brother's clothes. We returned

together, crossing the river at Pendavy Bridge. My brother then went to his home, and I to mine. I think it was nearly about eleven o'clock.'

The prisoner upon this was remanded to Bodmin Jail, where his brother was already confined. Eventually the two wretched men were tried at Bodmin on 30th March 1840, and were sentenced to death, and both were executed on 13th April.

Now, the curious feature of the story is this: that Edmund Norway thought that there must have been nothing in his dream because in it he saw the ruined cottage on the right-hand side of the road, and as he remembered the highway it ought to have been on the left hand. But he was not aware that since he had left the neighbourhood the road had been remade, and had been carried to the side of the cottage, leaving it on the right hand.

This is a well-authenticated and most curious story of a dream, and I do not see how it can be accounted for by thought-waves.

There are more things in heaven and earth, Horatio,
Than are dreamt of in your philosophy.

A PAWN IN THE GAME.

CHAPTER XXXIX.—A SURRENDERED ARMY.

WHEN they were within a mile of the gray walls of Cairo, Budgeon rode off towards the British camp in search of General Hutchinson; but Jack, with Gray and his men, pushed on towards the city. The sun was setting; the black shadows lay long drawn out on the arid soil. Suddenly there came from the city the deep, sustained sound of a gun.

Gray pulled up instantly. The cannon-shot puzzled him. Had fighting broken out in spite of the agreement to surrender? Three armies—French, Turkish, British—who had been fighting each other only a few hours before, and were now tumbled together in an area so narrow, made a very explosive human compound. A jest, a passing quarrel, a hasty blow, might easily spread into a battle.

While Gray with tightened rein leaned forward in his saddle, staring at the city, there came the sound of a second gun, and presently of a third. This was not the voice of guns in battle—quick, sustained, and furious; they were minute-guns—slow, measured, rhythmical. For a moment Jack thought they were the lament of a high-spirited army for its defeat.

But Gray was pushing on. He had plainly guessed the significance of the guns, and Jack followed him. A crowd was pouring out of the gate of the city nearest the river. At its centre were long, steady lines of French soldiers. They moved at a slow pace, with bowed heads and arms reversed. In the space betwixt the two lines was a gun-carriage with a coffin lying upon it, a group of officers, bareheaded, following in the rear.

'That is Kléber's body,' said Gray. 'They are carrying it back to France, the greatest honour that could be paid to a soldier.'

Jack looked with wonder at this spectacle of an army in the hour of its defeat honouring its dead leader.

'And he was not a Frenchman after all,' Gray went on, 'but a German, and the best man they had in Egypt.'

Kléber was no doubt a magnificent soldier, and amongst all the gallant men who followed Bonaparte in the expedition to Egypt he played the noblest part. When Bonaparte suddenly sailed for Europe the act was nothing less than a betrayal. It was the escape of a General leaving his army to be destroyed. The French soldiers in Egypt, when the event was known, were at the point of mutiny. Why should not the rank and file follow the example of their Commander-in-Chief? The shipping at Alexandria was actually seized by the troops, who were bent on returning to France.

It was then that Kléber played a great part. He and Bonaparte were in open feud with each other, and the command of the army he had abandoned was thrust by Napoleon on Kléber as a trap. Kléber's wrath was furious and open; but he remembered his duty as a loyal soldier, and his example saved the whole French army in Egypt from going to wreck. He was a sort of embodied conscience for his troops—a soldier's version of conscience, no doubt, with a very odd ethical strain running through it—but it was effective. Frenchmen are keen to recognise and quick to honour a noble act, and Kléber's loyalty to the task thrust on him restored the morale of the French.

When, a few months afterwards, Kléber fell under the assassin's knife, the grief of the army was deep and passionate. They were returning now to France, but they would not leave the dead body of the noblest soldier of them all to lie under the Egyptian sands; and with roll of drums and the peal of minute-guns, through long ranks of soldiers with bowed heads, Kléber's dead body was being carried to the boats. Jack was near enough to the French lines to see the faces of the men. They were veterans, their faces hardened in the furnace of battle and brown with the suns of Egypt; but many were in tears, some were openly sobbing.

At a little distance behind the gun-carriage was a cart with a bundle lying on it.

'That,' said Gray, 'must be the skeleton of the assassin. The beggars impaled him, poor wretch! and now they are taking his bones to France to show how they avenged Kléber's death.'

At this moment a troop of Turkish officers riding

past suddenly drew up, and a couple of their leaders pushed forward to stare at the passing coffin. It was the Grand Vizier with his staff.

'That is the man,' whispered Gray, 'who paid for the assassin's knife. The murderer, by Jove, looking at his victim!'

Jack was near enough to the Grand Vizier to see his face clearly. The strong features were impassive; the eyes that stared at the coffin had certainly no look of either remorse or pity in them. What pity, indeed, had a Turk to waste on a dead Frenchman?

The next day Jack succeeded in obtaining an interview with General Hutchinson. The British General had, beyond question, some of the qualities of a great soldier. He took command of the army after Abercromby's death, and his march to Alexandria was one of the most daring feats ever attempted. With five thousand British troops and a body of very uncertain auxiliaries in the shape of the Turkish forces, he marched to besiege a city garrisoned by thirteen thousand French veterans, leaving at Alexandria—within striking distance of his base, that is—another French army over ten thousand strong.

But seldom have fine soldierly qualities been hidden under a less soldierly guise than in the case of Hutchinson. As he sat in his tent Jack stared at him with wonder. His dress was slovenly; his shoulders were rounded; he blinked at his visitor with short-sighted eyes. His long, irregular features were yellow as if with jaundice. His speech was nervous and hesitating. He rose as his visitor entered, and went across his tent to a table to obtain a paper, and Jack could see that he walked in a fashion so shambling and ungainly that it would have filled a drill-sergeant with horror.

His manner was ungracious, and he stared at Jack while he told his story with eyes that seemed to be gazing into mere space. He offered no comment on the tale.

'You can go down with the troops,' he said curtly when Jack explained his anxiety to reach London. But this, Jack urged, meant much loss of time.

'I understand, sir, Colonel Montresor starts at once with despatches for London. General Baird was courteous enough to send me with his aide-de-camp; will you allow me to travel with Colonel Montresor?'

Hutchinson shook his head peremptorily.

'You have made the acquaintance of Lieutenant Gray,' he said; 'you can be attached to the mess of the Royals.' And with that he dismissed him.

Jack could only register the vow that, while he would start with the troops, he would break away for the seacoast at the earliest possible moment.

The next day the columns began their march, and seldom in the whole history of war has a spectacle so strange been witnessed. It was a procession of three armies, all equipped for instant battle; but two of them were escorting the third, under a treaty of surrender, to the seacoast.

The Turkish army marched first. It moved on a wide, irregular front, with flanks that contracted or spread themselves out irregularly. It resembled a mob rather than an army. Next, with a wide interval betwixt the two, came the British force, a little over four thousand strong. It was under Moore, a soldier with a genius for discipline that left an enduring mark on the British army of that day; and, as a matter of pride, the British troops were in the most exact order. They formed a tiny body—square, compact, solid, the ranks dressed as though on parade, the officers riding on the flanks of the columns, the guns with ammunition-wagons in the intervals betwixt the battalions, flanking-parties thrown out on either side.

Last came the French, an army of veteran troops familiar with victory; but its formation was loose: the columns were irregular; the officers marched or rode in clusters as they pleased. It was nearly fourteen thousand strong, with fifty guns, and it had surrendered to a force less than half its own strength.

Jack watched with astonished eyes the procession of flags go past him—Turkish, British, French; and the stream of faces was more picturesque than even the moving forest of flags. The Turks, in flowing dress, with fez and turban, with dark-visaged, expressionless faces; the square-shouldered, ruddy-faced British; the French, most of them little men, olive-complexioned, quick-eyed, with restless gestures. The Nile was black with boats carrying the sick, the wounded, and the plunder of the French army.

Jack meditated long on the spectacle. This, then, was the end of the proud army Napoleon led to Egypt. The fleet that carried that army had been shattered by Nelson's guns, and every ship in it was either sunk or a prize. Of the forty thousand gallant men with whom Bonaparte sailed from France, a third lay in nameless graves in the sands of the desert; another third was here, marching under the conduct of a British force less than half its own strength to the seacoast, to be sent back to France with the ignominy of surrender lying upon it; another third was besieged at Alexandria, and in turn would no doubt surrender.

The dream of the conquest of the East and a triumphant march to India was ending in a fiasco of this scale. Jack felt he was looking on a disaster sufficient to wreck the fame of a Cæsar.

And yet his old Brienne comrade had emerged from it with fortunes undestroyed! Somehow he so dazzled the imagination of France that she forgot she owed to him a lost fleet and an abandoned army. So the failure in Egypt was only the stepping-stone to what it was already clear would be a throne. Was it genius, or only chance, which thus made disaster itself—and disaster on such a scale—the title to a prize so stupendous?

The human memory is very eccentric. It has what may be called its blind spots, patches where it fails to register events or where the machinery for

reproducing them refuses to work. Every one remembers the surrender of Marshal Wurmser at Mantua in 1797 and of General Mack at Ulm in 1805. These are amongst the splendours of Napoleon's career. But no one, somehow, remembers the surrender of the army Napoleon himself led into Egypt, and abandoned there—a surrender as complete as that of the Austrians at either Mantua or Ulm.

As Jack watched the strange spectacle offered by the three armies, he reflected how widely his career and that of his old comrade had diverged. He had just struggled out of the ignominy of a slave's life; '*Paille au nez*' was on the steps of a throne. Jack knew he might have escaped that hateful slavery if he had accepted Bonaparte's offer outside Acre. Yes, his inconvenient conscience *had*, as his Brienne comrade warned him, 'spoiled his career.'

And yet he felt that he would go back to the sands of the desert and to the ignominy of Bedouin slavery a hundred times over rather than stoop to the baseness of such an errand as Bonaparte had proposed to him. He had lost some years of his life; but at least he had kept his conscience clean, and he had emerged from the desert and its sufferings with character strengthened and purified. Bonaparte's dazzling career had a strain of falsehood and of titanic selfishness running through it. That career, it was true, had escaped—though only by the narrowest interval—eclipse and ruin in Egypt, and had run on into new and unguessed splendours. But Jack felt sure that in the long-run it must end in failure. It was in quarrel with eternal morality. The Egyptian failure, which no one seemed adequately to realise, was only the prophetic hint of some yet greater and final disaster.

The three armies camped at night in the order in which they marched; but the French, with true military instinct, changed their formation. They threw themselves into a great square, with the Nile for the fourth side, and artillery and baggage in the centre. It was thus a force ready to strike at a moment's signal. But when the camp-fires were lit and sentries posted, many of the officers as well as of the rank and file both of the British and French wandered into each other's lines and sat in groups round friendly camp-fires.

From a hundred such groups the sound of jests and of laughter, with broken fragments of French and English, rose in the night air. There is a freemasonry amongst soldiers under such conditions. Only a few days before they were eager to meet at the bayonet's point. Now they might have been old and trusted comrades.

On the second night of the march a group of officers of the Royals, with Jack amongst them, strolled into the French lines. As they passed a camp-fire the light of the flame fell on a face which Jack thought he knew. He stopped and looked more closely. It was Corporal Lebrun, now wearing a sergeant's badge, and looking a little leaner and older than when they parted outside Acre. The sergeant looked up as Jack halted, then sprang to his feet and stood at the salute. Jack put out his hand with a smile and a hearty word of welcome.

'I am glad to see you have won a step, sergeant. Thank you for that gift of your pistol when we parted.'

The sergeant smiled afresh. 'I knew the Arabs would not hold you long, monsieur; but I hardly thought we should meet again in Egypt. How did that *canaille* treat you?'

For a few minutes the pair stood chatting, while the officers of the Royals moved on.

'But, sergeant,' said Jack as they were about to part, 'you did not get into Acre after all.'

'No,' replied the Frenchman with an execration; 'and that is why we are here;' and, with a glance of soldierly disgust, he flung out his hand in the direction of the British and Turkish camps. 'We are tired of Egypt,' he went on in explanatory tones; 'there is a bigger field in Europe, and so we have agreed to go there.'

'It is not a surrender, then?'

The sergeant's face flushed. 'The veterans of the army of Italy do not surrender. We march with our guns and flags; there is no dishonour on our colours.'

Sergeant Lebrun evidently tried to persuade himself that the march down the Nile was a friendly arrangement. The armies, on his theory, resembled duellists who by agreement were moving to some more suitable field. And Jack forbore to remind him that arms and guns were to be surrendered by even 'the veterans of the army of Italy' when they embarked at Rosetta.

'We have been three years in Egypt,' the sergeant went on, 'and no sensible man wants to stop here any longer. Egypt is an empty egg-shell. We shall be worth more to France *there* than here;' and he pointed in the direction in which he supposed Europe to lie.

Jack could not deny this. 'Our lads,' he said, 'seem very friendly with yours.'

'Yes,' said the Frenchman with a patronising air; 'they are good fighters, but they have no *élan*—no imagination. But there is no use our breaking each other's heads in this wretched country. We ought to fall into line together against those —— Turks.'

'Where is Lieutenant Ricord?' asked Jack.

'Kléber shot him.'

'Kléber!'

'Yes. He was in a plot to seize a ship and sail for France, and in the scuffle his major was killed. An example had to be made, and Lieutenant Ricord could be better spared than anybody else. The General wanted to stiffen discipline.' And Sergeant Lebrun plainly thought this a quite sufficient explanation of the fate of Lieutenant Ricord.

(To be continued.)

SANITATION BY ELECTRICITY:

THE PRODUCTION OF DISINFECTANT FROM SEA-WATER BY ELECTROLYSIS.

By F. A. A. Talbot.

N these days of populace-congestion, especially in the artisan and poorer quarters of our large cities and towns, and the necessity of enforcing strict regulations concerning sanitation for mutual protection and the prevention of contagious disease, any means by which the principles of hygiene may be simplified and cheapened so that the inhabitants themselves may be encouraged to assist in the work of the health departments affects the welfare of the community at large. The crowded nature of these areas and the too favourable conditions that prevail for the propagation of disease render this question extremely difficult. It is only by the liberal use of disinfectants that the neighbourhoods can be maintained in a more or less safe state of cleanliness. Thus the problem is resolved into a simple though continuous battle between the microbe and its destructive or restraining agent as represented by a powerful deodoriser. But the distribution among the humbler classes of the conventional disinfectant as represented by carbolic in either of its forms is an expensive undertaking, as is testified by Dr William F. Alexander, the Medical Officer of Health for the metropolitan borough of Poplar, where the distribution of carbolic disinfectants among the one hundred and seventy thousand inhabitants of the district entailed an expenditure of eight hundred and sixty-two pounds five shillings and sevenpence during the year 1905. This is one of the most densely populated areas of London, and it is only by great efforts on the part of the authorities that cleanliness can be preserved.

With the view of facilitating the utilisation upon a more widespread basis of an efficient disinfectant for all purposes, Dr Alexander urged the adoption of a new system of producing a powerful deodorant which has been used with conspicuous success in one or two other cases—notably at Worthing during the typhoid epidemic of several years ago, and in the naval hospital at Netley. In the first-named instance the plant for carrying out the operation was only of a temporary character, but it proved remarkably efficient in combating the propagation of the typhoid bacilli. The process is simplicity itself, consisting purely of the passage of an electric current through sea-water; and in view of the ease with which the disinfectant can be produced, it is one that is eminently adapted to the exigencies of an extensive and crowded community as represented by such a densely populated poor district as Poplar.

As is well known, the fundamental constituents of sea-water are the chlorides of sodium and magnesium. When an electric current of sufficient intensity is passed through this solution a hypochlorite is formed possessing a high disinfecting value; in fact, according to Dr Klein, the eminent bacteriologist, the hypochlorites are exceedingly powerful disinfectant agents whether used in the presence of sewage or other organic matter; and, furthermore, they are true deodorants, which is not the case with those agents evolved from a coal-tar derivative, of which carbolic acid is the most familiar example. Every person is aware of the relief secured from the bathing of an open wound in sea-water, which not only reduces inflammation, but is also an excellent means of cleansing it of pus and other matter which militates against healing.

It is the more general and extended application of electricity that has enabled electrolysed sea-water to be brought so prominently before the public as a commercial possibility both economically and practically. The majority of our large towns now possess an electric lighting installation whence the necessary electric energy, the consumption of which is very small, can be cheaply secured. For ordinary purposes the general current-main supply may be used, though for a small apparatus it may be found requisite to reduce the voltage of the current.

Under the disintegrating influence of the electric current during its passage through the sodium and magnesium chlorides solution in the special apparatus known as the electrolyser the magnesium chloride becomes decomposed, as does also the water. At the positive pole of the electrode nascent chlorine and nascent oxygen or ozone are formed, and these two bodies immediately combine and form an oxygenated compound of chlorine, which, though unstable, possesses great oxidising power, and, moreover, it is soluble in the solution in which it is formed. The hydrogen resulting from the decomposition of the water together with the magnesium collects at the negative pole, producing magnesium hydrate, of which a part combines with the chlorine compound released, while the balance remains in suspension in the tank or electrolyser. The oxygenated compound of chlorine or hypochlorite is disinfecting, deodorising, and bleaching, like calcium hypochlorite, which is the active ingredient of bleaching-powder. The action of these chlorides is to all intents and purposes an oxidising one, since the chlorine is liberated by the action of the acids and to a certain degree by the carbonic acid in the atmosphere, reacts on water, and evolves oxygen, which in its nascent condition exercises a most powerful effect upon all organic bodies, especially those which are in the incipient stage of putrefaction.

The reduction of this simple process to commercial practicability has been effected by a French chemist, M. Hermite, who in 1893, as a result of

prolonged experiments, conclusively demonstrated that such a solution could be prepared at a reasonable cost by electrolysis. But it was obvious that if the method were to be universally applicable, it was essential that it should be available for towns remote from the sea—as are, indeed, the majority of the industrial centres in which congestion of population is the rule; it would be practically impossible for our inland towns to secure sufficient supplies of sea-water for the process. This difficulty has been overcome by the production of artificial brine from those principal constituents of sea-water, chloride of sodium and chloride of magnesium; which, strange to relate, has been found to be more efficient than the natural sea-water, owing to the high proportion of organic matter in suspension in the latter. The two substances are contained in separate saturators, from which the solutions are conveyed to the electrolytic tanks and submitted to the electric current. Since 1893 the process has undergone several improvements, and the most up-to-date plant of its type is that installed in the buildings of the Poplar Borough Council through the indefatigability of Dr Alexander, the Medical Officer of Health.

This eminent authority upon municipal sanitation and hygiene had for some time been impressed with the possibilites of such a process, and after investigating the large plant that is in operation at Rolleville in France, he sought the co-operation of Mr Bowden, the borough electrical engineer, by whose assistance the electrical difficulties were overcome, and urged its installation at Poplar. Curious to relate, however, his suggestion was vigorously opposed in certain quarters, on the plea that it was purely an experimental scientific development, and that its introduction would be attended with failure. Dr Alexander, however, continued his agitation, pointing out the incontrovertible fact that something like four hundred pounds were being expended annually in the provision of carbolic acid in powders and solution forms, and that by the electrolytic process, once the initial outlay had been overcome, a great economy could be effected which in time would more than recoup the preliminary capital expenditure; and at last the installation was sanctioned.

This plant is capable of producing sixty-six gallons of disinfectant per hour, the strength of which is a proportion of one part of chlorine to one thousand parts of water. This strength is sufficient for deodorising sewage and other purposes, but for ordinary domestic sanitary application half-a-part of chlorine to the same proportion of water is adequate. The saturated solution of sodium chloride and magnesium chloride is placed in an elevated tank, and from this point the liquid flows through four double troughs or cells constituting the electrolyser, arranged in steps one above the other to the delivery-duct at the bottom. Thus the flow of the solution is gravitational, a simple and automatic continuous method of working. The cells are each divided by a lateral partition, and in each of these two divisions five distinct 'elements,' comprising one positive and two negative plates, are suspended, the design being somewhat similar to that adopted in the ordinary type of accumulator. The positive electrodes comprise slabs of slate, round which are wound platinum wires which are perfectly indestructible, while the negative electrodes are of zinc. As there are four troughs similarly divided, with ten 'elements,' an aggregate of forty cells is thus secured. From the tank the magnesium and sodium chlorides solution enters the uppermost tank through a funnel, passes along the front division of the trough, and returns along the rear side of the lateral partition over a weir into a subdivision, from which it is drawn off through a U-shaped glass tube into the second trough, when the same cycle of operations is repeated, and so on until at last it falls from the lowest trough into a storage carboy. During the passage of the solution through the cells it is submitted to the electrolytic action of an electric current varying from two hundred and thirty to two hundred and fifty volts, and from fifteen to seventeen amperes, from the main cables of the borough's lighting circuit, the power per cell thus averaging from 5·7 to 6·2 volts per cell.

In order to ascertain whether the apparatus is operating correctly gauges are provided, together with a thermometer to indicate the variations in temperature occurring during the electrolytic action, since the latter is attended with a certain proportion of heat. This varies according to the intensity of the saline solution; and to control the electric current intensity a regulator or rheostat is used. It is also essential to agitate the contents of the mixing-tank from time to time, to accomplish which a special device has been designed. At the side of the electrolyser is a small bottle containing a solution of caustic soda, which is used to neutralise any free acid that may be present, and to act as a preservative, and this falls into the carboy drop by drop as it is being charged with the electrolysed disinfectant, the liquid in the carboy being stirred by means of an ebonite rod to ensure combination of the two fluids.

It will be realised that the process of manufacturing the disinfectant upon these lines is simplicity itself. The actual wear and tear upon the apparatus is practically a negligible quantity, the only parts requiring replacement being the zinc electrodes; but even this renovation is only necessary once in about seven years. The positive electrodes, being composed of platinum, are indestructible, and, moreover, in view of the high price of the metal, always constitute a valuable asset. It is imperative, however, that the apparatus should be maintained in a scrupulously clean condition to effect economical working and efficiency. The tanks or cells require daily flushings with clean water to remove any precipitate formed during electrolysing and to prevent encrustation

upon the electrodes themselves. A certain amount of deposit upon the latter is bound to ensue, and unless these are frequently cleansed this becomes firmly adhered to the exterior surfaces of the electrodes, nullifying or appreciably reducing their action.

The disinfectant produced in this manner is clear and of a slightly yellowish colour, emitting a decided but not unpleasant smell of chlorine, the proportion of which ranges from 4·5 to 5·5 grammes per litre. Bearing in mind the powerful germicidal properties of chlorine, this proportion is adequate for general disinfecting purposes, as practical application has conclusively demonstrated. At first sight there might be some doubt as to the stability of a disinfectant produced upon this basis; but the deterioration in cold weather, with the liquid stored in sealed non-actinic bottles, is almost insignificant, while when reserved in bulk in carboys the solution has been found to be approximately as strong at the end of a year as when it issued from the electrolyser.

In regard to its disinfecting potentialities, the most searching investigations have been carried out to emphasise its utility in this connection. When applied to the effluent from a sewage-farm it completely deodorises and sterilises it. Upon its application to such dangerous filth as putrefying meat, fish, or other decomposing matter, the organic substances resulting from such action, as well as the gases, such as sulphuretted hydrogen, hydro-sulphate of ammonia, &c., are destroyed with great rapidity. For inland towns where this system is in operation, and where supplies of sea-water are unavailable, M. Hermite has prepared a special compound, the fundamental constituents of which are the chlorides of sodium and magnesium in association with a certain secret preservative. When the electrolytic disinfectant produced from this material is applied to decaying substances such as those already mentioned, the foul smell attending such decomposition disappears instantly; chlorine is evolved, and continues to evolve as long as any oxidisable substances as represented by the microbe-infested matter remain. This chemical reaction shows that an excess of nascent chlorine is in course of production, and this permeates the liquid, finally coming into close contact with the existent germs, which are speedily destroyed; and the fact that this chemical reaction is in progress is testified by the distinct smell of chlorine which prevails, together with the development of the chlorine gas.

The greatest advantage, possibly, of this antiseptic is the facility with which it can be handled, owing to the absence of any poisonous qualities. Consequently no distinctively coloured bottles such as are necessary with other deodorisers like carbolic acid become necessary. It constitutes an excellent gargle for the throat, a liniment for wounds, or a wash for the eyes, it only being necessary to make a 10 per cent. solution. There is a slight burning sensation experienced, but it is of purely a passing character, while the taste is distinctly salt. This renders it of great value in the sick-room; in fact, it is considered to be more efficient as an antiseptic than the corrosive sublimate, the familiar expression for bichloride of mercury, which is so extensively employed in hospitals.

The actual cost of production, as already mentioned, is comparatively trifling. The electrical consumption averages ninepence per hour, representing a weekly expenditure under this head for an eight-hour day of six shillings, and for this sum four hundred and forty gallons of disinfectant can be produced. To this outlay, which is necessarily the heaviest item, must be added the cost of the chloride of sodium represented by common rock-salt, the chloride of magnesium, and the caustic soda, which average twenty-four shillings, seventy-seven shillings and sixpence, and eighty shillings and eightpence per ton respectively. During the past year the apparatus in operation by the Poplar Borough Council produced seventeen thousand gallons of fluid, the prime cost of which was thirty-three pounds ten shillings and threepence, made up as follows: electric current, two thousand five hundred and forty-three units at three-halfpence per unit, fifteen pounds seventeen shillings and tenpence; rock-salt (four tons), four pounds sixteen shillings; chloride of magnesium (two tons), seven pounds eighteen shillings and ninepence; caustic soda (one ton), four pounds and eightpence; water, seventeen shillings. Of course, in addition to this must be added the cost of labour in manufacturing, packing, delivering, and issuing the disinfectant, which represents an additional outlay of four hundred and seven pounds twelve shillings and sevenpence, while other incidental expenses bring the total to five hundred and ninety-seven pounds fourteen shillings and threepence. In view of the fact that this is the result of the first year's working, which was essentially of an experimental nature, and during which period considerable experience was obtained which will result in several appreciable economies being effected, it is in every way a success, especially when it is remembered that the cost of distributing carbolic disinfectants was nearly 30 per cent. higher. During 1905 the expenditure upon carbolic fluid and powder amounted to two hundred and forty-two pounds and seventy-two pounds two shillings respectively, aggregating three hundred and fourteen pounds two shillings; which total was augmented by other incidental expenses to eight hundred and sixty-two pounds five shillings and sevenpence, of which wages and special bottles constituted the heaviest items. To-day the health department produces for thirty-three pounds what formerly cost them three hundred and fourteen pounds.

Owing to the facility and cheapness with which the disinfectant can be produced, it is now being most extensively employed both by the inhabi-

tants of the borough for purely domestic purposes, the flushing of streets, sewers, &c., and by the borough's numerous hospitals, workhouses, asylums, and other similar institutions, which receive their supplies free of cost. The enterprise of the council in cheapening and improving the facilities for procuring such an efficient deodoriser is appreciated by the poorest classes, who are enabled to secure unlimited supplies of the fluid merely for the fetching, and indeed are seconding the efforts of their health department by the liberal use of the germicide, whereas under the previous arrangements they were unable to afford such a convenience. Consequently the hygienic welfare of the whole community is being substantially improved, and a far higher level of health secured. The scientific experiment, which was in many quarters hailed as merely a fad and a danger to the borough, has proved a remarkable success; and such municipal means of cheaply manufacturing what is now recognised by the scientific and hygienic faculties as a powerful disinfectant eminently suited to public requirements might very advantageously be adopted by other similar bodies in all parts of the country where the density of the populated areas, more especially in the poorer quarters, constitutes a constant serious menace to the safety of the whole of the inhabitants within the town or city boundaries.

THE THREE-ARMED BUDDHA.

CHAPTER II.

IT was an hour later. The folding-doors of Petersham Mansions stood wide open, the lamp in the entrance-hall had been lighted long ago, and Mr Baynes—affable, middle-aged, inclined to corpulence, and with the manner of a duke retired from business—was 'taking the air' on the steps, when a well-dressed man came up to him and asked to be directed to Mr Frank Denaby's flat.

'Mr Denaby is from home, and won't be back till morning,' replied Baynes. 'But if you like to leave any message for him'——

'Thanks; but I'll call again in the course of to-morrow,' broke in the other, and with that he made off like a man in a hurry.

Ten more minutes went by. Baynes had retired to his 'den,' as he termed it, in the hall, whence he could command a view of all who entered or left the Mansions. To him, as he sat there intent on the sporting news of an evening paper, there now came another stylishly dressed man, who, in brisk, business-like tones, said, 'I see that you advertise one of your flats on the fourth floor as being to let. As I think it may possibly suit my requirements, I should like to go over it, if the hour is not too late for me to be permitted to do so.'

'Not too late, sir, by any means,' replied Baynes, who was allowed a commission on every tenant he succeeded in securing. 'I shall have much pleasure in showing you over the suite in question. There's a splendid outlook from the windows.'

So presently the lift took the pair of them up to the fourth floor.

They had not been gone longer than a couple of minutes before one of the outer doors, which Baynes had shut before going aloft, was gently opened, and a third stranger made his appearance. Over his evening clothes he was wearing a black Inverness cape. After a comprehensive glance around—the lift-boy had been gone some time—he went up to a board on the wall which recorded the names of the various inmates of the Mansions, together with the number of the flat occupied by each. With a finger he ran down the list of names till he reached the one opposite No. 13. That done, he crossed the hall to the janitor's 'den,' went inside, and from among sundry other keys hanging in a row on numbered hooks he took the one under No. 13. It was the duplicate key of Frank Denaby's flat. In the hall he paused for a moment to listen. His confederate and Baynes were still on the fourth floor. Then, carrying the key, he bounded up the staircase almost as noiselessly as a cat could have done, and without halting on the first floor went swiftly up to the second. By the light of the electric lamp in the corridor it was the work of a few seconds to find the door of No. 13. Half-a-minute later he was inside the flat.

Transferring the key from the outside to the inside of the door, he softly turned it and locked himself in. The room was in darkness save for a dull glimmer from the dying fire in the grate; so he struck a match on the box he carried, sought for and found the electric button, and a moment later had switched on the light. He had hardly done so before the silence was broken by a soft, whirring noise, which he rightly interpreted as that made by the lift on its descent from the fourth floor, and he chuckled as he listened. So far all had gone well.

He now took a comprehensive survey of the contents of the room. He was standing with his back to the fire, and it was not till he turned that he perceived the image on the chimneypiece, and at once he pounced on it.

'So this is the josser, is it,' he said, as he turned the bronze over and over, 'that Mr Chundra Das is willing to pay two hundred pounds to obtain possession of? Some folk have queer fancies, and no mistake! For my part, I should be sorry to offer five quid for him, though he may be worshipped as a god in his own country. Anyhow, he's a stupid-looking old cockatoo.' He spoke half-aloud, as men

who have undergone a long term of solitary confinement are said to get into a way of sometimes doing when alone.

He put back the image and indulged in a long yawn. 'Snakes alive, how sleepy I feel after last night's adventure! There's no hurry for an hour or more. Mr Frank Denaby won't be back till morning, so the porter told Chidley, and I may as well make myself comfortable while the chance is mine. So kind of you, Frank, to leave out the drink and the weeds—just as if you expected me to look you up! You do me proud, dear chappie, and I shall have much pleasure in drinking your health.'

After removing his hat and cape, he mixed a stiff tumbler of grog, and swallowed half its contents at a draught. Then he took up the box of cigars. 'San Diegos, as I live! I'm in luck's way,' he said as he read the brand. Then he sat down in one of the easy-chairs by the fire, which still kept up a smouldering glow, and proceeded to light his cigar. His replenished tumbler was within reach.

As he sat smoking, with outstretched legs and with his shoulders resting against the cushioned chair, he yawned more than once. More than once his eyes closed, and he came back to consciousness with a start. But after a few more minutes his lids opened no more. He had sunk into a deep sleep, holding his half-smoked cigar between his fingers.

Mr Dick Frinton—known among his American confederates by the sobriquet of 'Fly-by-Night Dick'—was in his thirtieth year. Tall, thin, lithe, and alert, there was something markedly feline in his movements, more especially so when he was engaged in any of his nefarious transactions. Four persons out of six would have accounted him a pleasant-looking and fairly handsome man; the remaining two, being gifted with more discernment, would have averred that his light-blue eyes, at once shifty and furtive save when he was in one of his genial moods, were set too closely together, and that the habitual expression of his thin-lipped mouth was one of mingled craft and plausibility.

He was the son of a well-to-do country solicitor. For four years he filled the post of junior clerk in a provincial bank; then a way of defrauding his employers suggested itself to him, and he yielded to the temptation. For the next six months he led a gay life in Paris on the proceeds of his fraud, following on which came his arrest, his trial, and his sentence. On his release from prison he crossed to the States, and there before long he joined one of the most notorious gangs of safe-burglars between New York and San Francisco; but at length the Old Country had drawn him back.

One reason why he did not at once secure what he had come for and take his departure was because he knew that an hour later the night-porter would come on duty, when nothing could be more simple than for him (Frinton) to walk downstairs and so out of the building unchallenged, on the assumption that he was a visitor who had been admitted by the day-porter.

One, two, three hours passed, and then, had Frinton not been so soundly asleep, he would have been conscious of certain vague, faint, intermittent sounds, seemingly coming from no great distance away, which might well have aroused his curiosity to ascertain whence they originated and to what cause they were due. But he slumbered on and heard nothing. In a little while, save for the ticking of the clock on the chimneypiece, silence reigned once more.

When three or four minutes had passed thus, one of the folding-doors that gave upon the bedroom moved noiselessly on its hinges, and through the opening the black-bearded visage of Ruffo Rupini was cautiously protruded. For a full minute he remained motionless, his keen black eyes, after roving about the room, concentrating themselves on the chair by the hearth in which Frinton slumbered. The back of the chair being towards him, all he could see of the sleeper was the crown of his head. As he stood glaring at his intended victim an evil smile lighted up his swarthy features. It was clear that he mistook the man in the chair for Frank Denaby.

Inch by inch he advanced till he stood fully revealed. Then, after drawing a long, deep breath, he began to steal forward step by step, his body bent, his shoulders hunched, and with his right hand clutching something held behind his back. But at the fifth step the telephone-bell rang sharply, and on the instant he recoiled as if he had been shot, and vanished through the folding-doors.

As he did so Frinton sprang to his feet, his hand going instinctively to the hip-pocket that held his revolver. But next moment he recognised where he was and the nature of the interruption. 'Yep! it's close on midnight!' he exclaimed, with a glance at the clock. 'What a woolly-brained idiot I must have been!' Then the bell rang again.

Crossing to the instrument, he took up the receiver and blew through it.

'Who are you, and what do you want?' he asked.

'I'm *The Pharos*. Are you Frank Denaby?'

'That's me. Fire away,' was the reply. He had to trust to chance that the difference between the two voices would pass undetected.

'Be here not later than eleven in the morning. Special.'

'Right you are. Won't fail. Good-night.' He listened for the answering 'Good-night,' and then hung up the receiver. But on the instant he became aware through the glass of the overmantel of a stealthy figure creeping up behind him, and he faced round like a flash. As he did so the Italian made a spring, and the knife that was intended to be driven home in Frinton's back buried itself in his shoulder. With an execration, Rupini fled by the way he had come, but as he reached the folding-doors Frinton's revolver cracked out; there was a sharp scream, and the Italian disappeared. Fly-by-Night Dick stood for a few moments

staring after him, then the revolver dropped from his relaxed fingers, and he sank to the floor, a limp heap, and for a time knew nothing more.

CHAPTER III.

IT was close upon six o'clock in the morning when the motor-car which had brought our two friends back after the ball at Minden Lodge drew up at Petersham Mansions, where Denaby alighted, after arranging to meet Brandon later in the day and dine with him at the 'Savoy.' Janson, the night-porter, admitted him in response to his ring, and, after bidding the man good-morning, he ran lightly upstairs, for the lift-boy did not come on duty till an hour later.

His mood just then was one that was wholly strange to him. He was at once exultant and sad, lifted out of his ordinary self, while yet low down in his heart, faintly but clearly audible, sounded the tocsin of despair. Elsie Deighton had met him as if they had parted the day before. She had favoured him with three dances, and had been sweetness itself to him; more than that, he had read something in the depths of her eyes which thrilled his soul with rapture. Therefore it was that he was carried out of himself, while fully aware of his folly and of the hopelessness of a passion to which his honour forbade him to give expression in words. For Miss Deighton was the daughter of a rich man and an heiress, while he was merely a poor journalist with no prospects worth considering.

They had first met when Denaby was a young man about town, with a liberal income and brilliant prospects. He had at once fallen in love with Elsie, and had been on the eve of proposing to her when the news of his father's death reached him; following on which had come the discovery that the elder Mr Denaby had died a ruined man, the victim in part of his own folly and in part of the roguery of others. From then till now Frank and Miss Deighton had not met again.

His thoughts were full of her as he ran upstairs this morning. At the door of No. 13 he halted, produced his key and tried to insert it into the lock, but found that he was unable to do so. After two more attempts he stooped and peered into the orifice, only to discover that it was blocked from the inside, the key having been left by Frinton in the lock.

Wondering much and vaguely uneasy, Denaby passed onward to the side corridor out of which his bedroom opened. His key fitted the locks of both doors, and he turned it without difficulty in this one. A cold air struck him on entering. It came from the bathroom beyond, and on looking he was surprised to see the window wide open, for he had no recollection of having left it so. After partially closing it, he passed back through the bedroom and thence into the sitting-room, but on the threshold he halted, frozen with amazement.

Although it was now broad daylight, the curtains were still drawn and the electric light flooded the room. Facing him, on one of the big chairs by the hearth, reclined a man—a stranger—with a face of extreme pallor, and with a big crimson patch showing on the front of his shirt where he had torn open his coat and vest. On a chair near the outer door lay an unfamiliar hat and cape. The man was regarding him as curiously as he was regarding the man.

After pausing for a few moments to ask himself whether he was not dreaming, Frank drew a long breath and went forward a few steps into the room. 'Who are you, and what is your business here?' he asked.

Frinton paused for a moment before replying; then, pointing to the spirit-stand on the table, he said in a weak voice, '*S'il vous plaît, monsieur.*'

So Denaby poured into a glass a modicum of brandy, and was about to add water to it, when the other's exclamation of '*Pas de l'eau, monsieur,*' arrested his hand.

Frinton took the glass from him and swallowed the neat spirit with feverish eagerness. At once it seemed to revive him, and, grimacing a little, he contrived to raise himself into a sitting position.

'And now you will perhaps be good enough to answer my questions?' said Frank sternly.

'That, under the circumstances, some explanation is due to you, Mr Denaby, I frankly admit. As for who I am, that matters nothing, because you and I are strangers, and after to-day are likely to remain such. As for my reason for intruding upon you, that's another affair. To state the case baldly, I am here on a little matter of business.'

Frank's wonderment was in no wise lessened by these words. 'But who had the impudence to admit you to my rooms during my absence?' he asked.

'I had the impudence to admit myself. The doorkeeper being absent from his post, I took your key off its nail, walked upstairs, and let myself in. It was very simple.'

The fellow's coolness brought Frank's blood to simmering-point. Before trusting himself to say more, he drew back the curtains of the two windows and switched off the electric light.

'And what happened after that?' he asked as he went back to the hearth.

'Oh, I made a great ass of myself,' replied Frinton with a curl of his thin lips. 'But I suppose we all do that at times. Your whisky was tip-top, your smokes were spiffin', and your chairs, with their feet on the hearthrug, had a sweetly inviting look. The consequence was that before I knew it I was in the land of Nod—I hadn't been in bed for two nights and a day—and I didn't open my eyes till three hours had slipped away. And what do you think it was that awoke me then?'

He looked at Frank, but the latter remained grimly silent.

'Why, sir, your 'phone-bell. So, as you weren't

here, I took off the message for you. You're wanted at *The Pharos* Office at eleven sharp this morning, and don't you forget it.' He paused and held out his glass with a significant gesture.

'And what happened next?' asked Denaby, as he poured out a small quantity of brandy. His amazement was growing apace, but he saw that his strange visitor was in no condition to be hurried. He must be allowed to take his time and to tell his story in his own way.

'What happened next was this: a man, grasping an ugly-looking knife, suddenly made a dash at me out of the inner room, evidently intending to stab me in the back; but I turned in time and his knife took me in the shoulder instead. He stared me in the face for a moment and flung up his arms. It seemed to me that he had mistaken me for somebody else—probably for you, Mr Denaby. But by that time I had whipped out my revolver—there it is, under that chair—and as he was bolting through the doorway I fired. He let out one yell and was gone, after which I recollect nothing for a long while.'

He drank off the brandy and resumed: 'When I came to my senses I was in great pain, and found I had bled a lot. By-and-by I managed to lift myself into this chair, and here I've remained ever since—waiting for what might happen next, and not being able to get away, as I had intended doing. Yes, Mr Denaby, I think there's no doubt that the stab in my shoulder was intended for you. Possibly I've been the means of saving your life. In any case, I hope you won't forget the old saying that one good turn deserves another.' As he ceased he bent his eyes on Frank with an evident anxiety in them which he tried to veil under a cynical smile.

Denaby's face had turned nearly as white as Frinton's as the latter told of the attack upon him. That Rupini was the assailant was hardly open to doubt. Had not Brandon dragged him away, almost against his will, in all likelihood he would have been a dead man by now. After a brief silence he said, 'You have told me much, but you have not yet explained the reason of your surreptitious visit to my flat.'

Before the other could reply there was a sound of voices on the landing outside, which was followed by a knock at the door. Frank crossed, turned the key, and opened the door, revealing Baynes, who by this time had come on duty, accompanied by a policeman.

'Beg pardon, sir,' said the former, 'but the body of a man shot through the lungs has just been discovered on the pavement of the court on which the back windows open; and as a gold match-box, with your name inside, has been found upon him, the constable here wants to know whether you can throw any light on the affair.'

'Is the man dead?' queried Frank.

'As a door-nail, sir.'

But at this point the constable, without a word, pushed past Frank into the room. He had caught sight of a pallid, limp figure reclining on an easy-chair, whose shirt-front displayed a big smudge of blood.

Before he could ask a question Frinton, who had heard what passed at the door, spoke, as if anxious to anticipate anything Denaby might think well to say. 'I can throw some light on the affair,' he said in clear accents. 'Last night I called upon my friend Mr Denaby on a matter of business. Learning that he was from home, I obtained the key of his room in order to write him a note, which he would find awaiting him on his return. I had written the note, and was on the point of going, when a man, who must have been in hiding, rushed upon me from the inner room. His right hand held a dagger of some sort, and with it he made a desperate lunge at me—the proof of which you can see for yourselves. In a twinkling I whipped out my revolver, and as he was disappearing through the doorway I fired. After that I fainted, and that's all I know of the affair.'

By this time the constable was busy taking notes. After a pause he said to Frinton, 'Your shot seems to have cooked the rascal's goose, sir. As your presence will be required at the inquest, I must ask you to furnish me with your name and address.'

'My name is Spencer Montague. As for my address, at present I have none. You see, it's only twenty-four hours since I landed at Liverpool from New York. But for this confounded mischance, my address for a week to come would have been Morley's Hotel; now it will most likely be the nearest hospital. My friend here was on the point of summoning a doctor when you appeared, and till I've been examined I can give you no further information. Anyhow, I'll leave word with Mr Denaby where I may be found.' His voice faded into indistinctness and he again pointed to the spirit-stand.

Baynes and the constable left the room.

'I will order a doctor to be fetched at once,' said Frank as he poured out another modicum of brandy.

'No, not yet—if at all,' was the reply.

The young journalist's perplexity was by no means lessened by what had passed in the course of the last few minutes.

As if divining what was fermenting in the other's mind, Frinton now said, with a whimsical smile, 'At length, *mon cher monsieur*, you shall have the explanation to which, were it only for the sake of your hospitality, you are so amply entitled. The point is, where shall I begin?' He sipped his brandy thoughtfully.

'You can't begin better than by explaining what brought you here in the first instance,' said Frank with a sternness that was rare with him.

'Perhaps that will be best. Well, then, in a few words, my purpose in coming here was to despoil you of that bronze gimcrack on the chimneypiece.'

'Of the three-armed Buddha! But who on earth'—— He paused, and his eyes expressed the amazement he felt.

'Ah, that's where the conundrum comes in. I was nearly as much surprised as you are when Mr Chundra Das, an Indian gentleman at present staying at the Dynevor Hotel, offered me two hundred pounds if I could succeed in transferring the image from your keeping to his. But I've failed through an accident—not to speak of my own blazing folly in going to sleep. *Voilà tout.*'

If enlightenment had come to Frank on one point, it had left him with another riddle to solve.

There was a pause, which Frinton broke by saying, 'If it was worth the Indian gent's while to offer me two hundred pounds to steal the bronze for him, it seems clear that, for some reason or other, he must set a much higher value on it than that. Such being the case, may it not be advisable on your part, Mr Denaby, to find some more secure place for it than your chimneypiece? Although *my* attempt has failed, others may be made to obtain possession of it.'

'You are right, and I will see that it is at once put into safe keeping. You have been very frank with me, and in so far I am obliged to you. And now you will let me send for a doctor?'

'Bide a wee, as our Scotch friends say. If, on the one hand, Mr Denaby, I took the liberty of representing myself to that chump-headed "copper" as your friend, on the other I've borne the brunt of a murderous attack of which undoubtedly it was intended that you should be the victim; consequently I think we may cry quits so far as any obligation on either side is concerned. *Que dites vous, monsieur?*'

'So be it. You have unwittingly done me a greater service than you are aware of.'

'I'm glad of that. It will be something to look back upon in my shady record. And now it's high time for me to scoot.'

'But'——

'No, I'll see no doctor here. The police may come again, and put further questions to me which I might find it awkward to answer with a due regard for veracity. So, if you will be good enough to have a cab ordered, I'll sling my hook without delay.'

Five minutes later Mr Dick Frinton was helped into the lift by Baynes. A cab was waiting at the door. His last words to Frank were, 'Take my tip, Mr Denaby, and look carefully after that three-armed josser.'

As Frank stood by the fireless grate after the other's departure, a tangle of thoughts began to unravel themselves in his brain. The fact that Rupini was dead was what impressed itself most forcibly on his consciousness just then. Tragical as the man's end had been, it was impossible that Denaby should feel otherwise than relieved by the certainty that he had nothing more to fear from him. He was too well acquainted with the Italian character not to be aware that even if Rupini had failed in his first attempt, he would have tried again and yet again till he should either have succeeded in accomplishing his purpose or have been arrested and imprisoned for attempted murder. With such a man, the fulfilment of his vow would have all the force of a sacred obligation. That Denaby should experience a sense of relief not far akin from elation as he thought of these things was not to be wondered at.

After a time his musings took a turn. Was the strange story told by the man who had lately left him true or false—that he, Spencer Montague (as he called himself), had been offered two hundred pounds to steal the image of the three-armed Buddha? It was hard to believe; yet what would the fellow have gained by inventing such a rigmarole? He must have had some definite object in view in risking his liberty by his surreptitious entry of the flat, which held nothing that would repay an ordinary burglar for his trouble. The affair was a mystery, and such it would most likely remain. For all that, he would follow the advice which had been proffered him, and place the image in secure custody till he should be able to relieve himself of it by handing it over to his uncle. Fraser, his neighbour in the next flat, with whom he sometimes smoked and played chess of an evening, had a safe in his room, and he would ask him to lock up the image in it for the time being.

So much had happened in the course of the last hour that from the moment of his entering his flat the image of Miss Deighton had passed clean out of Denaby's thoughts. But now, while he waited for his breakfast to be brought up, his mind leapt back to the point at which his cogitations respecting Elsie and his own future were abruptly put an end to. Despondency held him in its chilly grip, for your genuine lover is a being of many moods. Last night he had tasted an exquisite pleasure such as he could look forward to experiencing only once more in his life. Mrs Lennox, who would be in town in the course of a few weeks, had promised to send him a card for her first At Home, and had extorted from him a promise to be there, telling him at the same time that Miss Deighton would accompany her to London. Well, having promised, he would of course go. It would be his unspoken farewell to Elsie. After that he would go back to the obscurity from which he ought never to have let himself be tempted to emerge. Precious memories would still be his; for the rest, Work must henceforth be his mistress. Mayhap she might prove his comforter as well.

Eleven o'clock found him at *The Pharos* Office, looking as bright and alert as ever he had done.

(To be continued.)

THE GORDON HIGHLANDERS IN SPAIN.

PART II.

'ON the 24th, Monday, the Spanish General was surprised to find that the French had left their position. He now marched to pursue them and drive them out of Madrid, and fight them wherever he could find them. Sir Arthur explained that the British had no provisions, and that we could not move until these were supplied. But the Spaniard was obstinate, and crossed the river after the French; he was to do great things with the Spanish army since he got the French on the retreat. This day we waited patiently for a supply of biscuit, but none came. In the evening two pounds of beef each man were served out; this kept us cooking most of the night.

'25th.—We advanced to the Alberche and moved a division of cavalry and foot, under command of General Sherbrooke, across the river, to keep communication with the Spaniards and Sir Robert Wilson's division of Portuguese, who were far advanced on the road to Madrid, to our left. This division occupied the position the French had retreated from at Casalegas. We then returned to our old ground, and sent out parties in search of bread or wine, others being sent to gather wheat and peas in the fields. Very hard times these. In the evening our foragers returned, and brought a mule with two skins of good wine and some bread. This was distributed among the company.

'News reached us that General Cuesta and his Spaniards were in full pursuit of the enemy as far as Torrejos, and that Marshal Victor had gone on the Toledo road, where he was joined by General Sebastiani and his army. At this place the French, hearing that the British army was still at Talavera, faced about on the poor Spaniards. On the 26th news arrived almost every hour from the Spanish army that they had been attacked and beaten with great loss, and were retreating in confusion. I saw one of our officers who had been as far as St Olala; he stated that the streets of that town were entirely blocked up with the Spanish artillery, bread-wagons, baggage, &c., and that whole regiments were running like a rabble or a mob. We began to hear a cannonading at a distance, rolling nearer us.

'On the 27th the Spaniards began to arrive; they took up the ground on our right, in two lines, and entrenched themselves and made batteries on the high-road leading from the town to the bridge over the Alberche, and planted their heavy cannon in front of a chapel at our right. We expected a general attack, and our line was drawn between the river and the hill, a distance of about two or three miles. General Sherbrooke was called in from Casalegas, and General M'Kenzie was stationed with a strong advanced-post at some houses in a wood. I was sent with a working-party to raise a battery on some rising ground among the olive-trees. About two o'clock the French arrived at the side of the Alberche, and opened fire on our advance-guard, fording the river at the same moment. We kept them in check; but from where I was I could see that our people were suffering much, and retiring to take up their position in the line. The working-parties were ordered to stand to their arms, as the shot from the French was coming thick among us. We were then ordered to join our regiments as quickly as possible, and we joined our battalion on the side of the hill to the left of the line. A dreadful cannonade commenced on the British right, and the enemy attacked the Spaniards with their cavalry, thinking to break their lines and get into the town; but the Dons repulsed them manfully. The firing ceased on the right after dark, when the French had made a charge of infantry without success. From the place where we stood we could see every movement on the plain.

'At this time our brigade got a biscuit each man served out, when a cry was heard, "The hill! the hill!" General Stewart called out for the detachments to make for the top of the hill, for he was certain no regiment could be there so soon as we. Off we ran in the dark, and very dark it was; but the French got on the top of the hill before us, and some of them ran through the battalion, calling out, "Españioles, Españioles," and others calling, "Allemands." Our officers cried out, "Don't fire on the Spaniards." I and many others jumped to the side to let them pass down the hill, where they were either killed or taken prisoners in our rear. I saw those on the top of the hill by the flashes of their pieces; then we knew who they were; but I and many more of our company were actually in rear of the French for a few moments, and did not know it until they seized some of our men by the collar and were dragging them away prisoners. This opened our eyes, and bayonets and the butts of our firelocks were used with great dexterity—a dreadful mêlée. The Twenty-ninth Regiment came to our assistance, charged, and kept possession of the top of the hill. This regiment lost a number of men on the highest point of the hill, where the French had a momentary possession, and affairs hung in the balance ere it was decided who should have this key of the position. The enemy tried it a second time, coming round the side of the hill; but as we knew who they were, to our cost, a well-directed running fire, with a charge, sent them into the valley below, their drums beating a retreat. General Hill's division arrived, with two guns, after the affair was over, and, I was told, got credit for this hard contest, when they were dragging their guns about the foot of the hill and did not

fire a shot here until next morning. The firing ceased on this point before eleven o'clock; all was silent on the plain long before. Our brigade got into formation as well as it could, with our left to the top joining General Hill; a deep ravine or hollow was to our front. Some other regiments came on the side of the hill and formed a second line, and some guns were posted to the right of our brigade. I believe it was only after nightfall that our Generals found the importance of this post. We got ammunition served out, and had time to count our loss, which was very great. Vedettes were placed a few yards in front, and we sat down in the ranks and watched every movement of the enemy. About one in the morning we could hear and see the French moving their artillery on the other side of the hollow about two hundred yards from us. Some firing commenced; it ran from the left to the right, for we could see every flash in the plain below us. Order was restored, and a death-like silence reigned among us. The French kindled great fires in rear of their lines. I had a sound sleep for a short time, being one of those who could sleep half-an-hour or twenty minutes at any time or place, and feel myself much refreshed.

'28th.—As daylight appeared each army gazed on the other and viewed the operations of last night. Round the top of the hill many a red-coat lay dead; about thirty yards on the other side the red and blue lay mixed, and a few yards farther, and down to the valley below, they were all blue. The French fired one gun from the centre as a signal for all their line to commence action. Their guns began to pour grape-shot and shell into our lines, and three columns came bearing for the hill. We were ordered to lie close to the ground, but when the enemy was about fifty yards from us we started to our feet and poured in a volley, then charged with the bayonet, and ran them down into the valley, cheering, and firing upon them, for they proved better runners than we. They retreated across the valley to our left, leaving many killed and wounded behind them, and some ammunition-wagons, from one of which I took two three-pound loaves of bread. This was a noble prize where there were so many hungry men. We were ordered to pursue no farther than the rising ground at the foot of the left side of the hill. They crossed the valley and formed on some rocks on the other side, and threatened to turn our left. Two Spanish battalions were sent over to them, which kept them in check, and they kept up a popping fire at each other most of the day. Our guns on the top and side of the hill kept blazing away upon the French guns and columns within reach.

'After the attack was over here, we heard some heavy firing down on the plain among the olive-grounds, but from where we now were we could not see what was going on; the Forty-eighth Regiment and some others were withdrawn from the hill to the plain. About eleven o'clock the enemy, being baffled in all his attacks upon our lines, withdrew his troops a little. As we did not move to follow them they deliberately piled arms and set about kindling fires and cooking their victuals. A brook ran through the plain; to it both armies went for water as if truce was between us, looking at each other, drinking, and wiping the sweat from their brows, laughing and nodding heads to each other; all thoughts of fighting for the time being forgotten. Water was in great demand by our brigade, and parties were sent off for it; others were sent to bury the dead that lay thick about us, and to assist the wounded to the rear.

'Our brigade took up the ground it had quitted in the morning, and the Forty-eighth and Sixty-sixth Regiments took up our ground, for we expected the enemy to make another brush for the top of the hill, and in this we were not deceived. About one o'clock the French army was in motion again, and three divisions were on their way to the hill, one on each side, the other to the front. Our guns on the hill opened upon them, but did little execution to what we expected; it was said, "They are the German Legion artillery." The enemy's right division got under shelter of a large house in the valley, where they stood in close column and sent forward their sharpshooters to within a few yards of us. At this time the British cavalry entered the valley to check the French right. The Twenty-third and German hussars formed across the valley, and, supported by the heavy dragoons, charged the right division of the enemy. This charge, though nobly executed, had not the effect intended, for the French opened a steady fire upon them, killed and wounded and took many of the Twenty-third Light Dragoons prisoners, and forced the remainder back on General Anson's heavy brigade, which kept this division of the enemy from advancing any farther. We stood looking at the affray for a few moments, until General Stewart's brigade was ordered to advance to the top of the hollow, when all the others were ordered to lie close to the ground, as the French had taken up a position with their heads above the rise, and were doing much mischief. We sustained a heavy fire from the enemy's guns on the other side of the hollow, which were making lanes through us, and their musketry attacked us on our flanks. We cleared the enemy from our front and right, but they maintained the heights on the other side; and, as we were lower than they, they punished us severely. All the other troops were brought into action, and the battle raged along the lines from right to left, and nothing could be heard but the long roll of musketry and the thunder of the artillery intermixed. Captain M'Pherson of the Thirty-fifth Regiment, who commanded our company this day, was down, and my right file was taken off by a cannon-shot. William Bowie and John Shewan were killed on my left, and Adam Much lay in the rear, wounded.

'About four o'clock I was struck by a musket-ball, which grazed my left knee and passed through

my right leg about two inches below the cap of the knee. I finished my loading and fired my last shot at the man who wounded me, for I could plainly see him on a height a few yards to my front; I think I should have known him if he had come in my way afterwards. I called out to Sergeant John Gordon that I was wounded; he was the only non-commissioned officer belonging to the regiment I saw at his post. I made along the side of the hill as well as I could, using my firelock as a crutch. I looked back at the brigade, and saw it was much cut up. I passed Colonel Alexander Gordon, formerly captain in our regiment, killed; and Brigade-Major Gardener, who had been an active officer of our brigade all morning—he and his horse lay dead together; Major Ross, Thirty-eighth, and Captain Bradley, Twenty-eighth Light Company (I knew him in the light battalion in Dublin), badly wounded. I stepped over many men lying on the ground here to rise again no more. The shot was tearing up the ground on my left and right, as the French cannon were doing great execution at this time, and their shells had set the corn-fields on fire in the plain, and brush-wood and long grass were blazing on the sides of the hill; and many wounded men, unable to get away, were burned to death. If I had sat down no doubt the same lot would have been mine, so I kept hopping along until I came to a large white house where many wounded men were waiting to be dressed. Here I found the surgeon of the Gordons, Dr Beattie, who came at once to me and dressed my leg and put a bandage on it. He then gave me a drink of water, and told me I had caught it at last. I, smiling, replied, "Long run the fox, but he is sure to be caught at last." This made many smile whose bones were sore enough. I had now time to look about me, and I saw that things were going on in the plain little to our advantage. Some of our guns were drawn to the rear to take up a fresh alignment. Feeling very weak, I took a mouthful of water and a slice of the loaf that I got in the morning, when I found a musket-ball in it, which had pierced my haversack and lodged in the loaf. I sincerely returned thanks to God for preserving me in the dangers to which I had been exposed, and gave myself great credit for all I had done. Thus pleased with myself, I got up and hopped along for the town of Talavera.

'I trudged along in the rear of the line, with some more men in the same condition, for the town, although about this time it seemed rather doubtful whether the French would be there before us. I felt myself getting very weak through loss of blood, and had to make many halts among the olive-trees; and I was vexed to see so many men of different regiments, especially the King's German Legion, skulking in the rear when they should have been doing their duty in front with their comrades—going prowling about with bad intentions, I knew by their looks. And as for the Spaniards, some battalions of them had left the field in mobs during the action; not those actually engaged, but those in the second and third lines. This was disgraceful conduct.

'I reached the town and sat down on the steps of a door, when a young woman brought me a pitcher of water and vinegar, and many a pull I took of it before I let it out of my hands. I then went to the general hospital, a large convent, where hundreds of men were lying in the courts and passages and on the stairs. I lay down and put my head on the dead body of a man of the Sixty-first Regiment, and slept amid all the uproar and bustle. I awakened about dark, and got into one of the large rooms. I saw no one I knew but Adam Much of our regiment, who was wounded about the same place as myself. I lay down beside him. We slept soundly until morning, when I was wakened by the surgeons performing their operations, cutting off legs and arms. I found myself stiff and sore. Dr Beattie came and dressed our wounds. On the afternoon of the 29th Adam Much's wife found him; this was a joyful meeting, as he was supposed to be killed. I got about two glasses of wine from her, which greatly revived me; this was a glass in need, not to be forgotten.

'On the 30th we were carried to the battalion hospital, situated in a church. I got plenty of clean straw, and had one of the steps of the high altar for a pillow, and had some good soup, of which I had much need. Here I learnt the particulars of both armies. The firing was kept up until evening, and we kept our ground and no more on the 28th. Early on the morning of the 29th, when a fresh attack was expected, the French crossed the Alberche and retreated in good order to their old positions. Thus, although commanded by King Joseph in person, and Marshals Victor and Jourdan, and General Sebastiani, with about forty-eight thousand men, they could make no impression on the British lines, and we were the mainstay of the Spaniards. In this action our loss was very great. Generals Mackenzie and Langworth were killed in the field. According to a statement which I saw, the number of killed and wounded was: officers, three hundred and thirty-seven; sergeants, two hundred and eight; drummers, twenty-nine; rank and file, four thousand eight hundred and ninety-two—a total of five thousand four hundred and sixty-six. Of the first battalion of detachments there were above three hundred men killed and wounded. Our company had forty-eight men in the field, of whom six were killed and twenty-four wounded.' *

(To be continued.)

* Omau, in his *History of the Peninsular War*, gives the total British casualties as five thousand three hundred and sixty-three; killed, thirty-four officers, seven hundred and sixty-seven men; wounded, one hundred and ninety-six officers, three thousand seven hundred and nineteen men; missing, eight officers, six hundred and thirty-nine men. The French casualties were seven thousand two hundred and sixty-eight.

CONCERNING THE CRINOLINE.

By WILLIAM ANDREWS.

AT various times in this country there has been popular the fashion of wearing dresses of considerable circumference, extending as much as from twelve to fifteen feet, by means of hoops and crinolines. In the time of Queen Elizabeth the article which distended the dress was known as a farthingale. The last time the crinoline was in fashion was from about 1855 to 1866. It grew to an enormous size, and women who wore it were the butt of the comic journals and the theme of the writers of satire. When the fashion started whalebone was largely employed. The papers published half a century ago are full of paragraphs similar to the following, drawn from the *Leeds Intelligencer* of 29th August 1857: 'Last year the price of whalebone ranged from two hundred and ninety to three hundred and fifteen pounds per ton. This year the Dundee Union Whale-Fishing Company has sold the cargo of the *Jumna* at four hundred and forty pounds, and we believe that now five hundred pounds per ton is the price asked for the two remaining vessels. We doubt not, says the *Dundee Courier*, that the shareholders of our whaling companies all agree in their admiration of the crinoline.'

Naturally, the great demand for the whalebone increased its price, and other and cheap materials had to be introduced to meet the requirements of the classes and the masses. Steel became popular for the purpose, and the fashion kept spreading in every direction. Much inconvenience was caused by women with large crinolines, as they filled so much space in a room or carriage, and often women were burnt to death when their dresses caught fire. We remember our old friend, Mrs George Linnæus Banks, the novelist, author of *The Manchester Man*, &c., telling how she saved several lives by rolling the women on fire in hearthrugs. She was injured in the hand through attempts to put out a fire.

The subject has its amusing as well as its tragic side. In a journal dated 27th August 1857, it is related that a Mrs London arrived at Plymouth from Jersey; and while the vessel was lying at Catwater an ungallant Excise officer caused her extended crinoline to be examined, and two pounds of tobacco were found in her bustle. It was evident by its appearance that the bustle had done its fair (?) owner some service.

We find in the same journal a story from Scotland which was deemed sufficiently diverting to be reported in a Yorkshire newspaper. 'As the river steamer,' we are told, 'was leaving Greenock the other night, on her homeward passage, a young lady got up in the most fashionable style—that is, with an immense superstruction of flounced skirts, supported by an internal and complicated scaffolding of hoops—stepped on board. Unluckily, however, the lowest hoop caught on a projecting timber-head, and caused her to stumble and fall. From this situation she nimbly gathered herself up, and, had it been all, might soon have forgotten the accident. A still worse lot was hers. The strain at the time of the fall had the effect of loosening the strings, tapes, or buttons by which the expanding apparatus was sustained, so that before she had taken half-a-dozen steps the whole came tumbling down about her feet, to her own dismay, but to the delight of all the spectators, who could not refrain from laughing loud and long at the woeful figure she cut after the sudden collapse. The unfortunate sufferer retired to the ladies' cabin, but, we need scarcely add, did not reappear until the steamer had discharged her passengers.'

At Middlesbrough-on-Tees, when the crinoline was popular, the priest in charge of the Roman Catholic Church insisted on charging double pew-rent for those wearing this article of costume.

When the foolish fashion had reached its height, and ladies wanted a change, its decline started in London, but it was some time before it fell into disuse in the country. The writer, then a boy, was residing in the small town of Alfreton, Derbyshire, and distinctly remembers the sister of a curate being the first person to appear at the

 [*All Rights Reserved.*]

parish church without a crinoline. All eyes were directed to her, and she was deemed a lady wanting in modesty to disregard the popular fashion. The women of the place were warm over the offending lady.

The name crinoline is from the French, and is given to a fabric of horsehair of considerable stiffness, which was employed to distend a woman's attire. In later times it was applied to hoops of steel used for the same purpose as the material first in fashion.

One of the earliest forms of the dress distender, as we have seen, was called the farthingale, which was introduced by Queen Elizabeth, and we may regard it as the progenitor of the later fashions of its class. It was made of whalebone, and its chief difference from the crinoline that followed was in the fact that the farthingale protruded more at the waist, so as to resemble a beehive. The size in France was fixed by Charles IX., in the one hundred and forty-sixth article in the Edict of Blois, at not more than an ell or an ell and a half in circumference. The result was that its dimensions increased more and more. The old poets and dramatists have many allusions to the farthingale. Heywood, in his *Micro-cynicon —Sixe Snarling Satyres*, 1599, writes:

> Alas, poor verdingales must lie in the street,
> To house them no door in the citie made meet,
> Since at our narrow doores they in cannot win,
> Send them to Oxforde, at Brodegates, to get in. . . .
> Placing both her hands upon her whalebone hips,
> Put up with a round circling farthingale.

In the *Merry Wives of Windsor* we read: 'The firm fixture of thy foot would give an excellent motion to thy gurt in a semicircled farthingale.'

'When Sir Peter Wych,' says Butler in his *Pedigree of the English Gallant*, 'was sent ambassador to the Grand Seignior from James I., his lady accompanied him to Constantinople, and the Sultaness, having heard much of her, desired to see her; whereupon Lady Wych, attended by her waiting-women, all of them dressed in their great farthingales, which was the Court-dress of the English ladies at that time, waited upon her Highness. The Sultaness received her visitor with great respect; but, struck with the extraordinary extension of the hips of the whole party, seriously inquired if that shape was peculiar to the natural formation of English women, and Lady Wych was obliged to explain the whole mystery of the dress in order to convince her that she and her companions were not really so deformed as they appeared to be.'

The hoop followed, and although no article of costume has been more abused, it long retained its favour among women. In Sir Roger de Coverley's picture gallery, his great-great-grandmother is said to have on 'the new-fashioned petticoat, except that the modern is gathered at the waist.' It may be inferred that the old lady had on the wheel-farthingale, which projected all round, for the knight adds: 'My grandmother appears as if she stood in a large drum, whereas the ladies now walk as if they were in a go-cart.' When the whalebone petticoat was first introduced it presented a triangular rather than a rounded appearance. This was in 1711, and what ladies lost in height they gained in breadth. The style changed, for in 1735 we read of it that it projected all round like the wheel-farthingale. The petticoat was short and without a train. A pamphlet was brought out in 1745 under the title of *The Enormous Abomination of the Hoop Petticoat, as the Fashion is now.*

It was customary to carry garlands at the funerals of maidens in bygone times, and hang them over seats they used to occupy in the church. At South Wingfield, near Alfreton, Derbyshire, remains to this day an interesting example. It was carried at the funeral of Ann Kendall, who died of a broken heart on 14th May 1745. The story of her death is very sad. She was killed by the heartless conduct of her lover, but according to local tradition he did not long survive her death. The grave had only closed over her for a short time, when, as he was riding on horseback past the churchyard, the bells of the church commenced to toll, and the unexpected sounds startled the horse so that it stumbled, throwing him to the ground, and breaking his neck by the fall. The young woman used to dress in a fashionable manner, and always adopted the latest style; and it is still related of her that her hoops were so large that when she attended church she had to pass through the door sideways. The families of the deceived and the deceiver have long been extinct in the parish, but stories of her fall and her foibles of fashion are still told in the old village.

At this period hoops had grown so large as to fill the space of half-a-dozen men. An elongated oval form, we are told, came into fashion, which was raised at both sides to bring into notice high-heeled shoes. The hoops were of whalebone, and had canvas over them. On either side were large pockets. This style caused people to say that a lady looked like a donkey carrying panniers. 'The hoop,' says a contributor to the *Connoisseur* for 3rd October 1754, 'has been known to expand and contract itself from the size of a butter-churn to the circumference of three hogsheads.' He concluded his paragraph by saying: 'At the present time it is nearly an oval form, and scarce measures from end to end above twice the length of the wearer.'

In 1780 advertisements of whalebones appeared in the newspapers. Sixteen years later hoops were no longer worn in private life, but still formed part of the Court costumes. The good taste of George IV. abolished the Court hoop.

A PAWN IN THE GAME.

CHAPTER XI.—TO THE SEACOAST.

THE pace at which the three armies crept down the river fretted Jack's patience sorely. He was burning to catch the first transport sailing for England. But on the third day of the march he learned that a squadron of the Royals and one of the Queen's, with a detachment of infantry, were to be sent forward in haste. Parties of French from Alexandria were raiding the country along the lower reaches of the Nile, collecting supplies, and what cavalry could be spared was to be despatched to check these marauders. The detachment was under the command of the major of the Royals.

'You can ride with us,' he said, 'and you will get to the seacoast a week before the columns do, for we shall travel light and push ahead at speed.'

The detachment started a little after midnight, and for hours the camp-fires behind them flung a crimson glow on the night sky. Presently these died away, and the stars shone clear in the deep Egyptian sky. Then came the many-coloured splendours of an Eastern dawn.

The party pushed on till noon, camped till sunset, and marched again through the night, halting once more when the sun rose. Horses and men were by this time almost worn out. The men were sleeping under the shade of some scattered palm-trees when half-a-dozen Arabs came riding furiously into the little camp with the news that a big French convoy was making for the river a few miles ahead. The major looked round on his slumbering force—the leg-weary horses, their heads hanging down as they stood in the shade, the men asleep in every attitude of weariness.

'Poor beggars!' he said, 'there is not pace enough left in them for a dash. I'll give them a couple of hours more for rest; some of us, meanwhile, must ride out and pick up the enemy.'

He gave a few brief orders, selected the horses that seemed least weary, and, with a couple of orderlies and Gray, mounted. Gray said a few words to him before they started.

The major turned round. 'You speak French like a native,' he said to Jack, 'and the rest of us don't know a word of the language. Come and ride with us. Your horse is the freshest in camp.'

Jack gladly accepted the invitation, and the little party moved off, the Arabs, who by this time numbered several hundred irregulars armed with every variety of weapon, eagerly galloping on ahead. They had ridden for less than an hour when the Arabs came riding back, and with eager gesticulations pointed to a black line clearly visible across the level brown landscape.

'Yes, there are the French,' said the major when he had looked for a minute through his glasses; and putting spurs to their wearied horses, the group cantered forward. When they were within five hundred yards of the French they drew rein. It was a formidable body, not less than seven hundred strong, of all arms, including heavy cavalry, a detachment of dromedary men, and a couple of light guns.

It had no stragglers. A line of infantry, four deep, formed the front of the detachment, and a similar line the rear. On one flank were the squadrons of the dromedary corps, on the other a strong body of dragoons. A huge convoy of laden camels, five or six hundred in number, was in the centre of the moving square. It was an almost perfect example of the tiny yet complete and most effective fighting units which the genius of Bonaparte organised for detached service, and by which he held down Egypt. It was formidable alike for attack and defence.

The major of the Royals whistled as he took in the strength of the French.

'They are too many for us, by Jove! It would need guns and infantry to break them up.'

Then he looked at the swarm of Arabs about him. 'We'll get them to hang on to their flanks and harass them. This will, at all events, serve to keep down the pace until our men come up.'

With much trouble, and with the help of Jack, who acted as interpreter, the Arabs were persuaded to gallop past the flanks of the French and open fire upon them with their long guns. But the French commander was a veteran familiar with the methods of desert warfare. A fringe of tirailleurs ran out from the square, a spray of little active figures, who opened out at regular intervals, and knelt or fell at length on the ground and fired. They were cool and deadly marksmen, and the Arabs promptly drew off, leaving a dozen of their number stretched on the sand. The major of the Royals by this time was looking back through his glasses towards the camp he had left for his squadrons.

'If they come they are not strong enough;' and his eyes dwelt angrily on the compact and orderly mass of the French, whose quick step had not been arrested a moment by the attack of the Arabs. 'They will slip through our fingers,' he said with an expletive.

'Why not try a game of bluff?' Jack suggested. 'If you give me leave, major, I will carry a white handkerchief down to the French and summon them to surrender before your main body comes up.'

'That will be cheeky, but perhaps it is worth trying.'

'Let me ride down to their lines!' said Gray eagerly.

'But you don't know a word of French.—I must reckon you as one of my staff, Mr Lawrence, and send you down.'

The major lent his pocket-handkerchief. Jack tied it to the end of a spear borrowed from one of the Arabs, and, putting spurs to his horse, he cantered down to the French lines. More than one tirailleur fired at him as he came near, and the bullets whistled unpleasantly close; but he rode steadily on. Presently a French officer, followed by an orderly, rode out of the main body to meet him. He wore the uniform of a colonel; his deep-lined face and grizzled hair showed he was a veteran.

Jack had pulled up his horse less than a hundred yards from the French. The detachment halted, the dragoons dismounted, the men of the infantry threw themselves on the sand, and every face was turned towards Jack. Something in the look and attitude of the French struck him. In physique and equipment they were soldiers of a formidable type, but they hardly wore the countenances of men on the eve of battle and eager for it. He knew the French were heartily tired of Egypt, and he resolved, if he could, to play on that chord.

The French colonel had pulled up while yet at a distance of a dozen yards.

'I come, monsieur,' said Jack, 'to propose that you surrender to the British. Our columns are advancing against you; resistance will be useless, and on grounds of humanity we offer you permission to go to France after laying down your arms.'

As he spoke the words '*revenir en France*' Jack raised his voice so that they rang over the whole detachment. He saw a stir in the lines as the words swept down to them. Some of the men began to gesticulate.

The French colonel broke out into a torrent of angry speech.

'We know our duty,' he cried; 'it is to fight. Your proposal is a dishonour to us. I shall order my line to fire upon you if you do not at once withdraw.'

'The offer of a passage to France is no dishonour,' said Jack, and again he raised his voice on the '*revenir en France.*' 'You will sacrifice your men in refusing it.'

A fierce gesture was the Frenchman's reply, and Jack turned his horse round and rode slowly away; but he felt sure the incident was not yet closed. Presently he heard the sound of a horse's feet behind him. He turned.

A French aide-de-camp was coming up at a gallop. 'My colonel,' he said, 'wishes to hear your proposals again. He must consult with his officers upon them.'

Jack expounded his proposal at length. It was, he explained, the terms which had been granted to the French in Cairo, and which a force thirteen thousand strong had accepted. The aide-de-camp rode back to his commanding officer, and presently a clamour of many voices rose amongst the French. The entire detachment, apparently, had resolved itself into a public meeting, and was debating the offered terms, nearly everybody talking at once. In half-an-hour the aide-de-camp returned with the proposal that the French should give up their camels and baggage, but that the detachment itself should be allowed to march back to Alexandria. By this time the major of the Royals had ridden up to the conference, and the squadrons of British cavalry were in sight.

'Tell them,' he said to Jack, 'I am not such a fool as to allow the forces holding Alexandria against us to be strengthened by so fine a body of men as this.'

The French aide-de-camp bowed at the compliment, but shook his head fiercely at the renewed proposal to surrender. The French colonel now joined the group, his long, grizzled face wearing a very bewildered expression.

'His men won't fight,' whispered Gray to the major.

This proved to be the case; and after an animated debate it was agreed that the French should lay down their arms on reaching the British headquarters, and should be sent in due course to France without being regarded as prisoners of war.

'By Jove, Lawrence,' said the major, with a shining face, when the agreement was completed and the French had peaceably camped, 'this is a big bag! It ought to be worth a step to everybody concerned. And we owe it to your bluff, old fellow.'

The French were indeed a singularly fine body of men, over six hundred in all, including one hundred and thirty dragoons and two whole squadrons of the dromedary corps—men chosen for their activity and daring, the very *élite* of the French army—with a swarm of Arab camel-drivers and an immense mass of baggage and forage.

The Arabs, however, by no means regarded the event with the same complacency as the British. It represented a lost chance both of revenge and of plunder. They rode furiously around the little French camp with brandished weapons and cries of anger. The French regarded this performance grimly, and began to handle their muskets.

'If you can't keep that *canaille* quiet,' said the French colonel, riding up to the major of the Royals, 'we can, and will.'

The major promptly drew a cordon of British cavalry pickets round the surrendered detachment, and by way of soothing the Arabs drew out a hundred of the laden camels as their share of the booty. The British infantry in the meanwhile were coming on the scene, and the major sent Gray at a gallop to stop them.

'Explain to the Frenchmen, Lawrence,' he said, 'that I will not bring up my infantry, as their presence is not necessary;' adding, with a wink, 'I don't want them to see what a handful they are.'

It was night before all details were settled, and the British officers sat by the camp-fire, talking over the event of the day.

'You must stay with us, Lawrence,' the major of

the Royals said. 'You can talk their lingo, and they trust you. It is a ticklish business keeping control of such a body of men—with arms still in their possession and the Arabs buzzing round them like wasps—till the columns come up.' And with a touch of keen regret Jack had to consent.

Two days later the three armies came up, and the major reported his capture to General Moore, who was in command of the British force, making handsome acknowledgment of Lawrence's services. Moore sent for Jack and personally thanked him.

'You are not in the service, and no reward can be offered you, but I shall be glad to report to the Foreign Office the value of the aid you have rendered in this business.'

Jack looked with curious eyes at Moore. Already he had the reputation of being the ablest General in the British service. A great career seemed to await him. No one could foresee how it was to come to a premature end in the fight at Corunna, and to be eclipsed for all time by the fame of a still greater soldier known up to that moment only on Indian battlefields.

At Deroute the order in which the armies marched was changed. The French had to pass to the front in order to reach Rosetta, where transports were waiting to carry them to France. The Turkish force swung off to the right; the British halted, and the French marched past them. It happened that the track at that spot ran through a narrow pass, and the French fell into a long single column as they defiled through it. A cluster of British officers, some mounted, some on foot, stood on the slope of the hill commanding the exit from the pass, and watched the column as it emerged and deployed on a broader front as it reached the plain.

Up to this moment no one in the British army knew exactly the numbers of the French marching in their rear, and the scene they now witnessed was an astonishment for them. For hours the human stream flowed on, foot, horse, batteries of guns with ammunition-carts—no less than fifty guns were counted—the dromedary corps, &c. The men had the look of veterans. The equipment was perfect. The column marched at a quick step, with flags displayed and beat of drums.

'By Jove!' exclaimed one officer who stood near Jack, 'they are three times our number. If they had turned on us it would have been a hard tussle.'

'We should have beaten the beggars, sir,' said a boyish-looking cavalry officer who stood by him, with all the arrogance of youth.

'Yes; but there would not have been enough of us left at the end to be worth sweeping up.'

This was true enough. Moore's force marching in front of the French did not amount to four thousand effective men of all arms. The French, by count of head, numbered thirteen thousand six hundred and seventy-two men, of whom only eight hundred were sick, with another five hundred invalids reported as 'fit for garrison duty.' The French, that is, were practically three times as numerous as the British, and in the event of battle the Turkish army was a very doubtful quantity.

The British officers watching the interminable French column defiling out of the pass at last broke into a shout of honest laughter.

'Nobody ever saw a sight like this before,' said one of them, 'and nobody will ever see a sight like it again. These fellows could eat us up if they only had appetite enough.'

At last the long succession of horse and foot ended. Then came a jumble of baggage-carts and loaded camels, a disorderly troop of six or seven hundred auxiliaries—Mamelukes and Greeks—and then a little company of civilians; the staff of the schools, of the library, of the printing press, of the central bureau, &c., that Bonaparte took with him to Egypt. They seemed oddly out of place in the tail of such a body as had just marched past, and Jack watched them with amused eyes.

Suddenly he started. A Frenchman in civilian costume, mounted on a mule, lifted his face and looked curiously at him as he rode past. It was M. Duclos! Jack had an unforgetting memory for a face, and he was sure that the figure already being lost in the crowd was that of madame's old major-domo. What had brought him to Egypt? He was not a soldier. He had courage enough of a sort, but it was of a dark and subterranean order, and certainly would not carry him of its own impulse into the fighting front of an army. Probably Paris had grown dangerous to him, and he had seized the chance of a civilian appointment in Egypt to escape.

That night Jack had no difficulty in discovering the place in the French camp occupied by the civil staff, and he found M. Duclos sitting alone by a little camp-fire. He looked older; the Egyptian sun had added a darker tinge to his dark face, his hair was sprinkled with gray, but the eyes had their familiar look of craft. He showed no surprise when Lawrence came up. His vigilant eyes had promptly recognised him in the group on the hillside.

'I expected you to come,' he said.

'Why?' asked Jack. 'I certainly owe you no friendly attention.'

M. Duclos shrugged his shoulders.

'There is something you want to know, and you think I could tell it to you.'

'Yes; but I am sure you will not tell it except it suits your own purpose; and I sha'n't believe it unless there is some proof stronger than your own words.'

The Frenchman shrugged his shoulders afresh. 'What is it you want to know?' he asked.

Jack hesitated. What could the Frenchman tell him worth knowing or capable of being believed? M. Duclos read his doubt, and it acted on him like a challenge.

'Do you want to know the truth about that will? It was a trick, as your English lawyers guessed; but it was a trick to defeat a wrong. Madame was

my sister, though we both agreed to conceal our relationship. She was a good Frenchwoman, and served France in the only way a woman could serve her country. She married your father not because she loved him, but that she might serve France better. The marriage gave her a recognised position in London.'

'And she lost it when my father found she was nothing better than a French spy.'

M. Duclos's face grew darker.

'Yes; and why should I not have tried to save her from being punished for her patriotism?'

'Did madame know of the fraud in the will?'

M. Duclos hesitated. 'How can I tell?' he replied sullenly. 'I was willing to take all the risks of the fraud for her sake.'

'I have heard no news from London for years,' Jack said. 'What about Denise?'

The eager voice betrayed him, and the Frenchman looked quickly up, while an evil light came into his eyes.

'I hear about her constantly, and can give you news. She is, like her mother, a good Frenchwoman. She went back to Paris as soon as public affairs grew quiet there, and she is married to a good Frenchman.'

'Married!' cried Jack, who felt his face grow white, while the eyes of the Frenchman dwelt on him keenly.

'Yes; and happily married.'

'What is her name now?'

'I do not think,' said M. Duclos with much deliberation, 'I am justified in telling you. Why should you know? You would only disturb her domestic peace.'

As Jack walked away from the interview the Frenchman's eyes followed him with a look of malign gladness.

'There are better weapons than the sword with which to stab,' he muttered to himself.

Certainly no thrust of sword could have wounded Jack so deeply as the news he had just heard. The one shining hope of his life was blotted out with a word. Married! He shut his eyes, and Denise's face rose before him in all its vivid sweetness. And now it was lost to him for ever!

In the tumult of bitter feeling the whole landscape of his life seemed blackened. It had been better, he whispered to himself, that he had perished in the desert with that hope burning like some clear altar-flame in the innermost chamber of his life than live in the gloom of quenched hope to the end of his days. The sense of loneliness, the bitter consciousness of cheated love, of all sweetest hopes wrecked, overwhelmed him. For hours he walked to and fro in the darkness—the silent camp about him, the silent, star-filled sky over his head, but his own mind a tempest of distress.

Presently he pulled himself together. He could not blame Denise. He could understand how France drew her back as with a spell. And if another had won the priceless treasure of her love, what grounds for complaint had he? No doubt in London they had long reckoned him as dead. 'Happiness,' he said to himself, 'has gone out of my life; only duty remains.' He would go unwedded to his grave. But he would do his work like a man.

Dawn came at last. The camp was awake, the men falling into line, when Gray came up.

'I have been looking for you, Lawrence, and I have good news for you. Some transports are sailing in a couple of days, and they can't refuse you a passage.'

Jack's face, however, did not lighten at the news. He hesitated. 'I am not sure,' he said, 'that I shall go.'

'What has happened?' cried Gray. 'You've been fretting to go for weeks. You have made us all feel that you only endured our society, and longed for a chance of turning your back on us; and now that the chance has come you wear the look of a man who has received the news of the death of his dearest friend.'

'Well, Gray, I have had news more bitter than the death of a dearest friend. England to me just now is not what it was a few hours ago.' Then he reflected a moment. 'Still, I suppose I must go, and you are a good fellow to bring me the news of the transports. No,' he said in reply to Gray's wondering eyes, 'I can't tell you what it is, but it is the worst of news;' and he turned away.

(To be continued.)

HERRENHAUSEN, NEAR HANOVER.

By Lewis Melville,
Author of *Farmer George, The First Gentleman of Europe, The Beaux of the Regency,* &c.

IN the eyes of the inhabitants of Great Britain and Ireland, Hanover is merely a town that has had the distinction of being the residence of a minor German potentate who, owing to his father's choice of a wife and a series of accidents, succeeded in his fifty-fifth year to the British throne; and it comes as a blow to our self-complacency to find that the Hanoverians regard this merely as an incident in the history of their reigning House. Nor is it by them regarded as an agreeable incident! It is true they are pleased to have given a succession of kings to this country, but they do not disguise the feeling that they consider they paid too heavily for the privilege by having absentee rulers for more

than a century; and there can be no doubt that when, on the death of William IV., his brother Ernest Augustus, Duke of Cumberland, became resident King of Hanover, and that state thereby severed its connection with Great Britain, there was general rejoicing. This shows a want of gratitude, for Hanover by its association with this country gained greatly not only in influence but also in territory; but, as a matter of fact, the inhabitants of North Germany did not suffer foreigners gladly then any more than to-day, when a stranger is looked upon with dislike by the people.

This is not the only disappointment that the British visitor has to sustain. He has probably remembered that Thackeray, lecturing on the Georges, remarked that Hanover was then very much as it was in the days of George Lewis; and, forgetful of the passage of time, he has anticipated the pleasure of finding a quaint, old-fashioned town. Alas! it has been 'improved' out of all recognition; it has a quarter of a million inhabitants and all the conveniences of the most up-to-date German cities. Modern Hanover, indeed, is doubtless to the residents most delightful, but it is planned on a scale so elaborate that the visitor is justified in regarding it as a toy-town; and even its most stalwart defenders cannot deny that its pretentiousness may justify a smile.

From north to south, from east to west, it is invaded—ay, and conquered—by the spirit of bureaucracy, and this is everywhere evident in the buildings. The Government offices and official residences of this town with its quarter of a million inhabitants are almost as large as the London structures that house the departments of the Secretaries of State whose sway extends over the British Empire; the new Town Hall, with the adjacent Water Board, covers an area nearly equal to that of the projected London County Council Hall; and there are two museums, each about the size of the National Gallery, though—the truth must out—the really *valuable* contents might be placed in two or three small rooms. There is (in addition to other places of amusement) a Court Theatre larger than Covent Garden; there are several immense hotels, more than two score restaurants and cafés about the size of Prince's; the station has a frontage broader than Euston, and the main post-office is an imposing pile; while the banks, merely local offices of concerns in larger cities, are built apparently to the scale of the West End branch of the Bank of England.

Of the splendid parks and the woods on the outskirts of the town nothing need be added here to a note of admiration; but the streets are so remarkable that it is impossible to pass them by without a word. There is the Ernst-August Place, with a statue of that King of Hanover (flanked by two great fountains) who suggests in face and figure Thackeray's Colonel Newcome; there is the fine König Strasse (Street), at the end of which is a bronze and marble memorial to the Hanoverians who died in the Franco-Prussian war; there are, to select a few more names, the handsome Georg Strasse, Goethe Strasse, Hildersheimer Strasse, and Breite Strasse, and the imposing Thiergarten Strasse and Hohenzollern Strasse, each of which, in the magnificence of its dwelling-houses, puts to shame Park Lane and other fashionable London thoroughfares.

Hanover, indeed, is so magnificent, so Hausmannised—there is a street named after the great man—that it produces a feeling of monotony; it is so fine, so regular, so large, that one might wander for hours without finding anything suggestive of the historical interest with which it is associated. Fortunately, however, under proper guidance—and the present writer gladly embraces the opportunity to express his indebtedness for friendly services in this direction to Mr Charles Cornwallis Stevenson, the British Vice-Consul at Hanover—it is still possible to find relics of the town as it was when Ernest Augustus and the Electress Sophia, parents of George I., lived in the Palace overlooking the Leine River. For the most part hidden by vast blocks of modern masonry may yet be seen those glimpses of the Hanover of bygone generations, beautiful, varied, still preserved un-Grimthorped, a pleasure to look upon, from which it is possible to conjure up a picture of the exquisite town of other days.

To find the true Georgian atmosphere, however, it is necessary to go beyond the limits of the town, and to betake one's self to Herrenhausen, about a mile to the north-west, through the famous Herrenhäuser Allee, a superb avenue with four rows of lindens planted about 1726, with carriage-way, riding-path, and a promenade. On the right is the Guelf Garden, with fine old trees, and on the left the George Garden, which stretches to the Great Garden of Herrenhausen, from which it is separated by a canal and united by a bridge.

Herrenhausen was conceived by John Frederick, Duke of Hanover, a libertine prince, who modelled himself upon Louis XIV., in whose pay he was, and who thought to imitate his master's vast pleasure-palace on a modest scale. With this object he enlisted the services of Lenôtre, the gardener of Louis, who in 1666 laid out the grounds in the French style, and carried out the task with such success that, after Versailles and Schönbrunn, it is said to be the best example in Europe. John Frederick's successor, his brother Ernest Augustus (the father of George I.), enlarged the gardens, and every care has since been taken to preserve the grounds as he left them.

The Great Garden is bounded on three sides by a canal, and on the fourth by the Palace and the Orangery; and it presents a marked contrast to the adjacent George Garden, where nature is allowed—or, by subtler art, appears to be allowed—free sway. There is, of course, nothing natural about the formal French garden, with its rectilineal paths, thick but closely cropped hedges, mythological

figures in stone, circular shelters, waterfalls, carp-ponds, and fountains, and the broad stretch of turf, with flower-beds on either side, facing the Palace, the view from which is open to the horizon. Almost hidden away is an open-air theatre, with a semicircular stone arena for the spectators; the ground that serves as a stage has been raised, two Bacchantes mark the proscenium opening, and the wings are formed of hedges at right angles, each flanked by a statue. There performed the troups of actors, singers, and dancers, generally of French nationality, that in the sixteenth and seventeenth centuries were appanages of most Continental Courts.

The Palace, begun in 1698, is a broad-fronted structure of two stories and a red-tiled mansard roof; and the main building runs around three sides of a courtyard, facing the Great Garden, with terraces to right and left over the ground-floor, and in the centre, outside, a stone double staircase descending from the first floor with a fine sweep. Away from the Palace are the stables, where a hundred carriage and riding horses found accommodation, and where to-day may be seen the old state coaches and harness; and, besides, several other houses for royal Princes and for the members of the Court, two of which are now utilised, respectively, for the family museum and the family portrait-gallery. The Orangery, close by the Palace, planned in 1692, was the favourite retreat of the Electress Sophia in her declining years. It was famous for its fruit. 'I was particularly surprised at the vast number of orange-trees, much larger than I have ever seen in England, though this climate is certainly colder. But I had more reason to wonder that night at the King's table,' Lady Mary Wortley Montagu wrote from Hanover in 1716. 'There was brought to him, from a gentleman of this country, two large baskets full of ripe oranges and lemons of different sorts, many of which were quite new to me; and, what I thought worth all the rest, two ripe ananas, which to my taste are a fruit perfectly delicious. You know that they are naturally the growth of Brazil, and I could not imagine how they could come there but by enchantment. Upon inquiry, I learnt that they have brought their stoves to such perfection, they lengthen the summer as long as they please, giving to every plant the degree of heat it would receive from the sun in its native soil. The effect is very near the same. I am surprised we do not practise in England so useful an invention.'

The Palace, considered as a royal residence, is not imposing, nor are the grounds so considerable as those surrounding the mansions of many English gentlemen; but the whole conveys exactly the note that inspired it. It was built as a summer residence, a palace of pleasure, for the royal family, and for such a purpose it is eminently suitable. Taking all things into account, it is certainly far less pretentious than most of the buildings of modern Hanover, and in far better taste.

Yet how the reigning Duke of the day found means to indulge in this luxury—it must be remembered he had his official residence in the city—it is not easy to see. Hanover under John Frederick and later under Ernest Augustus was a town of some two thousand houses, and the principality was neither extensive nor wealthy. John Frederick certainly had a subsidy from Louis XIV., and Ernest Augustus received a handsome income from his eldest brother, George William, Duke of Lüneberg-Celle (the father of Sophia Dorothea, consort of George I.), for marrying the lady known afterwards as the Electress Sophia, to whom the latter had been engaged; and of course the Dukes of Hanover levied taxes and obtained considerable sums of money by the sale of regiments composed of their subjects to any Power engaged in war—a proceeding common to most minor German sovereigns, and one which provided an appreciable portion of their income.

On the other hand, the expenses must have been very considerable, for the Dukes of Hanover kept up a show of great state. There were, besides the Princes, the Field-Marshal, three Chamberlains, five Gentlemen of the Chamber, and the same number of Gentlemen Ushers, seven pages, two tutors, a dancing-master, and a fencing-master, three physicians, a barber, an organist, six musicians, a dozen trumpeters and a bugler, thirty-four servants in livery, a *maître-d'hôtel*, a dozen cooks and a dozen assistant-cooks, ten bakers, three scullions, seven men employed in the cellars, five in the plate-room, nearly fourscore in the stables, and—for the entire establishment—two washerwomen! But the Court, though very numerous, was but poorly paid. The Master of the Horse received a yearly salary of one hundred and sixty-three pounds ten shillings of our money, the High Chamberlain one hundred and fifty pounds, and the amounts diminished, according to the office, until they arrived at one pound thirteen shillings, the modest remuneration of a scullion.

The upkeep of the town Palace and Herrenhausen, however, did not by any means exhaust the list of the Elector's expenditure, for, besides the Opera House in the Palace, he supported the local theatre entirely at his own expense; as Toland noted, surprised, 'There is a pretty Theatre with handsome Lodges [*loges*] for all Qualitys; for no body pays Money that goes to a Play there, the Prince, as in some other Courts of Germany, being at all the expense to entertain the Town as well as the Court.' Besides this, there was the cost of housing the royal favourites. With John Frederick this was a heavy item, while Ernest Augustus built Monplaisir, half-way on the road from the town to Herrenhausen, for the Countess von Platen; and George Lewis must have been heavily out of pocket through his connection with the lady upon whom he one day bestowed the duchy of Kendal in Great Britain.

Under John Frederick, Hanover had become a

centre of some political and social importance. He had acquired during several lengthy visits to Vienna and Italy a leaning towards art and letters; and at Versailles, where, owing to his conversion to the Church of Rome, he was a favourite with the Grand Monarque, he had become imbued with a passion for the bright side of life. The result of his artistic, religious, and sensuous fervour made the Palace at Hanover, and, of course, Herrenhausen, a most varied scene. He showed his interest in letters by founding a library which, under the fostering care of Leibnitz, acquired wide renown; his devotion to his Church made him welcome Roman clergy, who flocked from all quarters to his Court; and his fondness for art and the light drama was evinced by his music and the theatre, for the support of which he imported French actors and actresses and dancers and Italian singers. It was a motley throng that crowded the Great Garden at Herrenhausen while he, the ruler, slowly drank himself to death.

During the lifetime of John Frederick, his brother Ernest Augustus, then Bishop of Osnabrück, followed humbly in his footsteps, and to the best of his ability imitated these splendours at his palace—he had a Parisian *maître-d'hôtel*, we are told, and interested himself in the costumes of Sophia and her ladies-in-waiting; and when he succeeded to the Dukedom of Hanover he made little or no change, retaining all the extravagant and vicious features of the Court, to which—since he was devoid of all artistic taste—he added a certain grossness that hitherto had been absent. It was the age of paint and patches, and the fashion was as much in favour in Hanover as in England. 'I have now got into the region of beauty,' Lady Mary Wortley Montagu wrote from Hanover in 1716. 'All the women have literally rosy cheeks, snowy foreheads and bosoms, jet eyebrows, and scarlet lips, to which they generally add coal-black hair. These perfections never leave them till the hour of their deaths, and have a very fine effect by candle-light; but I could wish they were handsome with a little more variety. They resemble one another as much as Mrs Salmon's [wax-work] Court of Great Britain, and are in as much danger of melting away by too near approaching the fire, which they for that reason carefully avoid, though it is now such excessive cold weather that I believe they suffer extremely by that piece of self-denial.' The amusements there, as elsewhere, were riding and driving; and in winter sledging in the day-time, and in the evening dancing, concerts, and the theatre; with occasional reviews and State functions to break the monotony. There seems to have been little gambling, but a great deal of lovemaking, in which John Frederick and Ernest Augustus appear to have done more than their fair share. It was a happy, pleasant, coarse, shameless Court, that in which George I. and his brothers were trained.

The Hanoverians of to-day are not particularly interested in the associations of Herrenhausen, and they seem to acquiesce in the banishment of their legitimate king, who, as Duke of Cumberland, lives in retirement at Gmunden; but the place has a special fascination for British visitors. To Hanover came Thomas Parker, Earl of Macclesfield, to present to the Electress Sophia the Act of Succession, in which she was named, failing issue of Anne, as heiress-presumptive to the throne of Great Britain and Ireland. To Hanover, also, came secretly ambassadors from Whigs and Tories, each party eager to secure the favour of the next sovereign, and letters and visitors in quick succession. Many confidential interviews took place there, and many conversations must Sophia and her son, Elector George Lewis, have had in the quiet walks in the grounds of Herrenhausen. Electress Sophia declared she would die happy if she could once subscribe herself Queen of England, but this pleasure was not for her; three months before the death of Queen Anne she was struck down at Herrenhausen, on the spot where has since been erected a memorial group of statuary. The concluding scene of this particular epoch is that of George Lewis, Elector of Hanover, on the last day of August 1714, driving forth, grim and taciturn, on his way to London, there to place upon his brow the crown that once had been worn by his great-grandfather, James the Sixth of Scotland and First of England.

THE THREE-ARMED BUDDHA.

CHAPTER IV.

BEFORE Frank Denaby left home for *The Pharos* Office his friend Fraser locked up the bronze Buddha in his safe. In the evening, as the two sat smoking together in the latter's room, Frank furnished his friend with an outline of the events of the previous night, as also of the circumstances which led up to Rupini's diabolical resolve to take his life.

'From what Baynes tells me,' he said, 'I gather that, according to the police theory, the Italian must have made his way into my bathroom by climbing the pipes outside; to do so, however, he must have been nearly as active as a cat. I suppose you didn't hear the revolver-shot to which the fellow owed his death-wound?'

'I heard nothing. But it was past two when I reached home—I had been playing bridge at the club—and in all probability the shot had been fired before then.'

'Nobody seems to have heard it. As you know, the flat next mine on the other side is empty;

while as for the night-porter, he passes half his time in a state of semi-somnolence.'

'Of course the Italian mistook the man found in your room for you?'

'Undoubtedly. And had I not let Brandon persuade me to accompany him to the ball, it's almost a certainty that I should have been stabbed in my sleep.'

'You have indeed had a most fortunate escape.'

There was a knock at the door. Baynes, not finding Mr Denaby in his own flat, had followed him to Mr Fraser's, knowing that the two often forgathered of an evening. 'Inspector Melray to see you, sir,' he said, addressing Frank.

'Come in, Mr Melray,' said the journalist. 'This is my friend Mr Fraser.'

'The inquest on the foreigner who was found shot yesterday morning is fixed for ten o'clock to-morrow,' said the inspector, 'and I've called for the address of the man who fired the shot and who told the constable that he would forward it to you.'

'Up till now he has not done so. He left here in a cab, purposing, so he said, to call upon a doctor and have his wound examined. Whether he did so I have no means of knowing; neither, seeing that he was a stranger to me, can I furnish you with any clue to his present whereabouts.'

'That's awkward—very—because, in default of his evidence to-morrow, the inquest will have to be adjourned till we succeed in finding him. But if he was a stranger to you, Mr Denaby, what was he doing in your flat at that time of night and in your absence?'

'His own account was that he came on a certain matter of business; that, finding I was out and would not be back till morning, he obtained the key of my flat in order to write me a note; that he afterwards went to sleep in front of the fire, and knew no more till he was attacked by the Italian.'

'Um! How much of his story is true, I wonder, and how much made up for the occasion? I wish I had seen the fellow myself. The constable's description of him tallies closely with that of a man badly wanted by the New York police. We have also some reason for inferring that he was concerned in the theft of Lady Garside's jewels on Monday night last. Yes, I very much wish that he had come under my observation. Of course, should you hear anything from him or of him—but I've no expectation that you will—I take it for granted that you will at once communicate with the authorities?'

Frank assured him that he would not fail to do so. There had seemed to him no need for enlightening the inspector with regard to Frinton's real object in raiding his flat. For the next few weeks he kept a close eye on the newspapers, but nowhere did he find it recorded that the police had succeeded in tracing the whereabouts of 'Mr Spencer Montague.'

Next forenoon, while busy at his desk, a telegram was brought Denaby. It was from his uncle, and had been despatched from Melsham, the nearest town to Winterslade Park. Its contents caused Frank to sit up and open his eyes very wide indeed. Thus ran the message:

'An old Indian friend, Mr Jellum Ghosh, will call upon you in the course of to-day. As he is coming here on a visit, you will please give into his charge the bronze image you bought in my name some days ago, so that he may bring it with him.'

That Sir Frederick, in the course of his long residence in India, had made many friends among the various sections of the native community Frank was well aware, and it was quite possible that this Mr Jellum Ghosh was one of them, as also that his uncle, who was one of the most hospitable of men, had invited him down to Winterslade. What struck Frank as being a singular coincidence was the fact that Mr Ghosh and Mr Chundra Das, who had made such a determined attempt to obtain possession of the image, were fellow-countrymen. Of course, it could be nothing more than a coincidence, but his thoughts reverted to it again and again.

He had no option save to carry out his uncle's instructions, and, in point of fact, he had no ground for objecting to do so. Still, he would have preferred that, before giving up the bronze, Sir Frederick should have been told of the audacious attempt to steal it, and of such circumstances in connection therewith as were known to his nephew. One thing he could do, which was to write his uncle by that night's post and tell him all there was to tell.

He had arranged to lunch with a friend, but he now cancelled the engagement. There was no knowing at what hour Mr Ghosh might call, and he must wait in to receive him. Meanwhile he got back the image from Fraser, and placed it once more on his chimneypiece.

It was about four o'clock when the Indian's card was brought him by Baynes. 'Show the gentleman in,' he said. As he rose from his work and advanced to receive his visitor, he did not fail to notice that the latter had hardly set foot across the threshold before his glance, sweeping round the room, rested for an almost imperceptible instant on the Buddha.

He was a man about forty, tall and thin, and no member of a West End club could have been more immaculately got up. He would have done credit to Bond Street on a sunny afternoon. His clear-cut features had a slightly worn look, but were expressive of an alert intelligence. His eyes were his worst feature: they revealed too obviously the craft and subtlety which formed the substratum of his mental and moral equipment. Had he been wise he would have worn spectacles.

He took off his hat as soon as he was inside the room, and made Frank a sweeping bow, bending so low as he did so that it almost seemed as if his spine must perforce crack. 'Have I the honour of addressing Mr Frank Denaby?' he asked in smooth, unctuous tones.

'That is my name.'

'Then may I take the liberty of asking whether within the last few hours you have been the recipient of a telegram from your worthy and most esteemed uncle, Sir Frederick Wyllan, to the effect that I should have the pleasure of calling upon you in fulfilment of a trifling commission with which he has been good enough to honour me?'

'Pray be seated, Mr Ghosh,' said Frank, indicating a chair and taking another himself. He began to hate this fellow already, with his cunning eyes and his ornate, oily periods. 'Yes, a telegram from my uncle reached me a few hours ago,' resumed Frank, 'in which I was informed that you would call upon me. I assume, Mr Ghosh, that you are well acquainted with my uncle?'

'It was in Calcutta, a number of years ago, that I first had the felicity of meeting Sir Frederick. It was my supreme good fortune to be in a position to do him a small service, and, like the great-hearted gentleman he is, he has never forgotten it. Hearing that I was over in England for a brief stay, he has favoured me with an invitation of much cordiality to visit him at the palatial home of his world-renowned ancestors.' A self-satisfied smile curved his lips as he finished speaking. Possibly he was proud of his command of the English language.

'How soon do you purpose going down to Winterslade Park, Mr Ghosh?'

'I hope to reach there in time for luncheon to-morrow.'

'So.' It was all Frank said for a little while. Then, as he toyed with his watch-guard, his eyes fixed on the image, what he afterwards spoke of as an 'inspiration' came to him. Till this moment it had seemed to him a matter of course that he must carry out the instructions in the telegram; now he saw a way of evading them, and that without running much risk of offending his uncle. Had his visitor been a different sort of man the suggestion would probably never have occurred to him. But there was something about the Babu which filled Frank with a mistrustful sense of underlying deceit and double-dealing, and awoke within him a vague feeling of suspicion, although there seemed no genuine ground for its existence. There it was, however, and, having some faith in his intuitions, he decided to give heed to it.

'As I understand, Mr Ghosh, it is a certain bronze image—in point of fact, the one there on the chimneypiece—which, according to the telegram, I am to give into your hands?'

'That is so, sir. An image of the thrice-holy Buddha, the Wise, the Enlightened, whose name be blessed for evermore!' He crossed his palms over his breast and bowed his head for a moment.

'I am sorry my uncle should have troubled you, Mr Ghosh, because I am myself going down to Winterslade in the course of to-morrow, and will of course take the bronze with me.'

On the instant the Babu's complexion faded to the tint of an unwholesome lemon. His eyes seemed to contract to half their ordinary size and became charged with venom. His thin lips twitched spasmodically, and he drew two slow, laboured breaths before trusting himself to speak. Then he said, in a voice which had lost its unctuous quality, 'Is it, Mr Denaby, that you do not intend to obey your uncle's definite instructions?'

'That is precisely what I intend not doing. If I offend him I must put up with the consequences. But, as I shall be at the Park within a few hours of your arrival, such a brief delay can't matter greatly. There has been one audacious attempt to steal the image already, and I sha'n't rest satisfied till I have personally delivered it into its owner's hands.'

Frank's words were both clear and emphatic, and the Babu probably saw how useless any attempt to cozen him into changing his mind would be. At any rate, he now rose and took possession of his hat, saying half-aloud in Hindustani as he did so, 'This man is a pig and the son of a pig. May his grave be defiled!'

Denaby said later that if murder ever looked out of anybody's eyes, it did out of the Babu's at that moment. He felt glad that he had not let the image go.

'Then I suppose, Mr Denaby, that when I see Sir Frederick I may consider myself at liberty to inform him that his nephew deliberately refuses to comply with his request?'

'My dear Mr Ghosh, so far as I'm concerned you are at liberty to tell him whatsoever you choose. Anything you may have to say will make no difference to me.'

The Babu pondered, or seemed to ponder, for some moments, gnawing his under lip the while. Then he said, with a sudden change of tone and manner, 'Mr Denaby, I will be frank with you. That bronze image, which to you or your honoured uncle is nothing more than a curio of no especial value, is for me a sacred relic. It belonged to my grandfather of revered memory, who came from Nepal, where Buddha is worshipped, and was treasured by him as one of his choicest possessions. Unfortunately, it was stolen from under his roof, and not till yesterday did I succeed in tracing what had become of it. Now that I have found it, I am willing to pay a big price for its recovery. Mr Denaby, in exchange for the image I will give you the sum of one thousand pounds.'

Frank heard him out patiently, but there was no hesitation in his reply.

'As you are aware, Mr Ghosh, the image is not mine, but my uncle's; consequently I am not at liberty to dispose of it to any one. As, according to your own account, you will see him to-morrow, you can then negotiate the purchase of it with him.'

The Hindu's brow clouded. 'Fifteen hundred pounds,' he murmured insinuatingly.

Denaby made a gesture of annoyance. 'If you were to offer me five thousand pounds my answer would be the same.'

Flinging out one arm with a threatening gesture and muttering something in Hindustani, Mr Ghosh turned and left the room without addressing another word to Frank.

'If my instincts are not greatly at fault,' remarked the latter aloud as he went back to his work, 'that fellow is both a hypocrite and a liar. But that he should offer fifteen hundred pounds for that little bronze image is most extraordinary. Should he repeat his offer when at the Park my uncle will probably accept it. But does he really intend going to the Park? On that point I have my doubts.'

Not till the afternoon of next day was Denaby at liberty to carry out his newly formed intention of running down to Winterslade and of himself giving the image into his uncle's hands. He would stay at the Park overnight, and return to town by an early train next morning.

He crammed a few necessaries into his handbag, leaving room on the top of them for the image, which he had got from Fraser after its second night in the safe. But in the act of putting it into the bag he paused and stood for several seconds without stirring, as though a warning voice were whispering in his ear. Then he shut the bag without putting the image into it, which a few minutes later was back in Fraser's safe.

It had been dark some time when Denaby alighted at the roadside station which was within a mile of his uncle's house. It was a dry, starlit night, and he set off to walk the distance, being already familiar with the road. After leaving the station and the little cluster of houses in which it was set he met no one. Before long the road took a sharp turn and dipped to a hollow on both sides of which the trees grew thickly. Here the darkness was profound; but Frank knew that he should presently emerge from the leafy tunnel, and that a little farther on he should come to the lodge-gates of the Park.

He was walking carelessly along, smiling to himself at the thought of his uncle's surprise at seeing him, provided Mr Ghosh had not arrived before him and given notice of his coming. Should he, or should he not, find the Babu at the Park? Hardly had he asked himself the question before he stumbled and came down on his knees. A rope stretched across the road and at the height of about a foot from the ground had tripped him up. As he was struggling to his feet two figures sprang upon him, one of whom struck him a savage blow on the head, while the other snatched his bag from him and was gone in the darkness in an instant. Denaby had just sense enough to find and blow the cab-whistle he habitually carried, after which he lapsed into unconsciousness.

(To be continued.)

THE GORDON HIGHLANDERS IN SPAIN.

PART III.

'THE French army must have suffered much more than we did; we may safely add one-half more. Some cannon fell into our hands, with a very few prisoners. The Spanish loss was about one thousand two hundred killed and wounded; what they had missing no one could tell, as they went off to the rear in droves. Thus we may say a great battle was fought or trial of strength made for no important end whatever. The day after all this was over, a light brigade, three thousand strong, and a troop of horse artillery arrived from Lisbon under Brigadier-General Crawford. I suppose the French had got intelligence of this, which made them draw off and put the river Alberche betwixt us, and some despatches from General Jourdan fell into our hands, telling Marshal Soult to march from Salamanca speedily by the Puerta del Banos and Placencia, there to be joined by the divisions under Ney and Mortier, and then fall on the rear of the British army. This opened our eyes. There was only one way of avoiding this snare, and that was to retreat immediately across the Tagus by the bridge of Arzobispo, and take up a defensive position where provisions could be got for the army. I never received any correct intelligence of our army after the retreat, not so much even as a flying report.

'On the 31st July, Colonel Bunbury, commanding our battalion, got bread and aguardiente, which he divided himself among the wounded men in hospital. He expressed his satisfaction with our behaviour in the different actions in which he had had the honour to command us; and Sir Arthur, he said, had expressed his thanks to the first battalion of detachments for their bravery and good conduct in the night attack upon the hill and during the whole of the 28th, and he would not fail to represent it to His Majesty. Next day he sent a doubloon's worth of bread and two skins of wine for the use of the wounded. This was of more benefit to us than the fine speech he made yesterday, and was a great relief to every man in the hospital. He ordered all the battalion to be paid to 24th July—the last money I received for many a day; and he waited in the hospital until he saw the wounded men get their money, and was exceedingly attentive to us as far as lay in his power. Large parties of Spaniards were sent to gather the dead men and horses into heaps and burn them, for fear of causing a plague about the town.

'On the 2nd of August all the British troops

marched off by daybreak—we thought, to attack the enemy; but, to our horror, we found they had retreated, leaving us wounded men in a dreadful condition, without provisions, only a few surgeons, little medicine, and no attendants. About twelve o'clock Dr Beattie came in and desired every man that was able to make the best of his way after the army, for he expected the French in the town in a few hours. This caused a great consternation among us. I had been very cheery in the morning, but this made me change my tune. Spanish officers came through the church among us, bringing in mules and asses for those that were able to ride. Many tried to leave the place, but had to return before night; and many were obliged to lie down in the fields who never rose again. Sergeant M'Bean got a mule for himself and me, but at this time I could neither sit nor stand, my wound was so bad and my leg swollen. He got on and pranced down the centre of the church like a mounted hussar. I bade him God speed and asked him to tell my comrades—if ever he reached the regiment—where he had left me. When it was growing dark, who should come into the church, crawling on all-fours, but Sergeant M'Bean! He crept in among the straw beside me, and we kept together until our wounds were healed over. So we were obliged to content ourselves and remain at the mercy of the French.

'There were about thirty French wounded men in the church, and well they could observe what was going on. They were in great terror for the Spaniards. Some of them got red coats, caps, Highland bonnets, &c., that they might pass for British. One tall, fine-looking man got on a kilt, hose, and big coat. He was wounded in the shoulder, but could make good use of his legs, and was water-carrier for all about our corner, and was ready to help every one; he would answer to no name but Grenadier "Sansculotte."

'On the 4th the Spanish troops left the town, and took their own wounded with them, but none of the British, who were left in a very helpless condition, more especially those belonging to our battalion, as we had nobody to take charge or yet attend us. I certainly blame Dr Beattie for this, as other corps left their assistant-surgeon, orderlies, hospital sergeant, &c., while we were destitute of any assistance. On the 5th John Murray, who had been in the general hospital with the fever, came and found us in this helpless condition; and, poor fellow, although weak himself, yet having the use of his limbs, he did all he could to make us comfortable. He got us removed to the general hospital, a large convent in a fine, airy situation. We stationed ourselves in one of the passages on the second floor, and here we were for many a day beside some men of the second battalion Twenty-fourth Regiment. There were only four of our regiment left here that we knew of—namely, Sergeant Alexander M'Bean, Donald Johnston, John Murray, and myself. Murray recovered strength rapidly, and was made cook in the hospital; yet whenever his time permitted he gave us all the attention in his power. We were visited frequently by the general doctor, Higgins, who ordered us to dress each other's wounds morning and evening.

'On the 6th the French entered the town and carried on a regular system of plunder, breaking open every shut door they found, and every article that was of value to them was carried off. A great quantity of provisions found hidden in the houses of the town from our armies was now distributed with a liberal hand by the French soldiers, who did not forget their English enemies. I got a mattress and a set of red window-curtains, which served me as blankets until I entered France. The indefatigable John Murray let us want for nothing he could get; he brought us soap, linen to dress our wounds, &c. The French mounted a guard over this large convent, as much as to say, "You are prisoners of war." All who were able had liberty to go out and in through the day, and Marshal Victor gave strict orders to use us civilly, and not to take any article from us, but to purchase anything we had to dispose of. For a few days our hospital was crowded from morning to night with French soldiers come to get a sight of the English wounded, and some to purchase shoes, which were in great demand. I sold a new pair for a dollar, not to be troubled any more, for I saw some taking them by force, and I remembered the order given to some of the British at Braga, to strip every French prisoner they saw with a good pair of shoes. On 7th August we got rations from the French, three pounds of coarse bread for every eight men, and a very small quantity of beef to make soup (*bouillon*, as they called it), without salt or vegetables. The French got a regular market established in the town, which was more than the British or Spaniards could do while they had command of it; and it surprised us much that the people of the country would hide stores of provisions from their own army and ours, who were willing to pay ready-money for them. However, the French are good foragers, and I have seen at times much good come out of intended evil. Plenty of white bread, fruit, wines, &c. were brought into the market and sold for ready-money.

'On 15th August we were alarmed by the French artillery firing—thought it to be some attack; but it turned out to be the birthday of the French Emperor. They fired at daybreak, midday, and sunset. On the 27th fever got in amongst us, and swept away great numbers, especially men who had had limbs amputated or were wounded, so as to be unable to attend to themselves; for men get selfish in the midst of misery, and if a man could not help himself, alas for him! About this time a wagon attended every morning to take away the dead. The driver of this wagon I shall never forget. He was a very tall man, in the dress of a French prisoner, with long black beard and moustaches—an ugly man. He stood in the middle of the

passages and bawled out, making the place ring again, "*Combien le mort Anglais le jour?*" which is nearly, "How many dead Englishmen to-day?" If there were none he would shrug his shoulders and mutter a curse; if one or more he seemed happy, saying "*Bon!*" (Good). Then the wretch would seize the dead by the ankles and drag him off to his wagon. I heard he got a franc for every corpse he took out of the convent.

'According to report, there were two thousand six hundred British left here; but we were getting thinned rapidly by death and desertions. The French caused a general muster to be made, as some of our people had been caught and brought back while trying to make their escape. All who were able to walk and forty cartloads of wounded were sent off to Madrid; this gave us more room, but we were more strictly looked after by the French. My leg and thigh swelled to an alarming extent. The general doctor and Dr Taylor of the Sixty-sixth Regiment were for cutting it off; but to this I objected, and told them I might as well go to the grave with two legs as one. I continued poulticing the wound with the bread that should have gone into my belly, and I suffered great pain. But I was relieved in an extraordinary manner. One night after it was dark a French drummer was pursuing a woman belonging to the Twenty-fourth Regiment in full flight along the passage, when she fell right on my wounded leg. I roared out, the woman shrieked, and the drummer, thinking he was to be attacked, drew his sword and went off cursing. I was in great distress and in a high fever all night; but next morning, on dressing my wound, seven small pieces of bone came out of it, some of them about the size of the teeth of a dressing-comb, and a piece of my trousers that had been driven in by the ball. From this time I mended every day. I was well attended by Sergeant M'Bean, who was wounded in the hip, which had now healed, and he could limp about on a stick, bring water, wash our linen, &c.; but one day he fell in the cook-house, and had to take to his bed, to my great loss and his own. However, this accident was fortunate for him, for his wound broke out afresh, and two pieces of his trousers were discharged. In a few days he was on his feet again, and he cut me some young olive-trees to make me a pair of crutches, and did everything in his power to get me mounted on these. My wound was skinned over on the 2nd of October, two months after I received it, and I began to look forward a little, for some weeks before I never expected to leave the convent but by the help of "*Combien le mort*," the French wagoner. My first start out of doors was to the river Tagus, which ran past the foot of the garden, to wash my shirts. I sat in the sun till I got sick, and had to keep my bed with a kind of fever and ague, which went through amongst us.

'On the 5th November, Sunday, the hospital was visited by Marshal Mortier and his staff. He was a tall, stout man, with a star on his breast. He told us he was sorry it was not in his power to supply us with many things we stood in need of, but while bread was to be got for his own troops we should be first served. He said the French had used us better than our own army had done, in leaving us in the state they found us; for the Spaniards, being our friends, could have provided the means of transporting the wounded if our commanders chose; but instead of this we had been left a burden to the French army. He also told us that many British had made their escape; but some had been shot, and if any of us were caught in future a mile from the town we might expect to be served in the same manner. All this he said in English, and left, it is said, one hundred and sixty doubloons to purchase wine, rice, &c., for the use of the hospital. I believe it was entrusted to bad hands, and not half of it was expended in the use it was intended for.

'On the 7th November the French seemed in a bustle: drums beating, cannons driven to and fro, and planted in position on the roads leading from the town and by the river-side. A battery had been built at the end of the bridge across the Tagus, which had been repaired; but now the planks of the centre arch were removed and the French stores packed up. On our going for rations the commissary told us to "*reste tranquille*," and the Spaniards would serve us out to-morrow. The Spanish troops remained in sight all day, and we thought they meant to attack the town and set us at liberty; but no such thing. The French marched out at night; we could see the fires of both armies, and supposed the French meant to begin the attack in the morning. But the Spaniards moved off; the French repaired the bridge in quick time, and sent troops after them, and more arrived from Madrid. Sergeant M'Bean and many others resolved to make their escape; as the Spaniards were in the neighbourhood, they thought they might fall in with them before long. On the evening of the 9th M'Bean took leave of me for the second time. I gave him a loaf of bread, a small map of the country, and a letter to my mother. I never was more vexed in parting from any man, yet I advised him to start, he being married and a persevering man, and likely to succeed in anything he took in hand. Next day I got out to market and bought some bread and grapes, &c., and found my money getting very small; yet I never spent money to such good purpose as at Talavera. There seemed to be a blessing in it, and I often had something extra when feeling badly.

'The French General discovered that many of our men had escaped since the Spanish troops came near. Early on the morning of the 12th, without previous notice, all the British officers, doctors, and every man that was expected to live were turned out to the square, and were put on bullock-carts and driven out of the town on the road to Madrid. We crossed the well-contested plain and the river

Alberche, and saw many dead men's bones picked bare on both sides of the bridge, which was now repaired. Reached St Olala after it was dark; this town was nearly deserted by its inhabitants. The French guard were very kind to our wounded men, carrying those unable to walk from the carts into some stables, with their baggage, &c. Those troops that had fought in the field with us were always the kindest and readiest to assist us; when we had a guard of young conscripts they were very troublesome to every one.

'13th.—To Ventas. It was dark before we reached it, although the French soldiers pricked the bullocks with their bayonets to get the carts on. This is a very slow method of travelling, and we all were very tired sitting huddled on the carts. Two of our people died on this day's march through fatigue and want of sustenance. We passed through a dreary, uncultivated country, with no houses between the stages, and no food could be got. In the afternoon we saw from a height the spires and part of the ancient city of Toledo, across an uncultivated plain to our right.

'14th.—To Pinto, a village within three leagues of the capital. The country begins to be better cultivated and more sheltered with trees, &c.; we had passed over but a barren waste since we crossed the Alberche.

'15th.—Started before daylight to get early into the city. The French soldiers seemed very happy to get there, and so were we poor wounded prisoners; although we knew not what our condition was to be, we knew it could not be worse than it had been. We viewed the majestic appearance of the city, with its fine spires, domes, and churches, with the sun shining brilliantly upon them, as we approached it from the west, there being no hill to hide it from our view. The French cavalry was quartered in all the villages along the road, and sentries were placed on the tops of some of the churches and high houses to observe the plain country, for fear of being surprised by the Spaniards.

'We crossed a shallow river by a fine stone bridge on the west side of the city. There we saw hundreds of women washing on both sides of the river as far as we could see; each dame on her knees with a board in front of her, rubbing and washing, and singing cheerily. A hardy race of ladies, I could see from their countenances; they sympathised much with us in our distress. We passed some avenues of trees up to the city, which is surrounded by an earthen wall, with gates and a strong guard of French at each entrance. We halted. Notice of our arrival was sent to the commandant, who ordered us round to the Puerta del Sol, a spacious square with many streets leading from it. Crowds of people came round, asking when and where we were taken, and giving us bits of bread, money, &c., until the French soldiers drove them off with the butts of their firelocks. We were lodged for the night in the great military hospital. Each man received a small measure of wine and a piece of bread, of which we had much need. We thought the first stage of our misery was over.'

The journal from which the above is extracted extends to three manuscript volumes, and is full of interest. It is a remarkable fact that although there are in existence the Order Books and other papers of the Gordon Highlanders, in addition to numerous diaries and other accounts by officers and men of the regiment, there has never been published in any history of their services the valuable and authentic information now obtained; and in this connection it may be well to quote the words of the highest living authority on the subject, Colonel Greenhill Gardyne, who wrote a letter addressed to the son of the writer of this journal: 'Regarding the account of the Ninety-second company at the passage of the Douro and at Talavera, there is no other account extant that I know of. I alluded, I believe, to Ninety-second men being with the battalion of detachments; but I did not know—nor does any one else, so far as I am aware, know—that there was a complete company of that regiment.'

It is gratifying to hear the opinion which the historian of the regiment formed of the writer of the journal. He says: 'Nicol must have been a man of great character and enthusiasm, and ought, like many of his brother sergeants, to have risen to commission rank. The journal is a most interesting byway of history.'

The subsequent history of Daniel Nicol may be related in a few words. Having served continuously from 1794 to 1814, he, on the return of Napoleon from Elba, at once volunteered for service and joined a veteran battalion, until, on the return of the troops from France, he was again discharged, but was offered the rank of sergeant in his old regiment, then lying at Cork. This, however, he declined.

Exceptional interest attends the closing years of Nicol's life. In 1819 he was engaged by Robert Cadell, of the firm of Archibald Constable & Co., the publishers of Sir Walter Scott's novels, in whose publishing-house, he notes, on account of the extraordinary demand for Scott's writings, the work was often very heavy. When misfortune overtook the concern in January 1826, his services were retained by the trustees, and Mr Cadell invited him to remain, as, if he commenced business on his own account, he intended to engage him. Accordingly, in October of that year, when the stock was purchased by Cadell & Co., Nicol was at once employed. He continued in the same service till Mr Cadell's death in 1849, and his trustees subsequently employed him, till in May 1851 the business was purchased by Messrs Adam & Charles Black, to whom the rights of the publication of Scott's novels were transferred. In October 1851, however, Nicol died from inflammation of the lungs at the age of seventy-three, having spent twenty-two years in the army and thirty years in the service of Mr Cadell's firm.

POSTAL ITEMS.

THE net annual profit derived from the Post-Office exceeds five millions; but it is not generally known that Ireland does not contribute anything to this—not only so, but that the postal service in that country is carried on at a heavy loss. The deficiency about thirty-five years ago considerably exceeded £50,000 a year; and the fact having been referred to by Mr Gladstone when introducing his Home Rule Bill, Mr Parnell, who appeared to be much struck by it, stated in the House of Commons a few days afterwards—no doubt with the concurrence of his colleagues—that 'he considered the Post-Office in Ireland should remain an Imperial department.' That this decision was a wise one from his point of view subsequent events have shown; for, owing mainly to the extension of the rural delivery to every house—a measure decided on at the late Queen's jubilee—the deficiency has immensely increased. The following are the figures for the financial year 1904–5: expenditure, £1,172,264; revenue, £1,000,971; deficiency, £171,293. There is a loss on the telegraph service besides.

Scotland presents a striking contrast to this. Although, as a country, it is not in many important respects dissimilar to Ireland, not only is it not, like Ireland, a debtor, but it contributes to the annual profit no less a sum than £434,000—revenue, £1,913,000; expenditure, £1,479,000. This is a handsome amount, yet it is rather less proportionately than that derived from England. The higher proportion of profit in England is accounted for mainly by the fact that it has a larger percentage of letters to the population than Scotland and Ireland have. According to the last report of the Postmaster-General, the numbers per head are as follows: England and Wales, 69·2; Scotland, 52·6; Ireland, 36·1. As regards the total profit, if from the gain in Scotland the loss in Ireland be deducted, there would remain £262,707; and therefore, with the exception of this comparatively small amount, the entire postal profit—last year £5,071,255—was made in England.

In connection with the disposal of the gross postal revenue, it may be mentioned that on a recent occasion the Postmaster-General made the following interesting statement in the House of Commons: 'In the year preceding the introduction of penny postage, 11s. 8d. out of every £1 was spent in providing for the service, and 8s. 4d. profit was retained; twenty years ago, 13s. 4d. out of every £1 was spent on the service, and 6s. 8d. was retained. Last year, out of every £1 received 15s. 5d. was spent on the service, and only 4s. 7d. was retained.' He went on to say these figures showed clearly that the public, considered merely as customers of the Post-Office, were getting more for their money than they had got at any previous time.

Under the system adopted for charging post-letters before the introduction of the 'penny post' in 1840, envelopes were practically unknown, because if a letter consisted of anything more than a single sheet of paper it was regarded as a 'double' letter, and was charged accordingly. Subsequently, until envelopes came into general use, for almost all business letters, and largely for private correspondence as well, 'letter' paper—that is, sheets about double the present note size—continued to be used. These were so folded as to be of the size of an ordinary letter of the present day, and also to admit of their being fastened by a wafer or sealing-wax. The former was, as a rule, used for business letters, but for private letters wax was held to be necessary, the use of a wafer for such being considered most improper, indeed almost insulting. Miss Edgeworth in one of her novels makes a dignified old gentleman who had received a letter so fastened to exclaim indignantly of the writer, 'How dare the fellow send me his spittle?'

The use of wax necessitated, of course, the use of seals. These, however, are but seldom required now, not one letter in a thousand being fastened with wax. Forty or fifty years ago it was very different; and, as may be supposed, there was a great variety of seals both as regards size and shape, as well as of the mottoes that many of them bore. The following mottoes, amongst others, were observed by the writer in passing through the Post-Office: 'You deserve thrashing;' 'Enquire within;' 'Gen. xxxi. 49;' 'Don't intrude;' 'Potential mood, present tense.' Above the first there appeared on the seal a sheaf of wheat; and if to the last there be added 'we may and can love' the older members of the present generation will recall the familiar illustration of the mood and tense in question as it appeared in the once-popular grammar of Lindley Murray.

AUGUST.

Red poppies and corn-flowers spangle
The skirt of her golden gown,
The harvest moon is her bangle,
And the crops of the world her crown;
With the last of the roses laden—
Those roses so soon to die!—
August, the pitiless maiden,
Goes carelessly laughing by.

Not a leaf on the beech is turning,
There is scarcely a petal blown,
Where the fires of the sun are burning
And the chains of the frost unknown.
What doeth this fair, swift comer,
With the sickle-blade in her hand,
Stealing the soul of Summer
Out of the dear green land?

CHEERILY, CHEERILY!

By FRANCIS CUNYNGHAME (JULIAN KINGSTEAD),
Author of *The Philosopher in the Restaurant, The Last Match of the Season, The Curtain Falls, Friends from Abroad, Noël*, &c.

AND so we all saunter down to the great ship. There go our packages and baggage—our goods and chattels, our *gross Gepäck* and our *kleine Dinge*—over the cranes and down with the cranes, with a bustle—ay, and a jolly bustle, too—though a sad time is coming, I trow, for many a mother's son. For observe, John Bull, we are leaving your shores, leaving behind the dear homeland, for the Never-Never Land, for the big granaries and the great pastures of the south-eastern continent.

Even now, at the docks, as I stand watching the vessel that is to take me from all I love at home, a magnificent vista and world-show of the new life seems to open up around me. Vast tracts of green spread out under the Australian sun, scorched with heat, parched and dry with the summer; but the eye loves them and can travel to its focus across them, up hill and down dale, away by the shrubbery and the wild-flowers; now into some thicket of Australian wattle-blossom and palms, now into an almost Eastern night with all the brilliancy of the Southern Cross. And it is free there in the colonies; you are up with the sun and down with the sun, and the strength of a hundred townsmen gathers up into your limbs. As the sun rises over the hills, there is the boy at the door with the gray mare, and it's 'Give me the reins, lad,' with devil-a-care for the stirrups! and away, away, away, galloping with all your might over the great, clanging, springing turf.

And then the scene vanishes, and dear old friend Arthur takes one by the arm. 'About time to be aboard, old man,' he says.

And so we stroll up on to the big liner, and idly watch our fellow-passengers as they saunter and jostle past us one by one.

Back to the daughter-land! It is written on many faces — the faces of those to whom that far-away island means home and father and mother and wife in one; but on many others, as on mine, there is only hope, suspense, excitement, the uncertainty of the future, the dim regret of the past, the sorrow and the sadness of the mother-country left behind. Ambition, too, there may be, possibilities crowding into the brain—young, adventurous minds and strong hearts expectant of some mighty, glorious risk in the Never-Never countries of the Southern Pole. There is a ranchman of the old days yonder, with no thought for his liver, though maybe a glance at the whisky-bottle at times, for he has taken the fiery spirit of the colonies neat in his young days; he made his pile in the pioneer times out westwards, and has come home to see the farm and the long-left friends in the old country. And, by Jove! he'll spin you many a yarn that comes from those dark genial lips and those bronzed features as well as any from the capstan or boatswain's pipe-deck. He will tell you how he and Joe—that was his mate's name, but he has forgotten the other—how they were on the wallaby together between Fremantle and the Boulder Reef, when 'old Joe, 'e found the first bit o' swag in Moonie Creek and pegged out 'is claims on the Do-me-good. But the drink was the death of 'im, man, and it was too late when 'e gave it up, because Do-me-good did *'im* no good; but 'is pal, 'e got the pannings, and Joe was left nothin' but a bloomin' squatter with 'is sheep and pigs and the rest of 'em.' And then the old man will take a pull at his pipe, lean over the bulwarks, and gaze right out across the water as if to see across the many thousand miles that lie between the coast-land of the country that is his own.

'I'm goin' back to die there, maybe,' says he; and as he has lived, so he will die. For he comes of the tough old stock that went out from Glasgow

 [*All Rights Reserved.*]

and Leith and the northern cities in the long ago, and have done their due share in the birth-rate and prosperity of the colonies. He has worked hard and scraped, and at times drunk hard—ay, and sworn hard too; he has lived hard, and—he will die hard when the time for the Last Great Wallaby has come.

And you will see also on the boat happy young men who are away for the trip, and their first crossing of the line; and young girls, duly chaperoned, who are to have a gay time with their married sisters in Melbourne, and a gayer time, I warrant, with the young fellows aboard. For we all know that a ship's deck for a young couple is the most notoriously angelical and the most gloriously lovable place in all creation, and mamma had better pitch her deck-chair in the stoke-hole than not be a party to a liner's six weeks' flirtation.

But you may be asking, 'What about yourself? What about friend Arthur, who bears you company?'

The time is come, sir, when you must cease to talk, when your sentences become short, your words drawn out. A night ago were said the real, true words of parting. This is a dull, sad anticlimax; your talk now is flippant, nonsensical—that which comes with such irony before an age of parting. You long for the decree that must at last bid you leave in earnest, and then it comes suddenly. Father and mother, brothers, sisters, and friends—our dear, good Arthur also—must hie ashore. On every side that last dear kiss, the last embrace, the warm, true grip of the hands; that last 'God bless you, lad!' and that last sweet 'Fare thee well!' Tears well up into our eyes. Up goes the anchor; the sound of grating, of throbbing; the siren whistle shrieks, and then stops. And like a phantom we and the great big monster beneath our feet steal away from the land. See, on my right two girls have a tear in their eyes for the father left behind—and I guess there is many a tear in his, poor man!—but they turn with seemingly merry faces, and smile and wave their handkerchiefs. The young men would laugh, would be merry, would be unmoved; but they look at the old, old shore, and something of Britain's pride and love of home swells within them, and they leave the boat's side to go below.

But there is one who seems to take no interest in the parting; his face is turned to the figure-head that calls us on. Even now 'Home, home!' rings in his ears. The old pioneer longs for his ranch in the bush, and his bronzed red face lights up as he stands motionless, thinking, peering into space before him.

Cheerily, cheerily! The leviathan glides through the waters. Those on shore have ceased to watch and turned homewards again. Good friend Arthur goes back to his London town, to the jostling crowds and the dingy rooms and the darkness and the muddy streets.

Cheerily, cheerily! The day is magnificent and bright, and the sun is blazing now at midday; the sea sparkles and fires and glistens, scintillating now backwards, now forwards, again and again. On plunges the liner. I stand still where I was an hour ago, gazing over the edge. Thoughts of the old country have begun to sweep up and away from me like great white clouds. The crowded office where I worked, the routine, the theatres, the whole endless dull rush and rigmarole of town life all grow fainter as the ship moves farther from them. And in their place the panorama of a new magnificent world-show comes up—a life of strength and manhood and courage and the open air. Look at the rich country; see the pasture-lands and the corn-fields as they sweep over the hills and up towards the gold horizon. A small bungalow nestles in a wood of pines and firs and palms and cactus-plants. And in the stable you will find Bess and Polly and the gray mare. Look! Though everything is strange, the objects appear familiar enough, for we have dreamed them long ago.

But it is only a dream—thoughts gone mad and a brain awhirl with adventure and hope, *blasé* with the world about it. It is the dream of youth, the dream of the lands beyond the sea and the colonies of the great peoples, the beginning of the days that are and the days that have yet to be.

A PAWN IN THE GAME.

CHAPTER XLI.—THE RETURN.

JACK found no difficulty in securing a passage to London in the *Robert and Mary*, an apple-bowed transport, with stumpy masts, patched sails, and a hull like a barrel. Her lines gave him the assurance of a tedious voyage.

'She is a safe boat,' said her master; 'but,' he admitted, 'she *does* roll a bit.'

To his disgust, Jack found when too late that a smart frigate, the *Amethyst*, was sailing the day before the transport, and would arrive in London at least a week earlier. He had already written to his uncle, telling of his escape and of his immediate return to London. It was a letter with the music of hope in every syllable. Now he wrote again by the *Amethyst*, telling how he had learned from M. Duclos that Denise was married and had returned to France. In a few hurrying and broken words he described his wrecked happiness and the

reluctance with which he was about to sail for London.

'I could not return at all,' he wrote, 'but that it would seem ungrateful to you and to my aunt if I did not. Then, too, if everything else has slipped out of my life, duty remains, and I must live for it.'

Meanwhile, in London, the long silence as to Jack Lawrence's fate had slain hope. He was mourned as dead, and each member of the little group in Portman Square paid him the tribute of a separate kind of grief. With Robert Lawrence it took the form of a fury of resentment at the ill-luck that flung away his nephew like a bit of worthless seaweed. 'The lad had a great career,' he would say; and it added a new sharpness to the lawyer's resentment to remember that his nephew's death had left a great estate without an owner. Mrs Lawrence mourned for 'Jack,' as she always called him, with honest tears and a grief that had in it a motherly depth and tenderness; for Jack Lawrence had, unconsciously to himself, the rare gift of winning love. But Denise mourned for her lover with a deep and wordless sorrow, through which ran a dark thread of unforgetting remorse.

'I sent him to his death,' she said over and over again to her aunt with quivering lips. To herself she added, as a new argument for remorse, 'I hid my love. I let him go without telling him I loved him.'

She did not weep, but her smile was often sadder than tears. Her face grew thin. In her deep eyes what can only be described as a white flame of grief burned constantly. An air of sad remoteness lay upon her, as one whose life is elsewhere. She would sit with bent head, her slender hands folded on her knees, in a listening attitude, as though expecting some voice to speak to her out of the depths of space.

'It is killing her,' said Mrs Lawrence, in distress, to her husband.

'Grief doesn't kill' was that practical gentleman's reply. 'But she grows more beautiful with it all;' and with a touch of unaccustomed poetry he added, 'her face is as luminous as a porcelain vase with a light inside it.'

One morning Robert Lawrence, on going into his office, found a letter lying on his desk with an Egyptian postmark. As he took it up his fingers trembled, the characters on it seemed to dance before his eyes.

'Good gracious,' he whispered, 'it's Jack!'

It was the letter which told of his adventures in the desert, his escape, his immediate return to London. A fire of exulting gladness ran through the words. As he read the letter there crept to the eyes of Robert Lawrence, almost to his own astonishment, the rare moisture of tears, and he brushed them away with ashamed haste, although there was no one near to see them.

How was he to break the great news? He thought the shock would be enough almost to kill Denise—a touch of masculine simplicity for which his wife later laughed at him. 'Good news, you simpleton,' she said, 'is much less likely to kill than great sorrow.'

After a few moments of agitated consideration Robert Lawrence hurried away, to his clerks' astonishment, leaving briefs, solicitors, and clients without either explanation or apology. When he reached his house he ran with eager steps up the stairs. He would give his wife the intelligence and let her tell Denise. 'Women understand each other,' he muttered to himself.

'Where is your mistress?' he shouted to one of the maids.

'She is out, sir.'

At that moment the door opened, and Denise came in, her face, with its pensive beauty, looking more like a bit of illuminated porcelain than ever. She smiled in greeting to her uncle, and then something in that gentleman's face startled her. She looked steadily at him, with lips that began to tremble. The very pupils of her eyes seemed to dilate; her woman's soul looked out of them; she was reading with swift and subtle insight the news lying unspoken in her uncle's brain. She had caught his sleeve with clutching, trembling hands.

'You have news,' she whispered.

The hunger in her eyes, the anguish of longing with which she challenged him—all this was too much for Robert Lawrence. 'Give me a kiss, little woman,' he said huskily.

She kissed her uncle automatically, but she was watching his eyes with a gaze so still and intent that the toughened lawyer, with a soul almost as dry as his wig, felt his lips quiver.

'Yes, thank God!' he cried, and then he stammered out the great news. Jack was safe and well, and on his way home. He would have gone on with details and speculations, but Denise in a passion of gratitude had fallen on her knees, her face bowed on her hands. She was praying, and Robert Lawrence stole on tiptoe from the room. Its atmosphere was too sacred for him to linger in it.

Denise was still kneeling in a passion of silent and adoring thankfulness when the door opened, and with hurrying feet and face covered with happy tears Mrs Lawrence broke into the room. She stopped as she saw the kneeling figure and the bowed head; then she softly knelt down too. Without a word, Denise put out her hand to her aunt, and with clasped hands the two women gave God thanks.

The weeks that followed ran fast, and ran to music. Happiness is a strangely subtle artist. It was summer-time; the garden was a tangle of roses; the air was rich with perfume. Morning came with the carol of the lark; the evening was rich with the song of the nightingale. But no colour or perfume in summer gardens and no music in the summer sky was half so rich as the happiness which now made Denise's life beautiful and

fragrant. A diviner summer than sun-filled skies can create—the summer of love and gladness—had come, and come suddenly, to her, and every faculty in her broke into blossom.

'Little woman,' said her uncle to her, 'Jack's a lucky fellow to have a sweetheart with a face like yours waiting for him.'

Denise tossed her head gaily. 'You must not call me his sweetheart, sir. You are too premature.'

Three weeks later came Jack's second letter, telling how he had heard the news from M. Duclos that Denise was married and had gone back to France. 'I cannot complain,' he wrote. 'I suppose you all counted me as dead. In any case, Denise was free. She knew I loved her, but she never said a word which entitled me to say she loved me. I suppose that happiness was beyond my deserts. So end all my dreams. The news has changed the whole aspect of my life. At first I thought I would stay in Egypt. To come back to the familiar circle and miss her face would be a pain too great. But I owe something to you and to my aunt; and, after all, I dare not spoil my life. So I am coming back, and in a transport which sails almost at once. But sometimes I am tempted to wish I had found a quiet grave in the desert sands.'

Robert Lawrence stormed furiously at the news, and expended many epithets on 'that lying scoundrel Duclos,' and even discharged a few at Jack's 'stupidity' in believing such a tale. Mrs Lawrence, her eyes snapping with equal anger, listened to her husband's expletives with unashamed sympathy.

Denise read the letter with flushed cheeks and kindled eyes. 'How could he think it?' she whispered. Then she laughed a laugh so full of happy mirth that it sounded like a running chime of silver bells. 'The foolish fellow!' she cried, and wiped from her eyes the tears the laughter had brought.

'It is no laughing matter to him,' said Mrs Lawrence in aggrieved tones. 'It has almost broken his heart.'

But Denise had no pity to waste on her too credulous lover. 'He should have known me better,' she said.

'The news,' Mrs Lawrence went on, 'might have prevented him coming back to England.'

Denise's face grew pale at that suggestion, but her new-found happiness was of a courageous temper. It had not survived the sea and the desert to be killed by a lie on the lips of M. Duclos.

'He would have found out in time,' she said, 'and then he would have come.'

So they all waited with mingled feelings for Jack's home-coming.

(To be continued.)

WHY IS BUTCHER-MEAT SO DEAR?

THIS is a question which is often asked by the thrifty housewife, but it is one not easy to answer satisfactorily in an off-hand way. One has only to consider the far-reaching interests which are concerned in the breeding, rearing, and fattening of animals for food—how it takes, on an average, at least three years to have cattle ready for the butcher, and that it usually implies a great amount of special feeding with expensive meals and oilcake, in addition to liberal supplies of roots and fodder. It will thus be easily understood that when the supply of fat cattle falls below the normal or there has been a time of great trade-prosperity, and the demand increases to an unusual degree, a scarcity occurs and prices advance.

During the past thirty years, experience has shown that any deficiency in the supply of home-fed meat in the United Kingdom has been made good by an increase in the supply from abroad, either in the form of live cattle or dead meat. The position at the present time is that meat is dear in almost all countries—dearer on the whole than it has ever been before. The increase in the consumption of meat in France is noticeable, and the scarcity of cattle has been to some extent made up by a largely increased use of horseflesh. The same thing has taken place in Germany, where meat has advanced considerably in price of late years. There have been periods when the price of meat rose to a high level, but these periods, as a rule, were of comparatively short duration, and happened before the overseas supply of meat had begun to make up for the scarcity in the United Kingdom.

The trade in foreign meat has developed greatly within the last twenty-five years, and most authorities are agreed that at least 40 per cent. of the total meat consumed in this country comes from abroad. The principal sources of supply are North and South America and Australasia. The best quality of beef comes from the United States in a chilled form. Beef in comparatively limited quantities is supplied from New Zealand, the quality of the best being equal to prime American; but the necessity of freezing it hard for the long voyage gives it a secondary place in our markets. Freezing meat hard causes it to deteriorate from a commercial point of view, and renders it dry after it is cooked. Beef and mutton are most affected; but in the case of lamb, which is now imported in enormous quantities—New Zealand alone furnishing usually well over two million carcasses per annum, while Australia contributes over a million and a quarter and Argentina has sent in for the first six months of this year about one hundred and twenty thousand carcasses—the meat is not seriously injured by freezing, and it commands a

ready market at a higher average price than either mutton or beef.

At the present time various interesting experiments are being made whereby meat may be placed on British markets as nearly as possible to resemble fresh-killed meat. A certain measure of success has been reached with several cargoes of beef from the Argentine, and it is not too much to say that if the process becomes an assured commercial success it will no longer be necessary to carry live cattle from any country for the purpose of their being slaughtered at the port of landing. Attention is being specially concentrated on the carriage of beef by this new method from Argentina, where two sterilising processes are in operation in at least three large refrigerating establishments. Beef which has been subjected to the new treatment fetches a higher price than ordinary chilled, but requires quick handling when the temperature is high. It is not considered that mutton or lamb in carcass could be treated so as to ensure much improvement on the present method of freezing.

It may be interesting to take note of the price at which the two main classes of imported meat may be bought wholesale, as well as the cost of British meat. The prices given are average ones for the past two years, and the quotations are for first quality in each case: British beef, fifty-three shillings and eightpence; port-killed American, fifty-one shillings and fourpence; Argentine, frozen, thirty shillings; Argentine, chilled, thirty-three shillings; United States, chilled, forty-four shillings—all per hundredweight. At the present moment (July 1908), six shillings per hundredweight may be added to these various classes to arrive approximately at the prices which have been ruling for the past six weeks, but which now show a tendency to decline. The wholesale price of mutton for the same period is as follows: British, seventy-three shillings; Argentine, frozen, thirty-five shillings; Australian, frozen, thirty-two shillings; New Zealand, frozen, forty shillings—all per hundredweight. Mutton has fluctuated very much in price, but on the average no rise in this class of meat has taken place. The present dearness of butcher-meat is to some extent accounted for by the fact that while there has been no diminution in home supplies of meat, and the numbers of cattle in the producing countries have, as a rule, increased, they have not done so in proportion to the increase of population and the apparently growing demand for flesh-foods. The great drought in Australia a few years ago was the cause of an enormous reduction in the numbers of live-stock. In Queensland alone two-thirds of the cattle died. In 1891 there were upwards of six million head of cattle in the state, but these numbers had fallen in 1902 to two millions. It is now estimated that there are four millions of cattle, and an export business in beef on a large scale will soon take place providing the seasons remain favourable. The United States, with seventy-two million head in 1907, establishes a record in point of numbers, but scarcity of corn and financial disturbance have operated against the fattening of stock, which has thus been unusually scarce. The South American Republics have large stocks of cattle, and they are being drawn upon to a great extent in order to make up for the shortage in North America. The deficiency in the overseas supply of meat for the first six months of 1908, comparing the corresponding period of 1907, is equivalent to sixty-one thousand head of cattle. Twice as much foreign meat is now consumed in the United Kingdom as was the case twenty years ago. It has been observed that the consumption of imported bread-stuffs has increased in a much less degree, notwithstanding the reduction of home supplies, and that the position appears to suggest that the proportion of meat to bread in the national dietary has substantially increased; or, in other words, that the average standard of living has risen during this period. It must be generally admitted that this is so. The mass of the population, it is evident, eat more meat now than at any former period.

Within the past few years a movement which the increasing cost of flesh-foods may help to foster has set in in the direction of abstinence from the flesh of animals slaughtered for food. The tendency is most marked among people of culture or sedentary habits. The movement has met with considerable success by helping to provide vegetarian food depôts and restaurants in most large towns, where wholesome meals may be obtained at a cost usually under the ordinary scale required for a meat dietary. There is also a large and important literature dealing most exhaustively with the relative advantages of vegetarian foods. While this is so, the consumption of flesh-foods, as has been observed, does not diminish, and there is evidence to show that meat-eating is beginning to be more common among certain Asiatic peoples. The Japanese are using more meat, especially since the war with Russia, when both the army and the navy had issued to them rations of meat; and it has been asserted that they have secured immunity from the disease known as beri-beri, which was often prevalent among the seamen of their fleet, by the issue of a ration of some flesh-food to the men. No specific remedy for beri-beri had been discovered until this plan was tried, and it is alleged that immediate improvement was observed in the health of the seamen after they began to eat meat. The evidence seems to show that the disease arises from a too exclusively vegetable diet or from eating unwholesome rice.

The supervision and inspection in connection with the slaughter of food-animals and their wholesome condition receive more attention than formerly; the gradual extension of the system of municipal abattoirs having a monopoly for a district, and the steady abolition of private places of slaughter, are doing much to reassure the public as to the

reliability of the meat-supply. There is, however, much to be accomplished in this direction before a uniform system of meat-inspection can be adopted throughout the country and at the ports. Medical authorities, as well as veterinary surgeons, generally agree that there is much less danger in the consumption of meat cut from a carcass which in all respects could not be described as sound, if the meat is eaten after being cooked, than if milk is consumed which has been drawn from a cow with tubercular lesions in the udder. In this connection a medical missionary states that while itinerating among the villages of an East Indian state, a malignant type of fever broke out among the cattle, and large numbers died. These were handed over as by right of custom to one of the low-caste tribes, whose occupation is that of tanning hides. He noticed with surprise that these people cooked and ate the meat which they cut from the carcasses of the diseased cattle, and throve on it; for he had the matter under close observation for a considerable time. They were after a while, he said, in a healthier condition than the members of the other castes who were non-flesh-eating or who had not partaken of this particular meat.

The danger to the public health which the consumption of milk and butter infected with tubercle bacilli entails is very great. Recent investigation by the American Bureau of Animal Industry into the question as to the precise period of time during which tubercle bacilli remain alive and retain their virulence in butter has demonstrated how serious the risk is to the consumer. The conclusions drawn from the inquiry, which was conducted on scientific lines, are that tubercle bacilli show no appreciable attenuation in ordinary salted butter in forty-nine days, and that they are still highly virulent after ninety-nine days, or more than three months. It is right to mention that the butter examined was made from milk drawn from a cow suffering from tubercle in the udder. The remedy for this state of matters is an international effort to secure that all diseased cows in the first instance, and particularly those in which tubercular disease has developed in the udder, be slaughtered, and that some method be designed to further secure fresh blood in the breeding of cattle by frequent crossing between approved stocks reared in different districts. The British Board of Agriculture as well as the Irish Department of Agriculture—which are both doing good work—there is reason to believe are directing their attention more than ever to the elimination of disease from our herds and flocks.

In the marketing and preparation of animals for food, it is desirable to have this done as far as possible at convenient centres and on sites sufficiently isolated from the main thoroughfares of large towns, and having railway access. Many of the larger towns on the Continent have concentrated these and various allied interests. The advantages are the preservation of the amenity of large centres of population by freeing the thoroughfares from the traffic in cattle, and the improvement in the method of conducting a business in such a perishable product as meat is by the provision at these centres of cold storage and systematic inspection. The Corporation of Edinburgh is at present constructing premises on these lines on a comparatively isolated site to the west of the city and equidistant from the suburbs of Slateford and Gorgie, into which railway facilities will be introduced, so that live-stock or dead meat may be handled at one centre in the most approved manner. It is held by some that the establishment of institutions of this kind should be of a compulsory character, and in the nature of a monopoly for the public welfare, and that they ought to receive a certain amount of Imperial support on the ground of the general public advantage. Agriculture, it is urged, would be helped and stimulated by the provision and maintenance of such public markets and public places for the slaughter of food-animals.

Why butcher-meat is so dear is a question that is often asked by the producer as well as by the thrifty housewife. He receives, he will tell you, something like an average of fivepence halfpenny per pound, and has to pay the butcher an average of about one shilling per pound for the quantities he may purchase for his own use, but he does not always explain that he uses only the most expensive parts of the animal; and that the butcher's average price, after all is said, is usually not extravagantly high is well enough known to those who are thoroughly versed in the practical details of the business. Assuming that the producer receives for a bullock scaling ten hundredweight liveweight a sum of eighteen pounds ten shillings—a fair average rate for prime quality year in and out—this is, as may be readily calculated, a rate of thirty-seven shillings per hundredweight liveweight. The animal when dressed after slaughter will have lost about four hundred and sixty pounds, which is accounted for in the offal. The weight of the carcass being thus six hundred and sixty pounds, it follows that the cost of the meat will be close on sixpence three-farthings per pound, and the butcher naturally looks to the sale of the offal, which includes the hide, surplus tallow, and the edible internal organs, to reduce the cost. A recent and a rather severe fall in the price of hides and sheep skins has naturally had the effect of increasing the cost of the carcass. A recovery in price has now set in for hides, but sheep skins are still low in price. The offal of a bullock of the weight referred to above may be sold at present to yield rather over three-farthings per pound of the carcass-weight, which reduces the cost of the meat to about fivepence and seven-eighths per pound. In the disposal of the meat to the public there is a certain amount of loss in the weight of bone and trimmed-off portions, which yield only a small percentage of the original cost of the carcass. There is also loss by decomposition.

and loss as a rule in selling parts which, owing to weather conditions, may not be in demand. The lot of the ordinary retail butcher, who has to stand behind his counter and face warm weather, rising markets, and a fastidious public, is not always a very happy one.

There are other reasons why meat is dear which do not appeal to the ordinary consumer. Far-reaching changes, for instance, are taking place in the range country of the United States. Sheep are taking the place of cattle in many districts. There are risks attendant on the production of live animals for food which are bound to operate in the direction of placing limits on the supply to a much greater degree than will ever be the case with vegetable products.

THE THREE-ARMED BUDDHA.

CHAPTER V.

WHEN Frank Denaby opened his eyes and stared about him, he was lying on a couch in a room which he recognised as being the library at Winterslade Park. Close by, and regarding him anxiously, stood his uncle and his aunt Agatha, Sir Frederick's widowed sister, who managed both the household and her brother. There, too, was a third person, a stranger to Frank, who proved to be the village doctor.

'He'll do now,' said the latter. 'There's nothing very much the matter. The thick cap he was wearing broke the force of the blow. In a couple of days he'll be as right as a trivet.'

'How do you feel by this time, my dear boy?' asked his aunt, as she bent over him and pressed one of his hands.

'Just a bit mazed, and I've a beastly headache.' With that, his other hand went up to the side of his head and rested there for a few seconds on a lump the size of an egg.

Sir Frederick had crossed to the table and poured out a glass of his prime old port, which was regarded by him as a universal remedy. 'Here, drink this,' he said as he proffered the glass.

Dr Beckwith pursed out his lips, but said nothing. He was not a stranger to Sir Frederick's port.

Frank sat up and swallowed the wine. 'I presume, uncle, that your Indian friend, Mr Jellum Ghosh, arrived some hours ago?' he queried.

'My Indian friend, Mr—— What is the boy talking about?'

'I am referring to the man you telegraphed me about yesterday morning, who'——

'No message from me was sent you yesterday morning.'

'Then you don't know Mr Jellum Ghosh, and he is not at the Park?'

'To the best of my belief I never heard the name before, and certainly no such person is under this roof.'

'It's owing to him that I'm here. I had my suspicions that he was a fraud; but my head is a bit queer just now, and I'll explain things in the morning. Tell me this, however: who found me and brought me here?'

'You were found by Dawson, my man-of-all-work, lying insensible in the road, as he was returning from the village. Being a muscular fellow, he contrived to hoist you into the pony-cart and bring you here.'

The doctor now intervened.

'I think Mr Denaby has talked enough for the present,' he said, 'and I advise him to go to bed at once. I will send him a sedative, and after a good night's rest he will find himself a different man in the morning.'

'Your room is quite ready, dear,' said Aunt Agatha. 'I ordered a fire to be lighted, and presently I will send you up a little soup and a few slices of chicken.'

'And another glass of my port won't harm you. But, by Jove! I'm forgetting my guests. They will be wondering what's become of me.'

Denaby was up and out of doors by seven o'clock next morning. Save for the lump on his head, which was still very painful, he felt nearly as well as ever he had done. He was glad to be away from London, were it only for a few hours, and to be able to invigorate his lungs with the fresh, sweet air which blew across the Derbyshire moors. As soon as breakfast was over he must have a talk with his uncle, after which he would be in time for the eleven o'clock train back to town. Meanwhile he went for an hour's tramp.

He was back in the grounds on his way to the house, when, on turning a corner of the shrubbery, he came upon an apparition which for a little while froze his feet to the ground and sent the blood surging madly through his veins, so that for a space of some seconds everything looked blurred and dim. Then his vision cleared, and he saw, to his wonderment, that the apparition was still there. 'Can it be a reality?' he asked himself as he drew a few steps nearer. Next instant his question was answered, and in the most delightful fashion possible.

A quick turn of the head, a sudden startled look, a swift rush of colour that dyed throat, cheeks, and brow one rosy tint, and Elsie Deighton in all her fresh beauty stood revealed. On what magic carpet had she been whisked through the air all the way from Minden Lodge to Winterslade Park? Nay, with what purpose was she here at all?

She was simply gowned in white, than which nothing could have suited her violet-eyed loveliness

better. She had been culling a bouquet of autumn blooms for the breakfast-table, and held a bunch of them in one hand.

Frank lifted his cap, went forward, and held out his hand, which was taken as frankly as it was proffered. 'It sounds banal, Miss Deighton, to remark that to meet you here is a tremendous surprise to me, yet to meet as if it were not a surprise would be absurd.'

'Yes, my presence here under your uncle's roof must seem unaccountable to you,' she said as she gently withdrew her hand; 'yet, like many other seemingly strange happenings, it is capable of a very simple explanation.'

'Oh,' he exclaimed with a laugh, the laugh of a man who has suddenly stepped out of darkness into sunlight, 'no explanation is needed or wished for by me. Far from it. It is enough to have found you here; by what necromancy it has been brought about concerns me not at all.' His voice had in it a ring of that passion to which no young woman can listen wholly unmoved. Before the ardour of his gaze her own eyes fell, her bosom thrilled with strange, delicious emotions; and in the course of those few seconds she realised what heretofore she had only suspected, that her heart was lost to her for ever.

'Necromancy has nothing to do with it, as you shall hear,' she said, speaking a little unsteadily. 'I presume you are aware that your uncle is about to leave Winterslade Park?'

Frank gave a palpable start. 'No such intention on his part has ever been hinted at by him to me.'

'Such, however, is the fact. It seems that he owns a house in London, at present empty, and that he intends to make his home there in future.'

'You have indeed sprung a mine upon me, Miss Deighton.'

'Now, as it happens, for some time my father has been looking out for a country residence. Learning from an advertisement in the *Times* that Winterslade was to be let on lease, he came down in order to view the property, and sought an interview with Sir Frederick. When they met and had talked together for a little while, they discovered that they were both old Indians. At the time my father was building up his fortune as a merchant in Bombay, Sir Frederick was serving under the Viceroy—he served under three of them, I think he told papa—in Calcutta. After that they got on famously together, the result being that my father and I are here on a week's visit, and I think it is now nearly settled that this will be our future home, for papa is delighted with the place.'

Suddenly she laid a hand lightly on her companion's arm. 'Oh, how remiss of me!' she exclaimed. 'Your uncle told us last night that on your way here you were attacked by two miscreants and were unable to come down to dinner; yet I'—— She paused, as if at a loss to express what she was wishful of conveying.

'It's really not worth referring to,' said Frank lightly. 'That I'm out and about this morning is proof enough that there's nothing much the matter with me.'

Before more could be said, a turn of the path brought them plump on Sir Frederick and Mr Deighton, the latter portly and aged sixty, with the keen, shrewd aspect and slightly aggressive bearing of your thorough business man who has risen in the world by his own exertions. Sir Frederick introduced Frank, and due inquiries having been made and answered respecting the latter's damaged head, they all went indoors to breakfast, a meal presided over by Aunt Agatha.

CHAPTER VI.

WHILE our little party were at breakfast the weather changed, and it began to rain heavily, so they presently adjourned to the library, and there Denaby was called upon by his uncle, with whom he had previously had a few words in private, to recount the incidents which led up to his unexpected appearance at Winterslade. Sir Frederick had a notion that the narrative might serve to while away an hour till his guests could again get out of doors.

Frank had not expected to be thus called upon, but journalists as a class are not easily nonplussed; besides which, Elsie's violet eyes were bent inquiringly upon him.

What he had to tell is already known to the reader. He began with a description of the image of the three-armed Buddha, bought by him at his uncle's request. Then he told of the letter from Rupini's wife, of the appearance of Tom Brandon, and how he had been persuaded by the latter into accompanying him to the ball at Minden Lodge. At this point his eyes encountered Elsie's, and a meaning glance flashed between them. Then followed an account of what happened on his return to his flat—of the finding of the Italian's dead body, and of the explanation of the man stabbed by the latter (in mistake for him, Frank Denaby) that his purpose in being there was to purloin the bronze Buddha in return for a payment of two hundred pounds offered him for that purpose by a certain Mr Chundra Das.

Then Frank went on to tell of his receipt of the telegram, which he now read to his auditors, and of what passed a few hours later between him and the man who called himself Mr Jellum Ghosh, resulting in his determination to be himself the bearer of the bronze to his uncle. 'But at the last moment,' he finished by saying, 'something seemed to warn me against bringing the image with me. Accordingly, I left it behind in my friend's safe, and I am very glad that I did so, because I think there can be no doubt whatever that last night's attack on me was merely another attempt on the part of Mr Chundra Das to obtain possession of the bronze.

Great must have been his disappointment at finding it was not in the stolen bag!'

With the shower of comments and questions which followed on the heels of Denaby's narrative we need not concern ourselves.

Elsie alone remained silent, sitting motionless and like one deep in thought. At length she said, addressing her father, 'Papa, you have not forgotten young Soma Khush, who was formerly in your counting-house at Bombay, who about three months ago arrived in London and called upon me at Senlac Gardens, and for whom you kindly obtained a berth in a City office?'

'No, my dear, I have not forgotten the young man. It seemed an idiotic act on his part to come over to England. But what about him?'

'I never told you the real reason which led him to come so far, feeling sure that your comment would have been, "What superstitious rubbish!" and indeed to me at the time it seemed the merest foolishness; but after what has just been told us I don't know what to think. However, it seems to me only right that I should supplement Mr Denaby's narrative by revealing to you the secret purpose which brought Soma Khush all the way from Bombay.

'Soma had two uncles, one of them known as Mr Jamsi Das, and the other—it may surprise you to hear—as Mr Chundra Das. The latter was ostensibly a sort of general dealer in the native quarter of Bombay, but his main business was that of a money-lender to Government officials and other Europeans who had run short of funds. Jamsi Das was in the Government employ at a station about fifty miles up-country, and at the time of his death, about eighteen months ago, he had amassed a small fortune. There had been a feud between the brothers for years, and Mr Jamsi Das, whose health was bad, had more than once assured Soma that all he might die possessed of should go to him. But after his death, which was quite sudden, no document of any kind could be found having reference to the disposition of his property. Then Mr Chundra Das appeared on the scene and laid claim to everything on account, as he alleged, of money advanced at different times to his brother, with interest thereon; in proof of which he produced certain acknowledgments bearing the dead man's signature. Poor Soma found himself left out in the cold.

'Several months passed, and then, for some reason which Soma did not make clear to me, he consulted a native soothsayer or dabbler in the occult—such men abound in the East—in the hope of obtaining an answer to a certain question which of late had kept on clanging persistently in his brain. Of the nature of the question I know nothing; but from what he told me it would appear that the soothsayer put him into a sort of hypnotic trance, in which he beheld, with all the vividness of reality, some one seated in a room that was wholly strange to him, that some one being none other than me, Elsie Deighton. He had seen a good deal of me during my two years in Bombay, and could not be mistaken in my personality, for I was taking lessons in Urdu at the time, and whenever Soma brought letters and papers from the office to the house for papa I used to avail myself of his presence to improve my colloquial knowledge of the language. But after what we have been told this morning it will probably still further surprise you to hear that in Soma's vision I was holding a small bronze image of the Buddha having three arms!'

So far her listeners had remained silent, but now they all, save Denaby, found something to say. There was more to come, and he waited.

It was in answer to a question by her father that Elsie said, 'Soma's voyage to England and his call upon me were the outcome of his vision, and dreadfully disappointed the poor fellow was when he found that I had never seen a three-armed image of the Buddha, and knew not where one might be found. It seemed, indeed, as if he had left home on a wild-goose chase; notwithstanding which, he refused to go back. "I will wait," he said. "Not without a purpose was that vision vouchsafed me. The wheels of Destiny revolve slowly, but they never cease to turn. Yes, I will wait." And he is waiting still.'

There was no lack of animation in the talk that now ensued. In the result, it was decided that, as the whole party would be in London a week later, Soma Khush should be summoned to Senlac Gardens, where he would find materialised the vision seen by him in his hypnotic trance in Bombay.

'It's a queer business from beginning to end,' remarked Mr Deighton; 'but for the life of me I can't make out in what way the finding of the bronze image can benefit our young Hindu friend.'

'Neither can I,' replied Elsie. 'Possibly Soma himself could not enlighten us. But with him, as with so many of his countrymen, mysticism and reality are so mixed up as not always to be distinguishable one from the other.'

By the time Frank Denaby had been three days at Winterslade, Mr Deighton—who was of an observant turn, and let few things escape him—had conceived a very favourable opinion of the young journalist. He was led to study him more particularly than he might otherwise have done because, even in that short space of time, from his bedroom window, which overlooked a secluded portion of the grounds, on three separate occasions he had seen his daughter and Denaby pacing the trim walks together with that air of sweet companionship and of being rapt away from all extraneous matters which, to the astute eyes watching them, seemed at once to proclaim them as lovers, either declared or undeclared.

'Um! um! I must look into this business,' muttered the ex-merchant to himself. He had accepted Frank as Sir Frederick's nephew, and had not hitherto made any further inquiry about him.

This evening, however, he and his host being alone, he said, 'That nephew of yours seems a decent sort and superior to the ordinary ruck of young men one comes across in society nowadays. By the way, has he any sort of occupation, or is he living on his private means?'

'He has no private means, and since his father died, a ruined man, a few years ago, Frank has had to work for his daily crust. He is now and has been for some time on the staff of *The Pharos* newspaper.'

A murmured 'Oh!' escaped Mr Deighton, and his face lengthened visibly.

'During his father's lifetime he had a liberal—a too liberal—allowance, and he spent it royally,' resumed Sir Frederick; 'but when trouble came and he had to face the world he stiffened his back and turned over a fresh leaf. Of course I could have afforded to make him an allowance; but I said to myself, "It will make a man of him, and prove the stuff he's made of, to have to fight his own battle." And I was right in my surmise. All the same, sir, I may tell you in confidence that Frank is my destined heir, and at my demise will succeed to all I may die possessed of.'

Mr Deighton's face brightened visibly. 'He's a fine young fellow!' he said heartily.

Next day, without seeming to do so, he kept a watch on his daughter's movements, and thus it was that for the fourth time he was enabled to spy upon our pair of unavowed lovers. Later in the day he had a private explanation with Elsie, who, being hard pressed by her father, confessed, with a proud light in her eyes and a vivid spot on either cheek, that Frank Denaby was the only man for whom she cared or ever could care. This, later still, led to another talk in the smoking-room between Mr Deighton and Sir Frederick.

Denaby's intention had been to stay only one night at the Park, yet here he was lingering on day after day because he lacked sufficient strength of mind to tear himself away. He had telegraphed to his editor; and, it being the dead season of the year in town, he had been readily granted a week's holiday. He was quite aware that he was dwelling in a fool's paradise, and that when the little party at the Park should break up he and Elsie would have to part for an indefinite time—possibly for ever. Therefore it was that he was determined to make the best of the few golden hours that were left him.

'D'you know, Sir Frederick,' remarked Mr Deighton after a pause in the talk, 'I've a notion that your nephew and my little girl are becoming rather—what's the French word?—*épris* with each other. They spend half their time together out of doors, and anybody might mistake them for an engaged couple.'

'Ho! ho! is that how the land lies? Well, young folk are the same the world over. Under the circumstances, it would be a wonder if our brace of juveniles didn't get up a little flirtation, if only by way of practice, and because here in the country it's the pleasantest occupation they can hit upon.'

'I've reason for thinking there's more in it than a passing flirtation.'

'So! Am I to understand that Frank has proposed to Miss Deighton?'

'A few hours ago he had not. I think it not unlikely that he hangs fire because of the inadequacy of his means, and because he is probably aware that on coming of age my daughter will inherit a considerable fortune. If that is his motive, I need hardly say how honourable I consider it on his part.'

Sir Frederick glanced sharply at his companion. 'Oh, if that's the only obstacle it can easily be remedied. I'll have a little talk with Frank between now and to-morrow.'

He was as good as his word. He challenged his nephew to state definitely whether he was really in love with Miss Deighton, and whether it was his intention to propose to her.

'That I am sincerely in love with Miss Deighton is an undoubted fact,' replied Frank, a rich colour dyeing his cheeks, 'and I have some reason for thinking that she cares a little for me in return. But as for asking her to become my wife, what would her father say to such a proposal? She is an heiress, while I am only a poor journalist, and there's a big gulf between us. Somehow, we have drifted into caring for each other, and now the mischief, if I may term it such, is beyond remedy. Of course the blame is wholly mine. I ought to have'——

'Tut, tut, laddie! don't make excuses where none are needed. Miss D. is a sweet creature, and if I were forty years younger I should most likely fall in love with her myself. Leave the matter in your old uncle's hands for twenty-four hours, and don't let yourself be down-hearted.'

Twenty-four hours later he button-holed Frank. 'Hark'e, my boy,' he said, 'go to Mr Deighton as soon as you like and ask him for his daughter's hand. I'll wager a sovereign to a farthing that you won't meet with a repulse.'

Neither did he, for Sir Frederick had intimated to the ex-merchant his intention to settle a liberal allowance on his nephew from the date of the latter's marriage.

Thus easily was overcome what to Frank had seemed an insuperable difficulty. We may be sure that after his interview with Mr Deighton he lost no time before he put his fortune to the touch with Elsie herself. That night there was not a happier pair of lovers in England than they.

(To be continued.)

HOW A RAILROAD KEEPS HOUSE.

WHEN we think of a railway we generally think of the locomotives and cars which make up the trains, the track on which they move, and the depôts and booking-offices where we get our transportation. So one would imagine that most of what a railway company needs to buy is its rolling stock, the rails and ties for its track, the fuel and water for its engines. But such are only a few of the necessities of a great modern system such as those which cross the United States. Indeed, the money expended on articles which would not occur to us is so large that it seems almost beyond belief.

The fact is that such a railroad must provide a multitude of things, especially where it operates cars where travellers can not only sleep but have their meals as in a hotel. So the company may employ a purchasing agent, who might better be called the 'general housekeeper.' He buys necessities for the cars and for the depôts; and it is a part of his business to see how much money he can save for the company by selling material which is no longer of any value to it.

To give an idea of the importance of 'railroad housekeeping,' as it might be called, we will take one of the larger companies of the United States whose trains run over several thousand miles of track. During one year the 'general housekeeper' purchased and distributed twenty-six thousand brooms to keep the stations and offices of the company clean. Twenty thousand boxes of soap, twenty-five thousand scrubbing-brushes, and a similar number of hand-mops also figured in the expenditure. The housekeepers of the individual stations and offices represent a formidable army. Upwards of ten thousand of these are employed. At many of the small stations the agent is his own housekeeper, ticket-seller, telegrapher, and general freight-agent; but at the larger stations scrubbers and cleaners are employed by the year.

The employés and officials of a big railway must have pens, ink, paper, and even pins. The quantity of pins bought by the general housekeeper and distributed to the employés weighed over three thousand pounds. Forty thousand pens were also used, and fifty barrels of ink. There were enough lead-pencils used to reach from Chicago to New York and half-way back again if they were placed end to end. The care of the linen of a single trunk-line is an important task. No hotel or series of hotels offers a comparison. The napkins and table-linen for the dining service of this railway mount up to thousands of pounds, and the towels and bed-linen for the sleeping-cars represent nearly as many more. The annual laundry of the sleeping and dining car service amounts to an expenditure of five thousand pounds, although it is nearly all done by steam machinery. To keep up the supply of linen, upwards of ten thousand separate pieces of linen are purchased annually. On this line more money is spent on the table and bed linen than on such apparently important articles as car-brackets for hats and coats or cushion-seats for passengers. Yet so careful is the system that every napkin, towel, table-cloth, sheet, or pillow-case must be accounted for, and not one can be lost without some adequate explanation.

So numerous are the dining-cars and café-cars on this railway that to supply them with all the necessary provisions and articles of diet to suit the most fastidious the general housekeeper purchases wholesale quantities all along the line. This railroad system will want upwards of fifty thousand barrels of flour a year for the dining-car service, forty thousand pairs of poultry, ten thousand quarters of beef, and tons of fruit, pastry, coffee, and vegetables.

The equipment of depôts with slot machines, literature, and restaurants has greatly increased the labours of the housekeeping department. In some instances the concessions are sold to private companies; but on this railway the rights to sell articles along the route are retained by the transportation company. In one year two thousand pounds were taken in the penny-slot machines for chewing-gum. This meant that a million and more American pennies were dropped into the machines. The supply of literature by the railroad company is enormous. Upwards of five thousand train-boys 'hawked' the periodicals through the cars as licensed sellers, and half as many more sold books and magazines at the different stations. Over a million pounds sterling was obtained last year through this source. The distribution of literature over the whole route is a matter of exact business routine, which is managed entirely by a single head. Candies, fruit, sandwiches, and other similar edibles for the delectation of travellers are important items. This line annually sells over its route half a million pounds of candy, nearly twice as many sandwiches, and upwards of five hundred tons of fruit. This does not include what is sold in the waiting-rooms and restaurants of the stations. Here probably as much more sweets are disposed of to hungry passengers. A million bottles of drinks is the annual bill, or rather the amount that thirsty passengers dispose of while waiting for trains. The restaurants on the line will use upwards of fifty carloads of provisions in the course of a year.

If we added to the general housekeeping economics of a railroad the items which pertain more distinctly to the gardening or landscape department we should find more interesting statistics. Every railroad has its landscape-gardening department to-day, and tens of thousands of plants, trees, and shrubs are planted and cultivated every season.

The company we have cited actually sets out nearly a million bedding plants every season to decorate the grounds around the stations, and another raises cut flowers, so that every office and important depôt is supplied with fresh cut flowers every day through the summer season. Ten thousand bouquets are weekly distributed for table decoration on the dining-cars. It costs money to support this department, but the indirect results are apparent in the approval and increased travel of patrons.

But the amount of money which the railway housekeeper gets from the sale of what is called waste material (that which is of no further use to the company) is astonishing. Again referring to this American line, from waste-paper alone in one year it realised a profit of one thousand pounds. Pens, shingles, and nails proved of important value. The total sum of the 'scrap-heap' of old machinery reached the enormous figure of two hundred and fifty thousand pounds. Of course the greater part of this waste came from the worn-out locomotives and cars which are sent to the scrap-heap after they have ceased to be of further use to the company. But on the small 'household items' mentioned upwards of twenty thousand pounds was realised. Everything is saved, and everything is economically disposed of. Even the ashes are sold or utilised for improving the roadbed.

THE HOUSE IN ISLINGTON.

By W. E. Cule.

IN THREE CHAPTERS.—CHAPTER I.

'PHILIP,' said Mrs Burchell timidly.

'Yes?' muttered Mr Burchell from behind his *Telegraph*.

'My little cheque came last night. It is just fifteen pounds. Is there anything'——

She did not complete the sentence. There were many of those unfinished sentences on Mrs Burchell's side in her relations with her husband, and they increased in number yearly.

For a few moments there was a silence which might have been described as strained, and then Mr Burchell smoothed his paper with an ominous rustle. He had decided to speak out. 'My dear girl,' he said, with a distinct rasp in his voice, and with a finality which he almost intended to be cruel, 'let us settle that matter of the House in Islington once and for all. Twice a year regularly you receive your little cheque, and twice a year regularly you insist on asking whether you shall buy me anything out of it. I hope—I sincerely hope—that I appreciate the attention as I should; but I wish you to understand now that it is utterly unnecessary on your part, and that it need not be offered again. It is your own money, and I refuse to touch it. Use it entirely and absolutely for your own purposes. In future I shall not expect you to mention that you have received it.'

There was a painful pause. Mr Burchell did not lower his paper, but he knew that his wife had smiled—one of those small smiles with which she was accustomed to disguise her feelings. When she spoke it was as gently as ever.

'Of course, Philip, if you wish'——

'I do wish,' said Mr Burchell firmly. 'Let that be enough. I must not be worried with trifles—not even twice a year!'

Trifles! There was complete silence after that, except for the inevitable movements of the breakfast-table. Mr Burchell spent another two minutes over his paper, and then looked at his watch. Five minutes later, well clad and well groomed, he passed down the path that intersected his faultless lawn and turned into the street. It was now twenty-five minutes after nine, and he invariably caught the nine-thirty-six at Highgate Station. From the dining-room window Mrs Burchell watched him go, and he acknowledged the attention by a careless nod as he disappeared.

'Women,' he said to himself in injured self-excuse—'women seem to have no sense of proportion. That House in Islington! year after year in just the same way, as if we were still striving to live on a hundred and eighty pounds. I am afraid Mary is a woman of one idea—or rather, a woman of a dominant idea. That's it—the Dominant Idea. She can't get away from it.'

So he strode on along the shaded road, and in the house that he had left his wife returned to the breakfast-table to finish her last cup in unprofitable meditation. Naturally, it was the House in Islington that claimed her thoughts, and she retraced its story in a mood of mingled pain and self-blame. Her face was not yet an old one, and its patient gentleness was her passport to the trust of any who came near her when they were in need of a friend; but at this moment something had picked out certain lines in it with a pitiless pencil, and she looked much older than the well-groomed City man who had just left her.

Twenty years ago, when Philip Burchell had asked her to be his wife, she had come to him without any great beauty and with a somewhat keen sense of her own shortcomings. He was an extremely able young man, and she had wondered in her heart of hearts that he had chosen her. So she had kept a secret for him, and it was not whispered until the day after their marriage. 'You thought I had nothing, Philip; but it is not quite so bad as that. There was a little property left by my grandmother, and after my uncle's death—he is very old, you know—it will be divided between my cousins and

myself. I shall have one-fourth — and it will probably be the House in Islington.'

She remembered with vivid clearness his real pleasure and his exaggerated surprise. He had rallied her upon her 'fortune' all through the fortnight of that humble honeymoon, and she had enjoyed the situation even more than he. After all, she had something to offer him, something that would be a great help in the heroic struggle he had begun. No, she could not help him much herself—her scope was limited, and she could only stand and watch. But the House in Islington would help, and he would take that as a part of her contribution to the common fund.

It was curious to remember how differently things had worked out. The life that stood between had ceased in the first year of their marriage, and the House was nominally hers; but then had come a long period of delay, and even when that period was over it was found that legal expenses had swallowed up nearly the whole of the first year's proceeds. She remembered how Philip had pinched her ear consolingly when that disappointing five-pound note had come. But it was a beggarly five pounds in the second year too, for the property had long been neglected, and extensive repairs were necessary. So those first years of their married life were full of calculating and contriving, with the House in Islington like a tantalising shadow in the background.

The third had been the year of the greatest need —a need so urgent that they had tried to part with the House to one of the cousins at his own figure. It had produced ten pounds that year. The cousin had declined, and the House had begun to assume something of a sinister aspect with relation to their fortunes. But then things changed quite rapidly. Philip improved his position, and the upward march began. At the same time the House, as if in ironic sympathy, had shaken itself clear of misfortune, and had begun to pay thirty pounds a year. Actually, thirty pounds a year! Yes, that was the irony of it —that it had begun to do fairly well as soon as the keen necessity was passed.

The rest of the story was very similar. In the first year of success Mr Burchell had accepted from the House a pair of boots—an excellent pair of the best American make at one guinea. He had never had such a pair before, so the House had begun to be a real practical help; and although Mr Burchell wore those boots for two winters, it is safe to say that it was his wife who found the greatest pleasure in them. Her eyes were on them often, and she regarded them as a first-fruit of her many expectations. But, alas! the chance never came again. Even before that pair was worn down the partnership had come, lifting their wearer high above all considerations of footgear, and setting his feet in the broad way of prosperity and self-esteem. On the arrival of the next half-year he had playfully announced his independence, blind to the pain he was giving, stupidly unaware of the true inwardness of things. 'No, my dear girl,' he had said blandly, 'I will not accept a penny. It is yours. Buy things for yourself.'

Something — perhaps the knowledge that he would be amused—had forbidden an explanation, and he had persisted in his refusal. She had tried one or two pleasant surprises; but he had shown annoyance rather than pleasure at such evasions of his will, and that method of procedure had had to be abandoned. So for the last ten years she had simply offered him a gift, and he had as simply, but very firmly, declined it.

In the meantime some vague fear of hers had gradually been realised. The City had year by year cast a heavier spell upon him, and he had become more and more engrossed in his business, less and less interested in his home and his wife. Inevitably, as his character hardened and his views of values changed, he had allowed a gulf between them to widen, and had made no attempt to bridge it. Brusqueness and impatience, absent-mindedness and self-absorption, the City column at the breakfast-table—all had been signs of the tendency she had seen a long way off and could not prevent. In a sense she had centred her hopes in the House in Islington, feeling that such a contribution to the common welfare would always claim his respect and gratitude, if nothing more. But the House had failed egregiously in its mission, and on this account she could claim nothing. To-day he had, as he had said, settled the matter once and for all.

She could forgive him for the way in which he had done it; she could even overlook the fact that he had described it as a trifle. A trifle! But she would not forget the fact that she must not mention the matter again. The last hope was gone, after having been many years agoing.

So she sighed gently, and then blamed herself for desiring the unattainable; and with a faint smile upon a face which had not yet lost its sweetness, she rang the bell for the maid and turned to the duties of the day.

CHAPTER II.

SEATED in his first-class compartment, Mr Burchell again attacked his newspaper to cover the last traces of his breakfast-table outbreak. He was not sorry for it—indeed, he had not the slightest difficulty in finding full justification; but it had been unpleasant, if necessary, and he was willing to forget it.

He was able to complete his examination of the City columns, and might have done more if he had not been interrupted. Conversation in a first-class compartment on the nine-thirty-six was sufficiently unusual to be noticeable, sufficiently disturbing to be resented. He could scarcely help hearing in some subconscious fashion, much as he desired to avoid it.

The two men who conversed were City men, and

he knew them both by sight. Their talk was market-talk of an ordinary type, but to him market-talk was always interesting. Moreover, this conversation seemed to be somewhere in the region of his own business, though he would hardly have said how he became aware of the fact. The noise of the train was such that only imperfect phrases reached him.

'I heard a rumour last night,' said the nearest man; '. . . are in trouble. Heard anything yourself?'

'Not a word. What was it?'

'Oh, . . . deal—South Americans—pulled them all to pieces. Won't open to-day probably.'

'Others will go with them,' suggested the second man callously.

'Certain! . . . and more than one. There will be a slump in that line for a time.'

The conversation went on jerkily; but Mr Burchell had ceased to follow it, as the topic was changed. He had failed to catch the name of the firm under discussion, but it seemed to have been one full of labials and sibilants. Of course there were several names of a similar character, and it was quite unreasonably that his mind sprang to Bassetts, and persisted in staying there. South Americans, too! Then he thrust the suggestion aside with an emphatic refusal.

'Rubbish!' he thought impatiently. 'That's out of the question. South Americans—absurd!'

A few minutes later he was in his own building and in his own room. The atmosphere was exactly as usual, and it was not until he had opened his letters that he called in his cashier, an experienced man of advanced years.

'By the way,' he said, 'have you heard anything about Bassetts—in connection with South Americans?'

'Bassetts? No, sir, not a word!'

'Very good. It must have been some other house.'

Two minutes later he was at the telephone, making the same inquiry elsewhere. 'Bassetts?' came the reassuring answer. 'No—nothing. What have you heard? *They're* all right.' But then he called up another number, to receive another reply. 'Bassetts? Yes, we've heard. They're closed this morning. . . . Hope you're not in with *them?*'

He left the instrument after a moment, and recalled the cashier. 'Bassetts have gone,' he said calmly. 'There was a South American muddle after all. They are bound to drag others with them. I expect we shall hear the worst by noon.'

The man retired dumfounded, and Mr Burchell drew his handkerchief across his brows before he turned to the work of the day. Long before the cashier's task was completed he had gone out, and it was some time after noon before he returned. Then he called the man again.

'Gillinghams are as good as gone too,' he said. 'It was bound to be, and Trescott is certain to go. Lambtons will, I believe, stand. You can go into the whole matter now, and get at the total loss. There is no hurry about it—any time before five will do.'

The cashier had lost his nerve long ago, but his employer's manner steadied him. He seemed to see a man standing in the midst of a quaking house and propping up the walls by sheer force of will. He retired again after asking a question or two, and the routine of the day was proceeded with.

At four a foolscap sheet of figures was laid on Mr Burchell's desk by a hand that trembled. He scanned it closely, without a sign of emotion, and even checked the totals with that cool precision which his wife knew so well. He transferred the final calculation to his pocket-book with the same care.

'If you will allow me, sir,' said the elderly cashier, in earnest agitation, 'I should like to express my regret—and my sympathy.'

Mr Burchell seemed a little surprised. 'It is very good of you, Simms,' he said pleasantly. 'Very good! Yes, this must be, of course, a serious check. Thank you.'

'A serious check!' muttered Mr Simms as he returned to his own desk. 'A serious check! Well!' And it was with feelings of mingled respect and pity that he saw Mr Burchell pass through the office later, on his way home, precisely at his usual time. The proud front of the beaten fighter is good to see, but it has its painful aspect.

Mr Burchell walked to his usual train through the thronging City. There was in his bearing no betrayal of dejection, no shrinkage of dignity and confidence, and it was an unmoved face that he turned upon the scene of his misfortunes. 'You have struck hard,' he seemed to say in farewell, 'but I shall be here again to-morrow!' And if the defiance found an echo in the groan of a stricken man, it reached no ears but his own.

CHAPTER III.

BEFORE he reached Highgate he had fully realised the whole extent of his losses, but had no spirit to begin to rebuild. The shock found him lacking in that power of recovery which had brought him triumphantly through earlier crises. On his way home from the station he turned into the Queen's Wood, to find a little solitude in the leafy alleys where he had often planned his business enterprises. Then after a while he went quietly to his house.

At this point he seemed actually at the nadir of his fortunes, and bitterly conscious that it was beyond his power to right them. It was not until he approached his own gate, however, that he thought of his wife at all in connection with the blow, and then his pity was curiously tinged with something much less noble. He might explain, but she would not understand. It would be useless to give her any details. He knew so well what her

limits were. And in the bitterness of his defeat it occurred to him to make a study of the woman at this crisis. He would tell her the truth, and would observe the way in which she received it. It was a pity that she could not enter into his schemes a little more, that her limitations were so definite. She would have nothing to offer in the way of ideas—nothing.

He discovered now that the day's experience had quickened his perceptions to an almost painful extent. He noted, as for the first time, the beauty and tastefulness of his garden, the substantial structure of his house, the richness of his windows and of his hall. They looked different, he thought, because he saw them under the shadow of possible loss. In the morning-room, overlooking the garden, his wife was sitting, and she smiled a greeting as he passed. A moment later it occurred to him that she was almost always there. With a little impatience, he found himself making the acknowledgment that a very domestic wife was sometimes an advantage. It was an advantage to have her in her place on this particular evening, even if she had no ideas to offer.

Entering the room, he went to a couch and sat down where he could see her face. He was still intent upon his purpose. His wife looked at him in silence for a moment, and he observed—because he was there to make observations—a certain timidity in the look. At once he felt a little surprised. Surely he had never given her cause for timidity!

'Have you had a good day?' she asked gently.

That was about as far as she could penetrate into his business affairs, he reflected; but an instant later came the further reflection, 'She always asks that. But she never forgets to ask that.' And then he answered simply, 'No; a very bad day. The worst in twenty years.'

He spoke so calmly that she had to search his face for an endorsement of the statement. She lowered her work with a troubled look, and waited for more. With all her limitations, she seemed to have a faculty for reading his features.

'Three firms heavily in my debt,' he said, 'are closing their doors. The end of it is that I am very nearly ruined. Practically, I have lost three-fourths of all I had.'

She certainly seemed to take it seriously enough, he thought, for she sat as if transfixed. Then he saw, very clearly, her effort to comprehend the meaning of such a disaster, and looked to see horror and dismay in her eyes. He saw neither, and for a moment failed to realise what it was that he did see. Could it be that she felt no horror of loss, no fear of the future, only an overwhelming and infinite pity? And pity for whom? For him? He knew as soon as she spoke.

'Oh Philip!'

He was certainly seeing something now. The pain in that one exclamation was inexpressible, and he stirred uneasily under the knowledge of it. He wondered that she did not come to him, and somehow his conscience connected this with something he had noticed previously—her timidity. But then she spoke further, the words issuing from her lips unconsidered, unmeasured. Indeed, she had never intended to utter them aloud.

'The House in Islington—I will sell it'——

She stopped, suddenly conscious that she had spoken, and aware of an immense folly. The silence that fell was painful. Burchell raised his head a little to stare at his wife, and she fluttered and trembled. As for him, he almost laughed, the thing seemed for a moment so grotesque. But then, looking still at her face, he checked himself.

With his unusual keenness of perception, a not unnatural result of his terrible experience and his new relation to circumstances, he saw everything that came. Moreover, he was impelled to examine everything that came, to study it with an almost morbid desire for truth. That one phrase, 'The House in Islington'—how banal, how foolish, how suggestively characteristic! Yet at once his mind fastened upon it for absolutely the first time, and in the space of a minute its whole significance was laid bare to him.

The House in Islington! In an instant he was back in the beginnings. He remembered how she had revealed her little secret on the day after their marriage, the shy pleasure and pride in her face as she told the story, half-expecting his surprise and delight, half-afraid that he would scold her. 'You thought I had nothing, Philip, but it is not quite so bad as that. I shall have one-fourth, and it will probably be the House in Islington.' And then they thronged upon him swiftly—soul-stirring pictures and echoes of the days that followed—the joys and hopes of their early housekeeping, the efforts to make the ends meet, the long, dark days of heavy toil and straitened means and abounding hope, with the House as a shadowy stand-by, giving so little, promising so much. He remembered that she had never called it *her* House, never claimed it as hers apart from him; and yet, in a way, she had regarded it as her own, so that she might give it to him freely. And in those dull days he had never noticed her limitations!

The House in Islington! Was there any limit to the content of those four words? Looking at her face, with its eloquence of pity, he swiftly linked those old days with these new ones—nay, with this last of all, this moment in which he sat and watched her. The phrase was pregnant with significance, full of revelation, for he saw her last words not as the helpless outburst of incapacity, but as the key-note of a life, the crowning words of a story extending over many years. It was the sum of all her aims, a motto, as it were, that covered all her thousand silent sacrifices of self, her timid, unfinished sentences, her patient smile. And she had offered him her poor little House year after year since, as the emblem or perhaps the materialisation of a devotion that found in this its most hopeful form of expression. And he? He realised

now that he had failed to see the meaning of the offering, had turned away from it and contemned it. Only to-day, in his pride of power and prosperity, he had finally thrust it away from him, and had even trampled upon it. He could not be worried with trifles. Trifles! That persistent and indescribable devotion!

The House in Islington! Yes, revelation brought self-revelation in its train, and he saw the real cause of her vague timidity, her silences; and, as if in contrast, he saw again the quaint pleasure she had found in the one gift he had accepted from her since the tide had turned—that wonderful pair of boots. He did not remember it now with amusement. Quite clearly he saw the House in Islington for what it had always been from the first day to the last, and the truth struck him with the force of a blow.

Unaccustomed emotion gathered in his throat and dimmed his eyes. That flash of perception dissipated a thousand vapours of vanity and self-esteem, and stirred into sudden life the older, nobler spirit which had lain so long under the deepening spell of the world and the City. He had reached a bad pass, indeed, that he had failed to see so much, had been so blind to the tragedy of his own hearth!

'Come here, Mary,' he said huskily.

She came, half-afraid and fully ashamed of her blunder. But he drew her down to his side, and did not afterwards release her hands.

'You are very good, Mary,' he said in slow and laboured words. 'I will not have you sell the House. We must keep it in the family—it is too precious to part with. But I shall be glad of what you may be able to spare me from it.'

She could see that he was not jesting, and her incredulity grew into wonder. He went on, growing stronger moment by moment, a better spirit rising from the ashes of his shame. He was minded to attack life again, to reconquer it so that he might prove himself worthy of the love he had seen revealed to him and at last had realised. And under this influence other things fell back into their true perspective.

'Still,' he said, 'I do not think these losses will break me. I am not broken as long as you are here to help me—as you have always done.'

Slowly and doubtfully her wonder grew into joy. Now he was smoothing her hair—a little awkwardly, with an unaccustomed touch—and scanning her face with strange intentness. Perhaps there were no lines there that might not be smoothed out.

'But — but I am so sorry, Philip!' she murmured.

Rapidly, in the new light he had been given, he summed up what he had lost and what he had gained through his losses. It seemed to him that it was his disaster that had placed in his hand the key of a better future, and he answered simply, 'I am not sorry. I am glad!'

And thus it was that the House in Islington achieved its mission.

THE PIONEER.

There is a legend that the Roman Legion stationed at Jerusalem at the time of the Crucifixion was afterwards removed to Lincoln.

The hurrying moon, flying through ragged clouds,
Cast hard black shadows on a sleeping world,
And fired the Roman Eagles that kept watch
On flags of victory by the wind unfurled.

Save for the wailing wind from distant seas,
That sighed about the camp upon the hill,
And for the mournful sea-birds overhead,
The silent midnight world was calm and still.

The furtive light, that glanced through silvered clouds,
Gleamed where a soldier, leaning on his spear,
Heard in the rising wind, through rustling leaves,
The slow departure of another year.

Stern, self-reliant, and remote he stood,
An exile from the pomps and joys of home,
Maintaining order in a lawless land—
Symbol of all the majesty of Rome.

His the hard task that waits for pioneers,
And only master-nations get by heart,
To pay the debt those crowding shades demand
Who claim through death that they have done their part.

His fate the loneliness of those who hold
The wrested mastery of half a world,
Who mete out justice with an iron hand
Wherever their unconquered flag is furled—

Harsh, ruthless justice to a conquered race,
From each man standing at his lonely post,
Who holds his own at price of life or death,
While far-off Rome pays the tremendous cost.

Resolved and calm, he heard the call of Rome,
Dreamt of the honours waiting those at hand;
While his to hold barbarians in thrall,
And die forgotten in an unknown land.

The full, round moon that fled through fraying clouds,
Called up a memory from the vanished years:
A cross-crowned hill, where loud-voiced, mocking cries,
And women's bitter weeping, filled his ears.

Again the shouts he heard, the taunting priests,
As he kept watch upon that alien sod;
Again the awed Centurion by his side
Murmured, 'This surely is a Son of God.'

'A Son of God!' The half-remembered words
Sighed in the wind, as once on Calvary;
'The man may die, but courage never dies,
It haunts this land without a history!'

The Roman heritage of conquered worlds
Flamed in his past—a blaze of victory;
But for the island set 'mid northern seas,
Its glory was unwritten history.

Unbuilt the gray cathedral's sheltering walls,
Unhewn the cross, unlit the golden lamp,
Where the proud Eagles kept their tireless guard,
And the stern Roman watched the sleeping camp.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE end of the busiest season that London or any other place has ever known approaches. We speak of the season in the larger meaning of the term, for the higher social and very restricted part of it faded away at the proper time some weeks ago. Many of the 'smart set,' as they are named, tarried a little longer than usual, for London has never been so alluring, even to its own people, as it was this summer; but by-and-by all went away, and the blinds in Mayfair were drawn down. At the moment even the busier folks who recognise no season are enjoying their annual change in other places, and the town is more than ever in the possession of the foreigners. A cosmopolitan city indeed! There has never been one, we may be very sure, that contained within the same period so many foreign people of so many different nations. Circumstances have never conspired towards such a congregation as they have done this summer on this island. Comparisons in figures cannot be made; but it may be said with sure conviction that until this London season came the distinction of having held more strangers within her gates for a few sunny weeks than any other city was held by Paris in virtue of her achievement on the occasion of the last great Exhibition in the fair capital of friendly France. Then we may think that there is something appropriate in this taking of the honour by her brother Britain. Despite all the ambitions of the great French through history, right up to the grand climax but sorry failure of Napoleon, France has never come so near to the possession of London as in these days of the most perfect peace. She has never had so many of her sons and daughters in occupation of it; they have never been so entirely in command, with the English their most obedient servants. The other evening, one who entered a tram-car on the Embankment found that of the nine people it contained six were French, two were English, and one was Italian. Pondering on this curious matter, he may have gazed a little stupidly at the conductor as he came along for the fares, whereupon that official showed a halfpenny, and said, 'Sank senteem' with an accent that sounded as if it would improve in time. Never until this year have the ordinary servants of the general public in Britain spoken any language but their own, and it is the sign of the most complete French occupation that the language is spreading. In all the shop windows you see the notice that they speak French inside, and railway porters, attendants at places of amusement, and so forth, all have a useful word or two at their disposal. This is a rare condescension from our insularity. It is not merely that by many general impressions we are brought to the certainty that there are far more people in London than there are usually; but we can see them, the excess, in the streets and in all the public places. Save on special days of celebrations we have never witnessed such a packing of humanity. There is a plain difference between the normal crowd and bustle of London and the crowd of this season, a difference which has never been apparent in this way before. The mind shrinks from the roughest calculation of how many people have been tramping and how many wheeled vehicles have been directed through the great metropolitan thoroughfares lately. At ordinary times the number is immense. Some official tests that were made at one time showed that from eight o'clock in the morning until eight at night no fewer than twenty-nine thousand three hundred and twenty vehicles passed the Marble Arch, and that in the busiest hour there were three thousand and sixty-nine. Nearly as many passed Hyde Park Corner, and it was found that the next busiest spots in London, in order, were Charing Cross, the Bank, Piccadilly Circus, Ludgate Circus, Piccadilly at St James's Street, and the Strand at Wellington Street. This was about a year ago; but a combination of circumstances has lately served to make Pall Mall one of the busiest and at the same time one of the most dangerous thoroughfares in London. Our visitors have contributed materially to this

 [*All Rights Reserved.*]

state of things. The other day a census was taken of the vehicles passing at the western end of it, near to St James's Palace, and it was found that in the short space of five minutes two hundred and fifty-four cabs, fifty-one motor-cars, thirty-eight carriages, and seventeen vans and carts rolled past the point. This was at about four o'clock in the afternoon. Half an hour later an interesting test was made of the number of people who for five minutes were delayed in crossing the thoroughfare from one point to another at the place where Pall Mall touches the southern end of the Haymarket. It was two hundred and eighteen. Such figures may perhaps convey some notion, even though a vague one, of the amazing thronging of London in this season. A sense of great excitement has generally prevailed. There has been the feeling that somehow mankind has been going forward. It is all very wonderful, and one must reflect again that it is the outcome of the work of a single individual. It is the work of the great royal thaumaturgist, the peacemaking King.

* * *

If you had to select a man from each service who should be regarded as the most typical Briton, possessed of the best British qualities in the greatest abundance, there could hardly be a doubt about the two who would be selected, for the public has one special idol in the army and another in the navy, and nothing will shake its belief in them. Lord Kitchener and Lord Charles Beresford hold unique places in the affections of the people; they are in a class apart from others. The great Admiral and the great General have very much in common, and it has happened curiously that during the last few months they have been more than usually prominent in affairs and have been the subjects of earnest discussions—Lord Charles Beresford by reason of certain incidents occurring in the course of his command of the Channel Fleet; Lord Kitchener in connection with matters arising from his control of the army in India. With the rights and wrongs of either matter there is no occasion to concern ourselves now; it need only be said that it would take many more incidents to make the slightest impression on the public faith and affection for either man. What is specially liked by that public in the Admiral is the fine human nature of the man which constantly shows itself in many and diverse ways. Thus, we are told, never was there such an Admiral for having pets on board his ship with him. Three or four years ago, when the *Cæsar* was his flagship, he had with him a seven-hands-high Shetland pony, his old bulldog Bill, and a raven, all special favourites and all receiving the best care of marines who were told-off to look after them at special times. Animals like him instinctively. When he was on the *Galatea*, under the late Duke of Edinburgh, an elephant was brought home in the ship which only he could manage; but he, indeed, in the short space of one voyage, taught it a large number of tricks and so disciplined it that it would stand on its hindlegs or lift one leg just as it was told to do. His sailors like him because of his special and humane consideration for them at all times and because of his intensely practical nature. He can do anything that they can do. He once said himself that there was no task on a man-o'-war, from stoking upwards, that he could not perform; and he added, 'I've cut out and made no end of jumpers and trousers, and could sew a hundred yards of canvas to-morrow if necessary.' It need hardly be said that it has always been a part of his system to make the people understand the navy and all that pertains to it as much as he possibly could, and at all times to grant facilities for public inspection of the ships under his command. Some officers do not like the lay landsman looking about on deck and asking questions; but the sentiments of Lord Charles Beresford in this matter are those that he expressed to the Mayor of Yarmouth on one Saturday when his fleet had anchored there for the week-end. 'You may swamp the ships both to-day and to-morrow if you like,' he said; 'the people pay for them and ought to see them.' There is one striking temperamental difference between the two men we have mentioned, in that while Lord Charles has a wonderful breeziness of disposition, Lord Kitchener is one of the most silent, reserved officers in the service. Hardly any other disposition would properly suit the thoroughness and the determination which are the constant characteristics of all his work. There is a general feeling that not for a long time has the army had a General who has so much power over men as this one has, and who inspires them so much with his own determination. Innumerable stories are told of him in this way, and perhaps the best we remember is that concerning the piece of work that Lord Roberts, before he left Capetown, in the course of the South African war, instructed a certain colonel to take in hand. 'I know you'll do your best; how soon can you get it through?' asked the Field-Marshal of the colonel. 'I'll try to finish it in a fortnight,' was the answer, and Lord Roberts, murmuring another expression of his confidence in his subordinate, dismissed him. But it happened that just outside the door he met Lord Kitchener, who was going in to see the chief, and he explained the mission with which he had been entrusted. 'And how soon will you get it through?' asked Lord Kitchener. 'Well, I have promised to try to do it in a fortnight,' he responded. 'Now, colonel,' said Kitchener, 'just understand that if this is not done within a week we shall have to see about sending you home. You understand?' The colonel said that he did understand. Without a doubt he did, and it was because he did that the big job he had taken on was finished, and finished very well, in six days.

* * *

There have been some good stories told lately of the Parliament Whips, and they are more or less appropriate to a time when, as they will tell you down at Westminster, the work of these Whips is heavier and more difficult, while at the same time it is more humdrum and less interesting than for a long time past. Whipping for any party is naturally attended with more difficulties than usual when, by reason of a great majority on one side, the results of divisions are frequently foregone conclusions. Then, it is to be feared, a large section of members, chiefly those of the more experienced kind, who knew the House of Commons in what they regarded as happier days than those which are lived in now, do not take the same interest in their parliamentary work as they used to do. Whatever may be its merits, the increase of Socialism will not contribute to the dignity of the House; and though Parliament may be a better piece of legislative machinery now than it used to be—some people say so—it is probable that it does not now attract the best type of politician to it quite as it used to do, and it is likely that it will attract him even less in the future. However, even in the dullest times there is some colour in the life of the Whip, and that is certainly an excellent story that one of them has just told of something that really happened only two sessions ago. This Whip, being Mr J. A. Pease, the chief on the Liberal side, missed seeing a certain hon. member who indeed took part in every division during an all-night sitting, but in the intervals snatched what sleep he could get in a quiet part of the House. So the Whip sent a telegram to his house thus: 'Come down at once and relieve the guard and those at work all night.' In due course the long sitting came to an end, and the member, who had faithfully voted all through the night, sought his home at eight o'clock in the morning. 'Where have you been to?' he was asked by his wife. 'I have been at the House at an all-night sitting,' was the truthful answer. But the lady, of course, had opened the telegram, which clearly indicated on unimpeachable authority that her husband was not at the House, and this telegram she duly produced from under her pillow with a withering remark, 'So you see it is no use your telling me lies!' But one of the best whipping stories of all is one that we remember Lord Alverstone, the Lord Chief-Justice, telling on one occasion. Whips arrange the pairing of members who desire to be absent from the House, and such a pair was made on one occasion for an important sitting when a division of much consequence was taken. When the division was over the Whip on one side said barefacedly to his opponent on the other, 'I think I ought in justice to explain that my member broke his leg this afternoon, and so could not attend.' Of course no pair would have been arranged for a man who was thus absolutely unable to turn up; that is a contingency in which he and his party must suffer. The other Whip was not upset at the information of fraud. 'You bad man!' he said, 'I will forgive you; but I only do so because my man, whom I paired with your man, is dead!'

* * *

It is partly because of the established and recognised professional reserve of the doctors and surgeons, and partly because of their unwillingness to encourage the public to think that they can achieve more than is well within their compass, or can at all times perform their most successful and brilliant feats, that we hear so little of the wonderful things that are being accomplished every week, almost every day, in the alleviation of suffering of the human body. In America this professional reserve is less strict than it is here and on the Continent, and the result is that we constantly hear of the most wonderful discoveries being made by the doctors there, and of operations being performed which are as succesaful as they are daring and sensational. Nor is it to be assumed that all or even an appreciable portion of these stories are either untrue or grossly exaggerated, as some people might be led to suppose; since, as they naturally think, our own doctors are surely as clever as theirs, and yet we do not hear of their doing such great work. The fact is, as already suggested, that it is done in Britain perhaps more frequently and successfully; but it is kept as secrets of hospitals, and accounts of methods and results are only communicated to those whom they particularly concern. Operations are performed, as we have been assured, in the London hospitals almost every week which, if the truth concerning them were issued at once to the public, would constitute the most sensational items in the evening newspapers. They think nothing now of skin-grafting. A little while since one of the most popular actresses of the day met with an accident through an explosion of benzene, as the result of which her arms were severely burnt and some permanent disfigurement was threatened. But she was taken to the Charing Cross Hospital, and there under an anæsthetic large patches of skin were removed from her legs and grafted on to the burnt arms, which are now just as they were before the accident. One of the most extraordinary cases of artificial replacement occurred in Paris a few months back, when Dr Delair presented to the French Academy of Medicine a living man with a complete artificial face made chiefly of india-rubber and screws. This man had been in a shooting accident, as the result of which his chin, the lower part of his jaw, his lips, a piece of his tongue, and the whole of his upper jaw and nose had been blown away. These were all replaced by artificial parts, including a most wonderful dental apparatus with which the man was enabled to masticate his food perfectly, india-rubber chin, lips, and nose; the whole being contrived so excellently that at a distance of a few feet the appearance of the face is said to be quite natural. The man, who now enjoys excellent health, takes off his artificial face and washes it every day. The liberties, as one

might say, that surgeons in these days find themselves able to take with the heart, which at one not very remote time seemed to be beyond their touch, are amazing. They can lift the heart from the body, cut it, stitch it, squeeze it—do almost anything with it; and it is of another feat that the surgeons have performed with this organ, one of a quite new character, that we come to speak of particularly in this paragraph. It occurred lately in a large general hospital in London, and the circumstances have not been generally reported. A patient was suffering from a form of heart disease which came as the result of a very great enlargement of the organ. He had become possessed of what is known as a 'bullock heart,' and he was constantly in the severest pain. The doctors argued reasonably that these attacks were due to the enlarged heart not having sufficient room in the chest in which to beat properly. Now, if the body were a machine made of iron or wood the remedy would be obvious—cut out a space and give the heart more room. The surgeons pondered as to how they might apply this principle to the living body, and eventually they did apply it. They conceived a scheme for cutting out parts of the body surrounding the heart, and communicated it to the patient for his permission for them to operate, explaining to him the probable dangers of the business. He gave his consent, and they proceeded with what was certainly a daring enterprise. What they did was to remove four and a half inches of the fifth rib and five and a half inches of the sixth rib on the left side, and this gave much greater freedom of action for the enlarged heart. Then the body was closed up again, and the patient made his recovery. The result has been excellent, for the pain has ceased, and the man now gets long nights of refreshing sleep instead of nights when he was tortured throughout, as was the case before.

* * *

There are some curious stories of 'London in the Sixties' in a book lately published by Everett's under that title. It has been written anonymously by 'One of the Old Brigade,' being a gentleman who held an officer's commission in a distinguished regiment. In a chapter dealing with army matters he mentions that military examinations for direct commissions in those long-ago days were held at Chelsea Hospital, and extended over a week. On the occasion of the author's public appearance an extraordinary incident occurred. 'Every precaution, it was stated, had been taken against the papers getting into unauthorised hands, but hardly had the first day passed when every candidate was aware that the tout of a sporting tailor was prepared to sell the paper of the day correctly answered at two pounds a head. The conspirators met at the Hans Hotel, and donkeys incapable of spelling, and with no knowledge of any language but their own, passed examinations worthy of a senior wrangler. The miscreant who thus tampered with her Majesty's stationery was one Pugh, and his employer (if I remember rightly) was one Cutler; but the golden shower came to an abrupt ending, as on one fateful morning (the last day) General Rumley ascended the gallery, and amid the silence of the catacombs briefly announced: "The late examination is cancelled; candidates will attend again next Monday." The consternation that ensued is beyond description. Jolliffe, who, I believe, had been measured for his uniform, did not join us for at least a year after, and poor old Plummy Ruthven, who couldn't spell six words correctly, abandoned all further idea of the army. He was sitting next me on the first day of the examination, and I remember as if it were yesterday his whispered inquiry as to the correct reply to a mathematical question: "At what time between two and three are the hands of a clock opposite one another?" The reply, it is needless to add, had to be "worked out" by figures; but, thinking in the excitement he was asking the time, I hurriedly whispered, "Twenty minutes to one," and down it went on poor old Plummy's paper. During the subsequent days his papers, I fancy, were vastly improved, as he was a constant visitor at the Hans Hotel.'

A PAWN IN THE GAME.

CHAPTER XLII.—ON THE ROAD HOME.

MEANWHILE, the *Robert and Mary*, on which Jack sailed, was butting her slow way against contrary winds along the whole length of the Mediterranean and round the coast of Spain. The slow, eventless days were for Jack an intolerable weariness. He had no Grant with his unquenchable cheerfulness beside him, and no softly smiling face of the woman he loved before him. The captain was a rough merchant-seaman, with no thought beyond the daily run. Jack himself was in a lonely mood, and he paced the deck day after day with restless feet and a fretting heart. He had lost since he last crossed these waters, he sometimes reflected, three years of his life.

Or had he lost these years? his wiser thought demanded. The Bedouin camp, the cruel desert, had been for him a school; they had the office of fire and water on steel—they had tempered his whole nature. He had come from them with every sense in his body and every quality of his character braced. Yes, the years were not lost. But, as he reflected bitterly, the love that made life sweet was

lost. And then he paced the deck afresh with a sort of restless fury, as though peace was to creep into the mind through the tired senses of the body.

The *Robert and Mary* sailed without convoy, for she was armed, and the Nile had swept the Mediterranean, as with a besom, of privateers.

'But the narrow waters are infested with French privateers, captain?' Jack suggested.

'Yes, there are plenty of luggers and sloops and such small fry in those waters; but none of them will touch the *Robert and Mary*.' And Captain Harvey ran his eye with pride along his twelve-pounders.

The light on the Lizard was sighted at last, and Jack leaned over the bulwark gazing long at it. That tiny point of light was something more than a signpost for passing ships. How much there was behind it! It stood for England and all that England held and meant; and in Jack's eyes it seemed a starry splendour full of strange and glorious meanings.

The next day they were running along the English coast—headlands and green hills, valleys rich with blossoming orchards, the smoke of towns, clustering villages, the white edge of the foaming sea running along the line of brown sands. It was an English landscape lying under summer skies, and there are not many fairer sights on the planet.

'We shall see the light on Beachy Head before midnight,' said the captain as the sun went down.

But English weather is changeable. As night fell a fog was drifting down the Channel; it blotted out both the stars in the sky and the gleaming lights on the coast. The captain reduced his canvas, set a seaman in the chains with lead and line, and so groped his way slowly through the fog. Jack paced the deck for hours; then, tired of staring into the gray darkness, went to his cabin and turned in.

He was awakened a little after midnight by the roll of the ship on a new course. There was the sound of naked feet on the deck above him, of ropes flung on the deck, of orders given in suppressed tones. Something in the sounds—something furtive and hurried—startled him, and he sat up in his bunk. Presently he caught the sound of a voice giving orders in French. He leaped out of his bunk and commenced to dress hurriedly; but before he had half-dressed the door of his cabin was thrown open and Captain Harvey himself was thrust in and the door closed and locked behind him. The captain's dress was disordered, he was hatless and breathless, and a general aspect of fury was on his red features.

'What is it?' asked Jack in astonishment.

'A d——d French lugger tumbled on to us in the fog,' he said ashamedly, 'and we are a prize.'

'Were your lookouts asleep?'

But to that question the captain could offer no reply except a succession of marine oaths.

'What are they doing with us?'

'They are running, I guess, for the mouth of the Seine, and they will slip across the Channel safely before day breaks unless some British frigate stumbles across us.'

Here was the prospect of a new captivity just at the moment when English shores were in sight, but Jack faced the prospect with an unconcern which puzzled himself. Had liberty ceased to be of value to him, or had he caught from the desert a touch of its fatalism? He would be on French soil, he reflected, within half a dozen hours; and France meant Paris, and Denise was in Paris! His heart kindled at the thought. Yet if Denise were happily wedded it was better, he felt with a pang of unspeakable bitterness, they should not meet.

Captain Harvey proved right. The lugger crept safely back across the Channel through the fog, and as day was breaking brought her prize safely into Honfleur, and dropped anchor in that little port with loud clamour of exultant voices.

'D—— the noisy beggars!' said Captain Harvey heartily, whose notion of discipline was British. 'They couldn't make more to-do if they had captured a line-of-battle ship.'

When the anchor had dropped boats came quickly alongside, and there was a new tumult of feet and voices on the deck. Captain Harvey was ordered up, and went with disgust written on every feature of his red face. An hour later Jack in turn was summoned, and he found himself in the presence of a commissioner in epaulets, who sat at a table under the break of the poop, with the ship's papers spread before him.

'You are *un diplomate*, monsieur?' said the commissioner.

Jack hesitated. 'Well,' he said, 'I was, three years ago, in the service of the British Foreign Office; but for that period I have been in Egypt.'

'That is a circumstance which makes your capture very fortunate for us, and we understand you were actually with the British army. You can give us information as to the state of affairs in Egypt.'

'But I do not know why I should do that,' said Jack coolly. 'There is war betwixt England and France, and any news I could give might have a value beyond what I can guess.'

The commissioner tried all his arts, from persuasion to menace, to wring some information from Jack; but in vain. He was in a stubborn mood. At last the Frenchman announced, with a certain air of menace, 'You will be sent to Paris.'

Jack could easily understand that news from Egypt was keenly desired in France, where the fate of the army was yet unknown, and for that reason he believed he ought to refuse to give it. The crew of the captured transport had, no doubt, talked; but they could only give port-gossip.

In Paris Jack was examined by one official after another, but remained coolly but obstinately silent. 'I will not tell,' he declared, 'what may injure the interests of my own country or serve the interests of the country with which she is at war.'

He was at last told that the First Consul himself had given instructions that the English diplomat

was to be brought before him. Jack was thus to see his old comrade of Brienne once more.

Napoleon had taken up his residence in the Tuileries; and as Jack, in charge of a couple of gendarmes, walked through the echoing corridors of the great building, and waited in the antechamber for his interview with the First Consul, he recalled the scene of August 10, when the Tuileries was stormed by the crowd, its corridors splashed with blood, and the unhappy Swiss slaughtered in its gardens. The unfortunate Louis, when he stepped across the threshold of his palace that day, had left it and his crown for ever; and now the nameless artillery officer who at Jack's side had watched the rush of the crowd on the Tuileries sat as master in the great palace itself, where kings had once dwelt. So strange are the reverses of history!

Presently the door opened, and Jack found himself in the presence of the First Consul. Napoleon stood in front of the great marble fireplace, his hands behind his back, his head bent forward in meditative pose, exactly as he is seen in many well-known paintings. But the long locks and the simple dress of republican days and fashions had gone. Something of royal state was already gathering round the First Consul of France. He was splendidly dressed in a coat with high collar glittering with gold embroidery, he wore silk stockings and shoes, his hair was cut short. His face was fuller than when Jack saw it last, the brown of Egyptian suns had gone from it, it had the contour and the tint of marble. The eyes were keen and masterful as ever, but the look of challenging discontent in them had vanished. Napoleon's genius had found its true field at last, and he was no longer in a mood of furious discontent with an unattained 'destiny.'

As Jack looked at him he remembered this was the man of Marengo and of the Concordat. He had given France glory first, then social order, and it seemed as if he were about to give it peace. There was war still with England, it is true; but the peace of Lunéville was a great relief to France, and seemed to be the prelude of a still wider peace.

Jack stood with these reflections running through his brain, and looking with curious eyes at his old comrade, when Napoleon awoke from his abstracted mood. He lifted his head and glanced at the figure standing at the other side of the table. Then the pupils of his eyes seemed to dilate with surprise. His glance ran with its old swiftness over Jack's face and figure.

'*You!*' he said in a note of wonder, and as if speaking to himself. Then he glanced down at the paper before him. He had not detected in the 'John Lawrence' reported to have been captured in the transport the 'Jean Laurente' of his boyish days.

'You!' he repeated in a louder tone as he looked again at Jack.

'Yes. I owe you no gratitude for my life, for you sent me back to the desert. But I made my escape, and was in sight of England when the French lugger captured us.'

Jack found to his own wonder that the spell of his old comrade over him seemed to be broken. The master of the Tuileries affected him less than the cadet of Brienne with his Corsican patois, or the little artillery officer, shabby in uniform and haggard of features, of later days. He could see him with a certainty of vision, and judge him with a courage of which he had never before been conscious.

He had sat down at a gesture from Napoleon, and laying his hands on the table looked calmly and with steady eyes at the First Consul. There was no halo about him. The fame of great victories, the splendour of a great position, the glamour of supreme genius seemed to Jack irrelevant. Perhaps sorrow had purged his vision. Or had those years in the desert brought him in touch with the ultimate realities of things? Perhaps as he sat there he saw Napoleon against the background of the failure in Egypt, of the scene outside Cairo—the dead body of Kléber carried through the ranks of a mourning army.

'You were obstinate,' Napoleon was saying. 'I gave you a chance at Acre; it was only to carry a message, yet you refused.'

He frowned darkly while he spoke. Jack saw that he was looking in imagination at the gray, shot-pitted walls of the little Syrian town. That was the great arrest of his career, and no later triumphs compensated for it. He had gained the West, but lost what fitted his genius better—the East.

'I refused,' said Jack simply, 'because I would not go on a base errand.'

'Any trick is fair in war. But you were always simple, and you have paid the price,' and he looked half-satirically at Jack. 'How did the Arabs treat you?' he went on.

'How would a group of Bedouins treat a white slave and a Christian?'

'They did not kill you, they did not even harm you,' and Napoleon's eyes ran over the tall figure, the square shoulders, the clear eyes, the strong, grave face on the other side of the table.

'God kept me,' said Jack, looking steadily at Napoleon.

'How did you escape?'

'God delivered me.'

The First Consul shrugged his shoulders, dismissing this explanation with a smile.

'You might have shared my fortunes,' he repeated. 'You flung away a great chance when you twice refused to join me.'

Jack quite understood the contrast these words suggested. He might have walked, a glittering figure, along the corridors of the Tuileries instead of trudging, a slave, under the desert heats, with a tribe of Bedouins. But he shook his head with a smile. 'I made my choice, and I don't regret it.'

Napoleon had the faculty of a great leader for choosing good instruments, and this Englishman, his old comrade at Brienne, had, it was plain, many qualities which would make him useful. He knew French as though he had been born in Paris. Was he not himself half-French indeed? His loyalty

was beyond proof, he was incapable of falsehood, and with a flash of characteristically swift insight Napoleon saw that Jack's experiences in the desert had developed new and fine qualities in him. The long limbs, square head, steadfast eyes, and lines of thought and power in the grave face—here was a human tool of a magnificent sort. He looked at Jack.

'I have a use for you still,' he said significantly.

Jack shook his head quietly, and the half-sad smile that crept to his lips was a more decisive negative than even the shake of his head. With his swift, sure glance Napoleon read the unshakable purpose behind the smile and the gesture, and he changed the subject abruptly.

'What can you tell me,' he asked, 'about affairs in Egypt?'

Jack looked at him. Why, he asked himself, should he not tell? The news had not yet reached France of the surrender of the French at Cairo, nor of the strange terms accepted; but it must come within a few hours. Meanwhile, there was, Jack was conscious, a certain relish in telling the tale of the ignoble close of the great expedition to Egypt to the very author of that strange enterprise. So he told the whole story. He had witnessed a sight without precedent in history—a French army fifteen thousand strong being convoyed by four thousand British and an uncertain body of Turkish irregulars to the seacoast to be ignobly deported to France. Alexandria was being besieged, and would certainly follow the example of Cairo.

'The fleet that carried you to Egypt was destroyed,' he said, looking steadily at the First Consul, 'and not a man of the army you led there will leave Egypt except as a prisoner of war. Your monument in Egypt is found in the sunken wrecks in Aboukir Bay and in a whole army captive or slain.'

Napoleon listened with inscrutable face. Nobody before had ever spoken in such a fashion to him. But if the lines about his mouth grew tense, no gleam of anger shone in his eyes, no colour stole into his impassive countenance. He asked a dozen brief questions as to details; but his genius, it was plain, wasted no regrets on failure. Egypt was a card that had dropped out of the game. Jack, as he looked at him, wondered at the unshakable composure with which a tale of disaster and failure so complete was received.

Napoleon, on his side, gazed with a touch of wonder at the man who could tell him such a story with steady eyes and in speech so calm. And this was his fellow-cadet of Brienne! He recalled the eager, boyish docility of far-off days. What had changed that pliant temper into a nature that had the unyielding hardness of steel? As he studied Jack's face he saw there was something unspoken that saddened the keen blue eyes and made the youthful face grave; some deep underlying trouble that made its subject indifferent to the ordinary ambitions and prizes of life. Escape from slavery, for him, had not been an escape into happiness. Some half-kindly impulse stirred in Napoleon.

'You shall be liberated,' he said abruptly, 'and sent back to England. I could not break faith with your Arab captors outside Acre, but the way is clear here.' And Jack admired his magnanimity and half-regretted his own blunt speech.

CHAPTER XLIII.—AT LAST.

JACK, under a flag of truce, was put aboard a British sloop-of-war keeping watch outside Boulogne, and was landed a day later at Dover. He had time to reflect in the interval whether his good luck was not due to the fact that Napoleon was willing to get out of France as promptly as possible a witness who knew too much. He did not want the disastrous news from Egypt to be made public just then.

A mail-coach from Dover carried him to London, and Jack stepped from it on to the pavement just as dusk was falling. He looked round at the well-known streets with a strange feeling. Here were the prosaic-looking buildings, the stream of ruddy English faces, the crowded traffic. The familiar English speech reached his ears from every side. It seemed as if all the years betwixt, spent under alien skies and in such wild scenes, faded out of his memory. He could have walked to his room in the Foreign Office and sat down at his desk as though the current of his life had never been broken.

He had arranged for his scanty luggage to be sent on to Portman Square, and he walked on through the streets, drinking in the sights and sounds about him through every sense. A hundred times some face which seemed familiar arrested his steps. It was as though his life were readjusting itself to the old conditions of existence by a sort of automatic effort of memory. He walked on till his uncle's house rose before him, and he stopped at the sight. A thousand recollections, bitter and sweet, surged up within him.

It was night by this time. The lights were burning in the house, but the blinds were still undrawn. His hand was stretched out to pull the bell of the door when a woman's figure moved into the full light of the drawing-room. Jack stopped, a thrill ran through his blood. The slender figure, the graceful pose of the head, the rich mass of hair above the oval features were unmistakable. It was Denise! He believed her to be hundreds of miles distant, somewhere in Paris, with the separating Straits stretched betwixt them. But she was here in London! And, as his eyes dwelt upon her, it was the Denise not so much of his memory as of his dreams—the vivid face, the exquisite set of the brow, the poise of the head on the slender neck; Denise under an English roof, and set in the familiar framework of his uncle's house.

As he looked and wondered, shaken with agitation in every nerve, Denise moved into the full light of the lamp, and stood musing with bent head. Her attitude recalled the girlish figure with

hooded face lit by the candle on the stairs in madame's house in Paris of years before. Her figure, though tall and straight, was so maidenly or even girlish that it seemed incredible she could be a wife. The picture was exactly that which love had painted a thousand times over on the canvas of his imagination, a face out of which tenderness and loyalty looked.

A hot, unreasoning wave of feeling swept through him. He pushed open the door, crossed the hall, and entered the drawing-room, shutting the door softly behind him. Denise turned in leisurely fashion, with the meditative look still on her face, thinking it was her aunt who had entered. She lifted her head and stood arrested, an image of unbreathing wonder. The colour had died out of her face, her lips were trembling.

'Jack,' she whispered, as if to herself, and the next moment she was in his arms, with a deep, long sigh—a sigh half-sob—of perfect content.

What he said Jack could not have told. He was kissing passionately, again and again, her rich hair. She lifted her head at last, with flushed cheeks and eyes brimming over with happy tears, and looked at the dark, careworn face of her lover, and as she looked love shone like a flame in them.

But Jack's eyes were not in search of hers. He had spoken her name, but for the rest speech seemed to have forsaken him. He had caught her left hand and lifted it into the light, his eyes searching the slender fingers eagerly for the ring he feared to see there. Her face flushed as she yielded her hand to his grasp.

'How could you think it?' she whispered.

No question had been asked, but Denise knew what the questioning eyes meant. Then Jack stooped and kissed her lips.

'Thank God!' he said.

'Yes, thank God you are back!'

'Oh yes,' said Jack hurriedly; but in a deeper voice and with another meaning he repeated, 'Thank God!' Then his eyes turned afresh on the ringless finger, and Denise's cheek flushed a richer colour as her lover lifted it to his lips and kissed it again and again.

THE END.

A DUFFER'S SALMON.

By F. G. Aflalo.

LEANING over the high parapet of the solid masonry that spans the Tweed at Norham, I looked down one bright October morning on no fewer than eighteen salmon lying cheek by jowl, heads upstream, tails waving lazily, in the swift current that runs beneath the arches. A large, deep pool lies just beneath the bridge, and there were the fish, some of them full twenty pounds, none seemingly less than ten. They were not so safe as they looked, for one of the finest casters in England was putting beautiful flies over them, ringing the changes with Silver Doctor, Fiery Brown, and Popham, large patterns and small, single-hooked and double, but to no purpose. The fish, I said, were less secure than they looked—that is to say, they should have been, if superfine casting goes for anything. But does it always? The fish took no more notice of the flies than the flies of them. These worked like living shrimps over their very noses, but never a salmon stirred. The Expert went on casting till his arms ached. Then we went to lunch. The sun, powerful for an autumn day, shone too brightly on the water; in the afternoon, even if no friendly cloud came to mask its glory, the high Scotch bank would shut out its declining rays.

We were soon back from a hurried meal—who, with a soul for a salmon, can linger at table when eighteen fish lie in a pool not half a mile from the door!—and I made a cast or two with the fly that had been left on the rod, a Fiery Brown, I think it was. The Expert said nothing about my casting, but he thought the more. The work that I put in with a heavy two-handed salmon-rod is original but unorthodox. The fly acquires a marked vagueness of intention. It may alight in a tree, or on the bank, or even on the water. It may go no farther than the back of my own trousers. The evening before, in the early dusk, I all but hooked a large white owl; and just before that a long backward-cast just failed to lift the local rabbit-trapper's terrier off its feet and land it out in mid-stream. The quite unusual evolutions of a fly thrown by myself with such a rod may puzzle the fish, or tantalise, or even enrage them. It is impossible to say what is its effect on those cold brains that look through fishy eyes from the foot of a pool. All I know is that on this occasion, in precisely the spot where the Perfect Caster had tired his arms for half an hour without result, and with very little perceptible difference in the light, though, to be sure, the Scotch half of the bridge was throwing longer shadows downstream, my fourth or fifth cast (if, indeed, so free and easy an offer of counterfeit nourishment can be distinguished by so formal a term) got a prompt response; the reel screamed, the rod bent, and a salmon of probably thirty pounds (as a matter of fact, she proved but thirteen, first impressions of salmon are always generous) went bang downstream and seemed bound for Berwick, a mere sprint of eight miles.

I had barely time to step into the boat—I had hooked the fish from the island under the bridge—and bow my acknowledgments to the now speechless Expert with an 'I-commonly-do-that-sort-of-

thing' air, when the fish changed its course with trying abruptness, rushed back in our direction, and bored in under the north bank, where it apparently sulked in an eddy. Hereabouts I was put ashore, and then followed a depressing ten minutes or so, during which, like antagonists over a chessboard, neither side made a move. I had been for some minutes putting as much pressure as seemed wise on the too retiring partner of my exercise, when some one threw a friendly stone from the bridge. It was well judged. It sent the salmon off like the wind, and I followed at somewhat more dignified pace over the not very difficult Scotch bank, only hampered now and again by the snags of trees that were. The fish continued down past the Lady Cairn, well hooked it seemed, but not yet tiring. Not once did he leap. The spring fish do the leaping; those of autumn fight belowboard. Whirr! goes the reel again; little by little I coax in the line, and at last there is an encouraging gleam, the first sign of weakness, just outside the cairn. Our friend is tiring. So, if the whole truth must be told, am I. Contempt for the backache induced by long frolic with a seventeen-foot salmon-rod is a matter of either habit or lying. I too have read all those wonderful reminiscences of the great salmon-fishermen of yore, who trifled with these two-handed rods much as do our modern degenerates with six-ounce cane rods on the Itchen.

Vixere fortes ante Agamemnona: they lied to some purpose in the good old days! The exhilaration of playing a salmon discounts, it is true, the exhaustion; but had this salmon not thrown up the sponge when it did, I should, had I dared to face my gillie afterwards, have surreptitiously lowered the top of the rod and given it its liberty. Even as it was, a premature dip of the landing-net, which merely tickled its stomach with the ring, goaded our failing friend to a supreme dash for liberty, which would have proved successful had not the double-hook held fast in the bone. At the next silvery evidence of exhaustion the net got home, and the fish, with a tap on the skull from a handy stone, joined those that were.

The Expert had by now joined me on the bank. He blandly supposed that I attributed my success to my casting. Frankly, I did; it was so distinct from anything else ever seen on Tweedside that there must have been that which was irresistible in its concrete expression in the shape of a salmon-fly which in all probability alighted on its head and then revolved about itself like a catherine-wheel. Yet I was exceeding meek and deprecated my success with the unqualified humility that you hear only from a man who has just grassed a good fish or brought off a right-and-left. What cared I, looking down on the quivering prize, for the barbless shafts of the Expert's satire. There was I, and there, too, was my fish, and beside us the good Tweed went singing down to the sea. I was content with life. Dame Juliana Berners hit off my mood to a thought when she wrote: 'And yf the angler take fysshe, surely there is no man merier than he is in his spyrte.' Exactly. I was merry in my 'spyrte,' and the Master's mirth passed me by!

THE THREE-ARMED BUDDHA.

CHAPTER VII.

IT was four days later, and the scene was the drawing-room of Mr Deighton's house at Senlac Gardens. Here were assembled the ex-merchant, his daughter, Sir Frederick, and his nephew. They were awaiting the arrival of Soma Khush, with whom it had been arranged that he should present himself there at three o'clock that afternoon. On a little table within Elsie's reach stood the image of the Buddha.

The clock on the chimneypiece had hardly ceased chiming the hour before the young Hindu was shown into the room. All rose as he entered, and Mr Deighton, going forward, shook hands with him, and welcomed him in fluent Urdu. Then, speaking in English, he added, 'Here is my daughter, whom you know already, and these gentlemen are my very good friends Sir Frederick Wyllan and Mr Frank Denaby.—Gentlemen, Mr Soma Khush.'

The Hindu bowed in Eastern fashion to each of the three, but to Elsie more profoundly than to the others. He was a spare, handsome young man, with a refined cast of features, and eyes such as are rarely seen anywhere but in the East. He looked slightly taken aback, and as if at a loss to conceive for what purpose he had been summoned there. Then he caught sight of the image, and an instantaneous change came over him. A strange glitter came into his eyes, all the warmth faded out of his complexion, leaving it of a peculiar dusky pallor, while his chest began to rise and fall quickly. He seemed hardly conscious that Elsie had advanced and was addressing him.

'The vision seen by you in your trance has fulfilled itself,' she said. 'Here is the image of the three-armed Buddha, and it is I who place it in your hands.' She held out the bronze to him and he took it with hands that plainly trembled. Evidently he was profoundly moved. He touched the image's forehead reverentially with his lips and then replaced it on the table.

'It is as if a miracle has been worked in my behalf,' he said to Elsie. 'Well is it that I had sufficient faith in that which Agob Ram caused me to see—although at the time I was bitterly disappointed that he could show me nothing more—to

induce me to come to England and await whatever might happen. May I ask, Miss Deighton, whether the image is your property?'

'No, it belongs to Sir Frederick Wyllan.'

'Take a chair, Mr Khush, and you shall be told how it happens that you find the image here.' It was Mr Deighton who spoke.

A few minutes sufficed for Soma's enlightenment.

'And are you of opinion,' Mr Deighton finished by saying, 'that the person calling himself Mr Chundra Das is your uncle of that name, and that he and Mr Jellum Ghosh are one and the same person?'

'I think there can be no doubt on either point. My uncle has been in England more than once before.'

'It is evident that, like yourself, your uncle sets a great value on the recovery of the image.'

A bow of acquiescence was the only reply.

'But how comes it to pass that Mr Chundra Das was enabled to trace the whereabouts of the image so exactly?'

'Who can say?' replied Soma, with an outspreading of his palms. 'Perhaps it was revealed to him, only in more precise terms, by a similar agency to the one whose aid was sought by me. On the other hand, as I happen to know, he corresponds with certain of his countrymen here in London, and through them he may have been able to trace the image.'

Mr Deighton leaned back in his chair, as having nothing further to ask.

So far, Soma had dropped no hint as to why both he and his uncle were so desperately bent on obtaining possession of the image. Was it regarded by them as an object of especial reverence because of its peculiar malformation, or was there some other feature in connection with it of which no mention had yet been made, or perhaps would be made?

Addressing himself to Soma, Sir Frederick now said, 'Mr Khush, I hope you will permit me to make you a present of the bronze, which I assure you I have much pleasure in doing. My nephew bought it for me at a sale. To me it is an object of no consequence, but with you the case is evidently very different. Accept it, then, from me as a little gift.' He had risen while speaking, and, taking the image off the table, he handed it to the Hindu, who rose and received it with a profound obeisance.

'Sir, from the bottom of my heart I thank you,' he said, not without a tremor in his voice. 'The recovery of this image of Gautama the Wise, the Enlightened, may mean much to me—or it may mean nothing. That has to be proved. It was the gift of a holy man to my uncle Jamsi Das, when he was at Mandalay, and he valued it very highly. As all here are doubtless aware, the worship of the Buddha no longer prevails throughout the greater part of India, but he is still held in high reverence. This image was missing from my uncle's bungalow a few hours after his death, but nobody thought it worth while to trouble about the robbery, and it was not till nine months later that one Singit Lal, who had been in the Government employ as a writer under my uncle, came to me and acknowledged that he was the thief. Then, at the price of three hundred rupees—he had lost his situation and was without means—he revealed to me a certain secret. But, in turn, the image had been stolen from him, nor could he trace what had become of it. At length, however, it and I have been brought together, as doubtless it was predestined that we should be; for the Powers which rule our fortunes weave their webs in darkness and no man can foretell what the issue will be.'

He ceased, and holding the image in both hands, he regarded it intently, his lips moving the while as though he were asking its forgiveness for that which he was about to do. He had spoken in quietly modulated tones and with no trace of excitement; but his face had not yet recovered its customary warmth of colouring, and his bearing seemed to indicate a tensity of emotion kept forcibly under restraint. 'Now to prove whether Singit Lal lied to me or spoke the truth!' he said aloud.

Thereupon he grasped the head of the image in one hand and its body in the other, and putting forth all his strength he succeeded, after three or four attempts, in unscrewing the upper part from the lower. Then, placing the latter on the table, with the aid of his scarf-pin he extracted a tightly folded paper from the cavity of the image's skull and unfolded the same. A glance at it was enough. With a salaam, he handed it to Mr Deighton. 'Singit Lal did not lie to me,' he said. 'It is my uncle's lost will in which he makes me his heir.' He seemed to glow from head to foot.

After glancing over the will, which was written on very thin paper, Mr Deighton handed it back. 'I congratulate you very sincerely on your good fortune,' he said. 'I see that the will is drawn up in English.'

'Yes, sir, and it is witnessed by two of my uncle's English friends. He was proud of his position under the Government.'

'What is your estimate of the value of the property he died worth?'

'Between nine and ten thousand pounds. My uncle Chundra Das claimed the whole as being due to him.'

'Then, what steps do you purpose taking in order to compel him to refund it?'

'In the first place, I have this will. In the second, Singit Lal—who is very clever with his pen—has confessed that it was he who forged my late uncle's signatures to the acknowledgments for money purporting to have been lent him.'

'You think Mr Chundra Das will not venture to challenge such evidence?'

'I am convinced that he will not.'

Soma Khush stayed to dinner that evening at Senlac Gardens, and was made much of. Two days later he was on his way back to India, taking

with him his uncle's will and the image of the three-armed Buddha. News from him was received a few months later by Elsie, who by that time had become Mrs Denaby. Rather than risk the consequences of going to law, Mr Chundra Das had preferred to disgorge the amount in full of which he had so nefariously despoiled his nephew.

It had been a matter of wonder to Elsie why her father had chosen to rent such a big mansion as Winterslade Park; but the secret came out before long. Mrs Lennox and he had agreed to join hands and to venture on the matrimonial sea together.

Denaby did not forget Rupini's widow, who had claimed her husband's body at the mortuary. All funeral expenses were defrayed by him through an agent, and the widow shipped home to Naples with twenty pounds in her pocket.

THE END.

OLD PROVIDENCE.

THE Caribbean Sea, which washes the coast of what the historian calls the Spanish Main, has been often described by the novelist, who here has pictured sea-fights in which the sturdy followers of Drake and Grenville overcame the galleons of Spain, with their cargoes of treasure. Since those stirring times, however, so many years have elapsed that the one who sails this beautiful sheet of water would not believe its peace had ever been disturbed by the cannon-shot or the cry of battle, for to-day it is one of the quiet parts of the world. While an occasional sail may be seen or the smoke of a steamer, one might cruise for days upon the Caribbean without seeing a single craft, and in the waters which once formed a thoroughfare for the fleets bearing the wealth of New Spain to the mother-country.

So far out of the track of the tourist is the Caribbean that many of the islands it contains are almost unknown to the white man, especially the few which lie off what is known as the Mosquito Coast of Central America. One of these presents a curious sight to those who see it apparently rising out of the waters. At first one can discern but two black points jutting above the horizon. As the ship approaches nearer they begin to resemble huge jaws of rock which, to say the least, look uncanny. After the entire shore-line has revealed itself the shape of the jaws is still clearly visible, as they rise so high above the other formation.

The jaws indicate to the mariner the location of a bit of an island which is many miles away from other land, so isolated from the rest of the world that it seems out of it. Old Providence, as the map-maker calls it, is in truth a dot on the waters. Not over four miles from end to end in its longest direction, and half as much in width, a good walker can encircle it by the little coast-path the natives call a highway in half a day. The human beings who call it home are confined to its outer edge, for the submarine volcano, which at some time in the past ages gave birth to Old Providence in one of its convulsions, topped it off with a miniature mountain range stretching above the centre of the island. It is one of these mountains that forms the black, gaping jaws so plainly seen long before the graceful cocoa-nut-palms marking the shore-line are visible. In a whimsical display of its power, the volcano cut a great wedge in one of the peaks—a wedge fully one hundred feet across at the top and tapering to a score or so at the bottom.

To-day, as centuries ago, Old Providence is a tiny country to itself. Far out of the modern ocean-highway, in one of the least frequented parts of the Caribbean, the steamship or sailing ship has no occasion to pass near it unless driven there by storm. There is no post-office, for the reason that there is no mail service. True, it is claimed by some country, just as every point that sticks out of the sea is claimed. Colombia calls Old Providence a part of its republic; but not a man lives upon it to act as governor, judge, or even agent. So its people kill, steal, and commit other crimes utterly regardless of any authority save force and the little influence of the solitary white man who has cast his lot among them.

St Catherine's, as it was mockingly called in the old days, was the stronghold of Henry Morgan. For nearly two hundred and fifty years the blood of his followers has flowed in the veins of its people; but before the freebooters sailed into its harbour the Spanish Governor of Costa Rica had made it an island-prison for criminals he thought too dangerous to keep on the mainland. When Morgan defeated the garrison, he placed as guards over his captives a hundred of these convicts, released on their promise to join his band—literally human dregs of New Spain. Again the Spaniards captured the island and turned it into a penal colony, until Morgan's flag was raised above it in 1670, and the struggle for its possession ended. Since then most of those who have lived upon it have been descendants of the white outlaws, their convict allies, and the black women who went there from the West Indies on Morgan's ship.

To-day fully a thousand persons live upon this islet—a thousand human beings who have degenerated in mind until the majority of them are little better than beasts. Murder is common, theft is not a crime, marriage is unknown. Only the fear of a stronger keeps many a man from taking life for a trifle. The women are a prolific cause for crime. If one is more attractive than some of the rest, in

the desire to possess her it is a common occurrence for the rivals to fight until only one remains alive, and it is the law of the island that she goes with the survivor until he tires of her or she leaves him for some one more favoured.

Yet nature has here made a place which is very beautiful. So fertile is the soil and so mild is the climate that the part of the island not covered by the little mountain range contains groves and gardens which produce in abundance the fruits and vegetables of the tropics, such as yams, cocoa-nuts, bananas, even cotton which can be made into clothing. So it is that the people can satisfy their needs with little labour. The cocoa-nut-trees yield such a harvest that occasionally a vessel stops at Old Providence to get a cargo. Most of the cocoa-nuts are traded for clothing, liquor, firearms, knives, and trinkets. After a vessel has loaded and departed, for days the island may be the scene of a drunken debauch which brings to mind stories written about the carousals of the buccaneers after the capture of a prize; but here is no captain or discipline of the sea. The weaker are the prey of the stronger, and robbery and killing pass unnoticed. It is the testimony of Father Saint John, the brave priest who alone is endeavouring to do something to improve the condition of these people, that scarcely a week passes without a murder.

With only a handful out of the thousand population acknowledging any form of Christianity, it is not strange that the belief in fetiches, even voodooism, should be widespread. Witch-doctors and sellers of charms for good and evil are numerous. Most of the women wear next to the skin a tuft of hair, a piece of rag smeared with blood, or some other amulet—which is intended to cast a spell over their enemies or to keep off Satan—in which all believe.

But the life and history of these human renegades is not the only evidence to prove that their home is a real pirate-island and not the sort of which the novelists are so fond of describing. At its north end rises a rocky plateau covering half a dozen acres. Really it is another island, but separated from Old Providence by a channel a hundred yards in width and so shallow that one can easily wade across it. The highest point of this plateau bears a slight resemblance to a man's face, and the native says that it is 'Morgan's Head.' The fifty-feet precipice which extends from the water's edge to the top of the plateau is so steep as to be almost inaccessible except in two or three places where the storms of years have worn away the stone. The top is so covered with vines, shrubs, and other growth that not until one has penetrated into their midst does he find the remains of a wall, evidently the work of human hands. Most of it is hidden by the rank vegetation; but enough of the massive masonry can be seen to indicate that it was intended for a fortification, with its openings through which to sight the cannon and its narrow slits for the musketeers. A strange sight are the dozen or more pieces of artillery mounted upon a plateau at the north end. Some of them are of brass (but long since thickly coated with verdigris, which gives them the appearance of fallen trees green with mould), others are of iron; but all of them still bear traces of artistic imagery with which the gunmakers of the seventeenth century decorated their work. Lying inside of the wall, the guns were evidently a part of the armament of Santa Theresa, the castle which the Spaniards built for the main defence of St Catherine's, but which they surrendered to Morgan in 1670, with eight smaller forts and batteries.

Of all the strongholds which the Spanish conquerors in America erected to defend their possessions, those upon Old Providence and the tiny islet by its side were among the most elaborate, and this dot on the ocean has a history which is rivalled by few places in the world. For over a century it was the scene of attacks made not only by vessels flying the flag of Britain, but by the buccaneers, then by the Spaniards in their attempt to wrest it from the victors. So far away from other land, it is not strange that when Spain's power in the New World was broken and peace declared the humanity on Old Providence should have been practically forgotten by the rest of the world, and its people left to themselves. For centuries they have thus lived until what nature made an earthly paradise is inhabited by beings who are among the most degraded of the human race.

THE MONTH: SCIENCE AND ARTS.

BACTERIOLOGICAL EXPERIMENTS WITH POWDERED MILK.

A MONTH or two ago we published an article describing the process of manufacturing dried powdered milk, as evolved by Dr Martin Ekenberg, the dominant feature of which was the evaporation of the water under vacuum at a low temperature. In order to determine the degree of sterilisation effected by this treatment, a series of elaborate bacteriological experiments have been carried out by Dr Klein, the sum of which shows that although the fresh milk might be heavily contaminated by the most virulent germs, the drying operation brought about their destruction so completely that subsequent search for bacteria showed negative results. Tests were carried out with both fresh and redissolved milk, the dry product in the latter case being recombined with the prescribed quantity of sterile distilled water. Analysis was made for the detec-

tion of the bacilli belonging to the diphtheroid and coli-typhoid groups respectively, for the propagation of which milk is an ideal field; but a thorough examination failed to detect traces of any microbes. Possibly the most supreme test was that in which five hundred cubic centimètres of fresh milk, after preservation in a refrigerator for twenty-four hours, were mixed and shaken up with five cubic centimètres of human tubercular sputum which was crowded with the tubercle bacilli. This highly infected milk was then dried according to the Ekenberg process and subsequently used for the infection of guinea-pigs. The animals when killed upon the twenty-first day after the milk-powder had been subcutaneously injected were found quite free from infection. A third animal, however, which had been infected with a small trace of the sputum was found to have tuberculosis definitely developed. From the result of this searching investigation redissolved milk-powder should constitute an excellent dietetic for people suffering from tuberculosis, since it can be easily made as required in any desired quantity. To quote Dr Klein in his report, it 'offers every guarantee of security against undesirable infection, such as may occur in the consumption of raw milk to which the contagium of bacillus typhosus, diphtherial or tuberculosis, may have had access.'

HENS *v.* INCUBATORS.

One of the most complex problems that presents itself to those engaged in the chicken-rearing industry is the heavy mortality that prevails among young chicks, the cause of which is of a most baffling nature. Such losses are particularly heavy among those hatched artificially. In order to determine the reason of such decimation the Ontario Department of Agriculture has for some years been carrying out continual experiments, the latest results of which have been incorporated in a recent bulletin. This report is well worth perusal by all those engaged in the industry, for it treats the mystery from all standpoints and has a well-drawn-up detailed tabular result of the observations. The investigations were carried out with various types of incubators in comparison with natural hatching, and the conditions prevailing with the latter in regard to temperature, degree of humidity, and other chemical and physical phenomena were carefully observed. Some very curious and interesting facts were secured. For instance, those chicks hatched from hens setting on moist earth were found to thrive the best. Pedigree and weight records were preserved, as well as the data concerning over four hundred and fifty post-mortems carried out during a period of six months. Experiments were also carried out to ascertain if any better results were secured by commencing hatching in an incubator and completing under the hen, and *vice versâ*. Concerning artificial hatching, it was found that washing the machines with a solution of zenoleum improved the vitality and produced good, thrifty birds, with a corresponding decrease in the mortality. It was found, however, that various types of machines differed in their efficiency, and it would seem that the perfect incubator is still far from being attained, since what treatment suited one type was unsatisfactory when applied to another. At the same time, however, the experiments have served to bring out the distinctive features of individual machines, and valuable information is extended which may profitably be followed in order to secure the maximum proportion of chicks from eggs.

WATERPROOF PAINT FOR STONEWORK.

The preservation of stone and brick work from the corrosive effects of moisture, especially in those districts where such buildings are exposed to salt-water spray, as upon a sea-front, though in urgent request has hitherto proved difficult of achievement. Several so-called waterproof specifics have been devised, but they have only proved of temporary serviceability. It would seem, however, that a greater measure of success has been attained by the preparation 'lithoderm' (stone-skin), which is the invention of Mr J. Wilson Dougal, B.Sc. (Edin.), a well-known analytical chemist. It is a secret preparation, in the form of a transparent solution, which upon application penetrates and clothes the surface of masonry with an impermeable film, upon which dampness, frost, physical, chemical, fungoid, and bacterial influences fail to exercise any deleterious effects. The specific has been submitted to a prolonged series of exacting tests which have served to substantiate its claims, and there are many buildings in Scotland which, treated with this solution several years ago, still retain their pristine appearance and strength. That the ancients evidently possessed some efficacious means of preserving their structures from decay is evident from the excellent condition in which they are to be found when excavated to-day, and in order to impart a similar durability to modern erections the application of some such preservative agent is highly essential. Even the most porous masonry when treated with this medium offers a completely resistant surface to the destructive action of the organic and inorganic impurities in the atmosphere. It is eminently suitable for preventing the obliteration of inscriptions and maintaining the natural colour of the stone or brick work. It requires no special means of application, being used just the same as paint with a brush, and, moreover, is economical in use, a gallon providing sufficient solution for one coat over sixty or seventy square yards.

OPEN-AIR SCHOOLS.

Recently a movement has been initiated in this country for the establishment of outdoor schools where weak and unhealthy children can prosecute their scholastic training in the open air with the self-same facilities as obtain in an indoor establishment. The beneficial effects of such a development upon

backward children, who from the very deficiency in their physical condition are unable to maintain the same rate of progressive improvement as those of more healthy build, is apparent. In Germany this scheme has been carried to a high standard of perfection. Such children are broadly divided into two classes—those merely backward, their elementary education having been sadly neglected, and the physically debilitated—that is, suffering from such maladies as anæmia, rickets, insufficient and inefficient nourishment, and who by the inevitable irregular attendance at school gradually fall behind the standard of their stronger class-mates. Upon such children the lack of fresh air has a decided retarding effect, as experience has shown, since directly they are removed to more stimulating environment their weakened systems rapidly recuperate, enabling them to prosecute their studies more regularly and profitably both to themselves and their teachers. It is merely a question of adapting educational organisation to mental and physical capacity. Quality and not quantity of the curriculum is resolved into a vital factor, and instead of a bewildering cramming with which they are unable to cope, they are subjected to a special course of training. The schools are situated in the most invigorating surroundings, preferably a pine-forest, the children are medically inspected, carefully nourished and tended, and encouraged to avail themselves of the hygienic organisation provided for their especial benefit. Instruction reduced to the most necessary subjects is graduated in its period from about two hours per day upwards, according to the receptive capacity of the child, though teaching is never maintained for more than two consecutive hours. The scholars are allowed to pass the intervals as they individually desire, though after dinner two hours' complete rest and sleep are insisted upon. Under these conditions the weakened vitality of the children is rapidly built up, and the greater majority are found in a short time to have improved sufficiently both physically and mentally as to enable them to be returned to the elementary schools and take their proper places in the classes, while those who cannot pass the examining ordeal are sent to institutions for the mentally deficient. By this means not only is the proportion of ignorant children reduced to the minimum, but the classes are always maintained at a high level of proficiency. The schools are maintained throughout the year, the open-air training being suspended only during the bitterly cold weather and when the ground is covered with snow. When the weather is wet the educational work is maintained under cover, the buildings closely resembling those adopted at institutions for the treatment of consumption.

NEW AUTOMATIC LIGHTER FOR STREET GAS LIGHTING.

A simple and inexpensive device of ingenious design has recently been perfected for the lighting and extinguishing of street gas-lamps. Some years ago the inventor evolved a system of this kind which proved highly successful, with the sole exception that it was affected by damp, a defect which after some two years' ceaseless experiments he has now completely overcome. Unlike the greater majority of such appliances, it is not electrically or pneumatically operated, but consists of a small by-pass tube screwed on to existing fittings and containing a small piece of secret composition unaffected by damp or heat, which immediately the gas comes into contact with it becomes incandescent and thus automatically ignites the gas at the burner. Consequently any number of jets can be lighted or extinguished from a central point merely by turning on and off the gas main supply. The device costs but a few pence, and is so strongly made that it will last for years without any attention. The inventor has also devised a modified form of the appliance for household purposes, dispensing entirely with matches, a point which will be greatly appreciated. Not only does it facilitate the use of gas, but where incandescent mantles are employed gives the latter a longer life, since lighting is carried out without any accompanying vibration or concussion of the mantle.

AUTOMATIC DISINFECTANT FOR FLUSH-CISTERNS.

Although sanitary science has resulted in the evolution of excellent arrangements for preserving hygienic conditions with flushing-cisterns and water-traps which prevent return waves of noxious and injurious fumes, there is always the lurking danger of sewer-gas. While odourless, it is of a deadly character, and, being easily soluble in water, it readily contaminates the atmosphere after it has thoroughly saturated the water. To counteract this highly dangerous contingency, a unique device has recently been contrived which absolutely preserves one against infection from the above cause. There is a small cylindrical vessel fixed into the flushing-cistern by a hook, and which is always in an immersed position when the cistern is charged with water. It is filled with a powerful germicide in a concentrated form. The disinfectant chamber is isolated from the surrounding water by means of a valve at the lower end of a tube extending through the former and perforated with holes. When the cistern commences to refill, the rising water enters the lower end of this tube, discharging the displaced air through the open upper end. When the water within the tube has reached a sufficient height it becomes locked therein by a small valve and dissolves a small quantity of the concentrated disinfectant. When the cistern is again emptied, directly the level of the water falls below the bottom of the cylindrical vessel the pressure of the air through the upper length of the tube forces the small quantity of dissolved disinfectant through its lower extremity, so that it combines with the water passing out of the cistern. The water-trap thus contains a charge of the germicidal agent, and as the sewer-gas rises it is seized by the disinfectant and oxidised,

so that it is rendered perfectly innocuous. The sterilising action is plainly visible in the water, since in the struggle the disinfectant loses its original pink colour. The disinfectant itself is quite odourless. It will be seen that the appliance works automatically, and, although it is only three inches in diameter by two inches deep, it contains sufficient disinfectant to treat at least two thousand gallons—that is, will last about six months in the average household—and costing merely a few pence, it is brought within reach of all who appreciate the necessity of completely nullifying the baneful dangers of the deadly sewer-gas.

WAX FROM SUGAR-CANE.

A discovery which will no doubt prove of far-reaching importance to the sugar industry has recently been effected which will result in what is practically a waste product being turned to distinct commercial advantage. This is the perfection of a process for extracting wax from the cane which is present in the rind or bark. It is stated that one ton of cane will yield about fourteen ounces of wax similar in its nature to beeswax or carnauba wax, and which tests have shown to be applicable to any of the purposes for which the latter is at present used. Considering the present high price of wax, the discovery is of some importance, especially as it is merely recovered from what has hitherto been considered as refuse.

A HARVESTING RECORD.

A correspondent in South Australia sends us details of an interesting world's record in harvesting, when two hundred and two bags of wheat were cut, thrashed, and bagged, ready for market, in one day, upon a South Australian farm by means of a single Sunshine Harvester. American agricultural machine manufacturers have always claimed to be pre-eminent in the designing of time and labour saving appliances for this range of industry, and although they have accomplished remarkable work in this direction, the credit of having devised the finest machine of this type must be awarded to an inventor in the Antipodes. This machine not only reaps, winnows, and bags the wheat, but also sews the filled bags up and deposits them in convenient heaps upon the ground ready for collection and transportation to market. For operation upon the huge wheat-fields such as one meets in Australasia, Canada, and the United States, this harvester is stated to be unequalled, and judging from the above record it fully justifies all that is claimed for it.

A HYGIENIC VERMIN-DESTROYER.

There are certain members of the vermin category which, despite the most vigilant efforts of the householder to preserve cleanliness, persist in effecting an entrance into the building, and then prove difficult of removal. Among these the cockroach or steam fly and the black-beetle are the most familiar. Hotels and restaurants are probably the greatest sufferers from this pest. There are numerous specifics on the market which claim to eradicate these insects, but their success is only partial, borax being a prominent constituent of the so-called secret compound. Certainly they cause a complete disappearance of the vermin for a time, but it is only a retirement to the seclusion of their homes, where they follow their cannibalistic tendencies until the traces of the borax have disappeared. Then they again rapidly multiply and make a fresh sally from their hiding-places, so that the last stage is worse than the first. The most efficacious exterminator for these 'wee beasties' that has yet been prepared has recently been subjected to some severe tests. It is in the form of a paste, and the ingredients evidently appeal to the insects' palate, for they devour it with avidity. They afterwards retire to their haunts, when the mixture commences its deadly work. The insect is first killed and then the chemical action of the ingredients of the paste sets up a violent corrosive action which completely consumes every trace of the body. Consequently there are no noisome odours created. So rapid is the compound in its action that a whole establishment may be completely cleared in a single night, no matter how heavily it may be infested. Hotels which have thus been rid of the nuisance have not been revisited by the pests.

CEMENT FROM WASTE PRODUCTS.

A striking instance of the important bearing of applied science to industry has recently been furnished at the factory of one of our largest soap-manufacturers. In preparing the latter commodity an immense quantity of various residues accumulate. Some of these can be turned to commercial advantage, such as glycerine, but others have hitherto resisted any profitable application. Among the latter is carbonate of lime, which is produced in large quantities. In the course of prolonged experiments in the chemical laboratory, searching for some means of utilising this waste, the above manufacturers succeeded in discovering that it could be profitably employed in the making of Portland cement, and the process being commercially applicable, a large factory as an adjunct to the soap-refineries is being erected capable of turning out over four hundred tons of cement per week.

SMOKE ABATEMENT IN GERMANY.

The port of Hamburg has a flourishing society, the scope of which is the devising of ways and means to mitigate the smoke nuisance, and in which direction it may be pointed out it has proved eminently successful. The work of such an institution has a dual advantage. Not only does it protect the ordinary member of the public, but it also enables the manufacturer to secure a greater degree of efficiency from his fuel, with an attendant economy in consumption. The society tests various devices for overcoming smoky chimneys, instructs

stokers in the art of firing, suggests expedients for reducing smoke emission, and periodically tests and overhauls the plant. As a general rule it is found that the evil is remedied by the addition of an automatic appliance for controlling the admission of air. Mechanical stoking is recommended as much as possible, but owing to the fact that unscreened British coal is extensively employed in Hamburg hand-firing is more generally adopted. Various fuels are tested by the society with the idea of securing those which have a high thermal value with the minimum of smoke creation. Stokers are also stimulated to reduce the smoke emission from the furnaces under their control by the preferment of a bonus, representing a certain percentage on the saving effected in fuel costs by the proper regulation of the air-draught and other means for securing more perfect combustion. The society is performing highly useful work, and a similar institution in this country pursuing an identical enterprising policy would attain far more practical results than attends mere participation in academic debates.

MOTORS AND DUST—IMPROVED HIGHWAYS.

Our main highways have become much less pleasant and safe for pedestrian and cyclist since the advent of the motor-car. Not only are there intermittent, choking dust-storms, but the surface of the roads rapidly deteriorates. Heavy motor traffic is even worse for destroying the road's surface than the ordinary motor-car. District road boards and county councils complain of the additional expense and of the dust; sometimes experiments are made with tar macadam; the dusty, choked pedestrian writes to the newspapers to relieve his feelings, and there the matter usually ends. The treatment of a roadway with calcium carbide at Inveresk, Midlothian, a hundredweight to 100 gallons of water, mixed, and sprinkled on the road, is said to be successful in dust-laying. In New Jersey, where the roads are being rapidly worn out, and where improved roads are being laid, a light binder of clay and gravel is added to the second coating of stone, and to this asphaltum oil is applied. The oil works in between the gravel and the stone, and the usual top-dressing is then applied and the road rolled. It is found that the oil attaches itself to the top-dressing firmly. This kind of road is found harder, and dust has no such chance to accumulate as on the old-fashioned road. It is believed that this method of treatment may reduce the cost of maintenance by half, and be a boon to all who use or live near the road. Certainly the roads in Great Britain need new methods of road-making also, to cope with the increase of motor traffic.

A NEW PUNCTURE-CURE.

'Allustite' (always tight), a new self-sealing puncture-cure and rubber preserver, has just been placed on the market. It is a chemical composition, yellow-brown in colour, and though of a thick consistency has a peculiar property of flowing very readily. It is the invention of a young Edinburgh cyclist, Mr William Ross, one of the hardiest riders in the Lothians. Put up in collapsible tubes, it is injected into the inner tube through the valve-stem, and circulates inside the tire as the wheel runs, neither slowing it nor interfering with its resiliency. One tube contains enough to treat a new inner tube; for porous tubes it is advisable to use one and a half to each. The inventor only claims that it will seal small punctures such as are made by pins, tacks, or thorns; but in experimenting with it he proved that in a best quality outer cover, with a tandem inner tube, it could seal holes up to a three-inch wire-nail. Before being offered to the public it was tested last winter and during the spring by over twenty cyclists on all sorts and conditions of roads with unvarying success. When a hole is made in the tire the air pressure within forces the 'allustite' through the aperture, where it quickly dries and seals it up. Once thoroughly hard, it can only be removed with boiling water or scraping with some hard, blunt instrument, such as the back of a pocket-knife. It does not interfere in the least with patching larger holes: as, while fluid, it is easily washed off with cold water, and repairing proceeded with as usual. It is also guaranteed not to remove old patches and is sufficiently fluid not to clog the valve, the rubber tube of which it keeps soft, making inflating easy.

A SEPTEMBER EVENING AT A FARM IN THE HIGHLANDS.

The summer sun is dropping in the west,
The loch is steel-blue, gray, and keen and cold;
The lambs are bleating weirdly for the fold,
The chickens anxious seek their mother-breast.
Within the wood the wind a cumbrous lay
Moans as the twilight creeps into the night,
The sounds and dronings of the passing day
Fade into silence with the waning light.
The moon, like blushing maiden, pale and shy,
Hideth in cloud of drapery in the sky,
Day after day and dark sequestered night
Follow each other in their frequent flight
Till summer passes, leaving, as before,
Hopes unfulfilled and mysteries as of yore.

WALTER SMITH.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

CASIMIR LE SOMBRE.

By Lady ROLLESTON.

CHAPTER I.

MY name is Gabrielle Mayer, but I am known in Poland as 'Casimir le Sombre.' I was born in a remote Alsatian village, where my father, who was an officer of the Imperial Army, had retired, after the fall of Bonaparte, to spend the remainder of his days in peace and quietude among his native hills. My mother died when I was quite a child, and for some time my health was so weakly that my life was despaired of. A kind aunt named Antoinette devoted herself to fan the wavering flame of my young existence, and nursed me with a tenderness and care that even a mother could hardly have exceeded; but I grew no stronger.

My father, as I have said, was a soldier, and he was a veteran of that old cast-iron stamp which marked the men who won the first Napoleon his great victories—a class that has almost disappeared now. He was not a hard-hearted man, but he had a hard manner, and looked with great disfavour on what he considered my aunt's undue coddling of his weakly child. As time wore on and still I grew no better, his impatience burst out more and more frequently; and one day—I think it was when I had attained my fifth year—he could contain it no longer, and swore roundly that my good aunt was bringing me up to be a confirmed invalid for life, and that he would take me in hand and train me after his own fashion to make a fine healthy lass of me; adding, if that might not be, he would rather I should die young than live without health.

My poor aunt was aghast at this stern decree, and shed many bitter tears from the fullness of her kind heart; but there was no gainsaying my father when once he had made up his mind on any subject, and from that day he laid down new rules for my life, and made me his constant companion.

I now had to be up every morning before sunrise, and in my bed by sundown, to bathe daily in cold water, and to spend long hours rambling over hill and dale at my father's side, wearing the same dress winter and summer. I always went about in boy's clothes, and he taught me to swim, ride, shoot, run, and fence, till I was thoroughly efficient in all these exercises. Besides this, he made me intimately acquainted with every part of a soldier's drill, and often took me out to watch the troops of the neighbouring cantonment at their manœuvres, so that I acquired a great taste for military life, and in my girl's heart thought that there was no career like that of a soldier.

Strangely enough, this rough schooling did not kill me; on the contrary, it had a beneficial effect, and I, who had been before so weakly, became the most active and healthy girl in the commune. I saw, however, very few girls of my own age, and cared little to seek their company, feeling, as I suppose boys must feel, a joyous exultation in my strength and skill in all manly exercises, which made their companionship, at that time, seem dull and tame to me. They on their side, I fear, thought me very hard-hearted, for one day I remember little Eulalie the schoolmaster's daughter, a gentle, fair-haired child of nine, burst into tears at the sight of a brace of fine rabbits I had shot in the woods, and asked me with as near an approach to indignation as she could summon into the expression of her soft gray eyes, how could I be so wicked and *méchante* as to kill such pretty creatures? But it never struck me then that it might be cruel to kill the wild beasts and birds of the forest, though I have thought since that perhaps the habit I acquired of looking unmoved at their death may have rendered me less liable to emotion during the terrible scenes it was afterwards my lot to witness.

I know, however, that I was not really hard-hearted, for I would not have hurt a butterfly, or a beetle, or any living thing that was not what is called a legitimate object of the chase, for the world; and I have often gone almost supperless to my little

 [*All Rights Reserved.*]

bed in the attic that my dog Scaramouche might have a better meal.

In this way I had nearly reached my twelfth year when a great change came over my life—my father decided to send me to a convent.

For some time past the curé, the Juge de Paix, and other people of local influence, had expostulated with the stern old man on the way he was bringing me up. They pointed out to him that I was a very big girl for my age, and that I could not always continue to go about in boy's clothes; indeed, the curé said it was contrary to the ordinances of the Church, and they urged, with some reason, that however beneficial his training might have proved to my physical health, in mental culture I was little more advanced than a young Ojibbeway or any other savage; and that, as after all I had *not* been born a boy—a circumstance the old soldier always heartily deplored—it was his duty to fit me in some way for the life that was before me.

It was not without a sore struggle that my poor father bowed to this advice, but the word *duty* with him was paramount; and he would flinch from no sacrifice, even though it were of his most cherished hobby, when once he was made to understand that it was his duty to obey.

'*Monsieur le Curé*,' he said, in his brief, military way, 'all my life I have done my duty to the Emperor; he is now no more, peace be to his ashes!' and he gravely lifted the old straw Panamá hat that he wore summer and winter. 'But you tell me I have a duty towards God,' here he saluted again, 'that I must perform, and in this I take it you are my superior officer, and'—after a long pinch of snuff—'I will obey.' Wherewith the old gentleman turned on his heels and shut himself up in his room for the rest of the afternoon.

Oh, the change when the great doors of the convent closed upon me! I felt as if the world and the sunshine were shut with them, and I had bidden adieu—it seemed to me for ever—to my free, joyous existence among the hills and woods of our native valley, where every lark that sung in the blue sky, every violet that nestled in the cool shadow of the oak copses, every tree, and stone, and brook, and clump of moss, was a friend that I loved to see and greet as I rambled abroad in the sweet, dewy air of the early morning. Even poor old Scaramouche my dog was denied me, my boy's clothes were taken away. I was dressed in the whitest of muslin caps and the demurest of gray frocks and pinafores, like the other *pensionaires;* while I was told that for four long, long years the bare whitewashed corridors of the convent were to be my home. It was not that I did not receive very kind treatment, or was without pleasant companions; but how could they sympathise with me? What did they know of the wild exultation of the chase, the thrill of delight that tingled through every vein as the report of my little gun, which my father had cut short on purpose for me, was followed by the heavy thud of the great red-legged partridge falling on the dun fallows, the momentary twinge of remorse when I saw its eyes close in death, and then the keen excitement with which, emboldened by success, I started in pursuit of fresh game? As I have said, I was little better than a young savage, and I thought the first morning in the schoolroom would have killed me.

Yet, strange to say, I made great progress in my studies. I had led far too active a life to remain idle long, and it chafed me to think that all these weak schoolgirls around me, who would hardly know a snipe from a woodcock—if they saw one—were so much cleverer than I. Besides, perhaps because my mind had never been overtaxed in early youth, I had not learned to acquire a distaste for study, and I soon began to devote myself to it with an avidity that astonished the good nuns, who had been accustomed all their monotonous lives to drive the three R's into the reluctant and struggling minds of the country children in a purely mechanical manner—a course of instruction which, like physic, however much it might be for their ultimate good, was received by their pupils with considerable repugnance.

It was something new to them to find a child whose unsated mind was eagerly craving for more knowledge, and in the next four years I rapidly made up for lost time, though not even the discipline of the convent could quite divest me of the free and boyish bearing I had acquired in my previous wild life, and which often brought forth a reproving frown from the grave superior.

CHAPTER II.

I WAS nearing my seventeenth birthday when my poor father died suddenly, leaving me his blessing and a small competency. His loss was my first great grief, and I felt it very, *very* keenly; for, though latterly I had seen him but rarely, I remembered him always as my best friend and loved companion in the dear old bygone days, and I alone knew the deep tenderness and affection that underlay the hard exterior of his manner.

Now I was almost without a friend, for I had no other relative, good Aunt 'Toinette' having died while I was still small; and though the Sisters offered to take me back to the convent, and even threw out hints about the propriety of a young girl in my isolated position becoming the bride of the Church and endowing the Convent of Our Lady of Tears with my small fortune, I felt that I could not return to them.

It was about this time that I made the acquaintance of a young Polish lady, who took a great fancy to me, and offered me a home with herself and her husband in Poland. The liking between us was mutual; so, after some delay and legal formalities, it was at last agreed that I should accompany her there.

Countess Deotima Czartoryska—for such was her title—lived in an old castle in Russian Poland which had belonged to her husband's family for centuries, and was surrounded by a magnificent forest, tenanted by wolves, bears, and all sorts of game. We were far removed from any city, and the Count had often to be from home, on business he said, looking after his estate; so that the Countess and I were not infrequently left alone for weeks together in the great house, and became close friends and companions.

The life in my new home suited me exactly, my old love of the chase revived; and the Count, who was kindness itself, gave me a splendid black horse from the Ukraine, which I named Zampa, and on which I scoured the country round for miles, till I knew every glade and dingle of the solemn pine-forests by heart, and could have pricked my way through them on the darkest night.

You have no idea how beautiful the Polish forests are when the young leaves are beginning to shoot, and the whole air is fragrant with the fresh, sweet scent of the pines.

The ground is carpeted with the softest moss, from which the lofty trees rise straight and majestic, the dark leaves of the previous year throwing out in bold relief the green-and-gold of the spring shoots; here and there you find vast tracts of woodland where the silver birch grows lovingly beside the sterner pine, contrasting gracefully in its delicate drooping beauty with the masculine grandeur of those giant trees; a hundred varieties of fairy lichen cling like lace to the massive trunks, the air is full of the music of bees and insects, while the birds call to each other with sweet, plaintive notes well in harmony with the sad story of the country.

But it is in winter that you feel the true solemnity of the pine-forests. Then no sound strikes the ear save the weird rustle of the branches stirred by the breeze, for it is a frozen region, where the ripple of running water is never heard, and the foot falls noiselessly as the step of a spirit on the great white carpet spread beneath. High overhead, the dark boughs of the pines stretch like the dusky canopy of night, only that their upper surfaces are decked with delicate snow-crystals which shine starlike through the gloomy vault, so dense in places that it almost obscures the light of day.

But hark, the silence is broken! A low wailing sound is stealing through the trees resembling the angry murmur of the surf along a rockbound coast, the snow showers down in glittering spray till the heights of the forest become enveloped in a seething, eddying mist, the stalwart stems of the pines creak and groan like the masts of a vessel as she bends to the hurricane; suddenly the small patches of sky above grow dark as night, there is a crashing among the boughs as if a thousand stags were clashing their antlers in battle, the lightning flashes, for a moment illuminating the gloomy scene, and the great trees bow like reeds before the force of the sudden storm. But not for long; again they rear their giant heads proudly and shake their dark branches on high, tossing them wildly in their wrath, till they are lashed into a fury that can only be compared to the raging of the waves of the ocean.

Again the storm is past, a pale, flickering ray of sunlight struggles through the gloom; only the sighing of the trees, panting as it were after their recent conflict, tells of the past fury of the tempest; the bells of a sledge tinkle merrily in the distance, growing louder as it sweeps rapidly over the glittering snow, its occupants wrapped to the eyes in furs. Now the horses gallop up to the massive wooden porch of the château, and half a dozen hands are stretched hospitably out in welcome, though the visitors may be utter strangers to its inmates; they are travellers in Poland, and for that night, and for as long as they chose to remain, they are *at home*.

In the long wainscoted reception-room into which they are ushered a goodly fire of gigantic pine-logs is burning and crackling brightly on the hearth, the great brass tea-urn is singing merrily on the table, its soothing tones inviting the weary to refreshment, costly rugs and furs cover the floor and couches, books, musical instruments—all that lends a charm and refinement to domestic life—may be found collected in this comfortable retreat, where the storms of winter, be they ever so severe, never enter, and the host and hostess strive with the most polished courtesy to make their guests forget the fatigue of the journey. One thing only strikes the eye as strange: the ladies of the house are all in sombre black, not in one house alone, but in all you enter. The women of Poland are in mourning for the misfortunes of their country.

These, and a hundred similar scenes, gave a romantic charm to my life in Poland that I shall never forget. I soon began to love the people with whom I had made my home, and to feel for them and their wrongs as sincerely as if I had been born amongst them.

(To be continued.)

MEMORIES OF THE GREAT TERROR.

'I FEAR that people generally do not realise that invasion is perfectly possible, and that unless we have a sufficient and efficient army for home defence we shall find the enemy some day overrunning the country.' So wrote Lord Roberts recently to a correspondent. The contingency hinted at is what daily and hourly dwellers in Great Britain lived in the fear and dread of at the beginning of last century. So much was this the case that the period has been named that of the 'Great Terror,' when Napoleon was making brisk preparations at Boulogne for the invasion of England. The story has been told again in all its lights and shades, and with vigour and interest, in two handsome volumes, *Napoleon and the Invasion of England: the Story of the Great Terror*, by H. F. B. Wheeler and A. M. Broadley (John Lane). The great feature of the volumes is the series of illustrations from contemporary prints and caricatures, some in colour, with material gathered from newspapers, diaries, letters, and broadsides. They are a monument of industry and a landmark in the history of the subject. The work has never before been so thoroughly done. Amongst the new materials are unpublished letters of George III. and gleanings from Dumouriez's unpublished Memoirs on the defence of Great Britain and Ireland.

We are suffering yet, like the rest of Europe, from the ambitions of Napoleon, who was mainly responsible for the death of about six millions of human beings, while millions sterling were added to the National Debt of the United Kingdom. The Emperor made history, and changed the life of kingdoms; but all he accomplished would have fallen into the shade beside the conquest of Britain. Captain Mahan has said, 'Those far-distant, storm-beaten ships upon which the Grand Army never looked stood between it and the dominion of the world.' In spite of all that has been said and written of *entente cordiale*, the revival of the Channel Tunnel project called forth feelings and opinions which showed that the fear of invasion still lurked in the national mind.

The menaces of Napoleon caused our volunteer movement to spring into life from a sense of overmastering danger. Of the seventy-four martello towers erected around our coasts many are still standing. They cost about seven thousand pounds each, are circular in form, and stand like inverted flower-pots. In these two-story buildings the lower was for a powder-magazine and storehouse. The flat roofs were bomb-proof, surrounded by a breast-work four feet high, and were mounted by a swivel gun and two howitzers. Of the two martello towers at Felixstowe, one has been converted into a shelter for cattle and is private property, the other is an Admiralty Marconi station.

The French programme of conquest reads strangely to-day, and savours of the pirates of the Western Main. The French army was to march to London after landing, humble the capital of the haughty English people, plunder the National Bank of its immense heaps of gold, seize upon all public and private property, and return laden with spoils. Different people were differently affected. As a result of the invasion scare of 1803, Eastbourne was almost deserted during August, owing to a rumour that the French contemplated landing in the neighbourhood. Barracks were constructed on the beach capable of containing ten thousand men; there were barracks also at Pevensey Bay, and the crops were to be destroyed should a landing be made. As our authors say so pertinently, 'Napoleon's projects are constantly mentioned in the journals of women like Fanny Burney (then Madame D'Arblay, the wife of one of the French *émigrés*), Mary Berry, Hannah More, Hester Lynch, Mrs Piozzi, and others. Bishops at their visitations, judges on the bench, politicians in both Houses of Parliament, preachers in their pulpits, dramatic authors in their plays, poets in their verses, actors on the stage, Freemasons in their lodges, magistrates at their county meetings, merchants on 'Change, shopkeepers at their counters, labourers at their ploughs, all held the same language as to the common danger.' There were countless pamphlets, songs, broadsides, and caricatures published between 1796 and 1802. Of three thousand two hundred caricatures, three hundred refer to invasion. Pye added a suitable verse to the national anthem. Burns wrote:

> Does haughty Gaul invasion threat?
> Then let the loons beware, sir,
> There 's wooden walls upon the seas,
> And volunteers on shore, sir.

The poet was one of them, dressed in a blue coat, with the undress nankeen pantaloons of the volunteers; and his hat, because of the shortness of his neck, turned up behind. His last hours were harassed by a pressing application for the settlement of a debt of seven pounds four shillings due for his volunteer uniform. On his deathbed he said to a friend, 'John, don't let the awkward squad fire over me.' In spite of this, the Dumfries Volunteers fired three volleys over his grave.

Lord Grenville wrote from Dropmore to a friend: 'You will find me here very peaceably rolling my walks and watering my rhododendrons without any thought of the new possessor to whom Bonaparte may dispose of them.'

The war-fever can be easily traced in the literature of the period, as in Wordsworth's sonnet when at Calais in 1802:

> With many a fear
> For my dear country, many heartfelt sighs,
> Among men who do not love her, linger here.

Coleridge had written 'Fears in Solitude' in 1798,

Richard Cumberland a 'Volunteer Song' and a 'Rifle Corps Song.' Scott wrote from Scotland in 1803 to his friend Ellis that the necessity of the present occasion had kept almost every individual, however insignificant, to his post. 'God has left us,' he wrote, 'entirely to our own means of defence, for we have not above one regiment of the line in all our ancient kingdom. In the meanwhile we are doing the best we can to prepare ourselves for a contest which perhaps is not far distant. A beacon-light communicating with that of Edinburgh Castle is just erecting in front of our quiet cottage [at Lasswade, six miles south from the capital]. My field equipage is ready, and I want nothing but a pipe and a moustache to convert me into a capital hussar.' Scott's promptitude at the False Alarm of 1805 along the Borders is well known. Lockhart tells us he was at Gilsland in Cumberland when the alarm reached him, and that his horse carried him a hundred miles to the rendezvous on the other side of the Border in twenty-four hours. Scott was delighted with the general enthusiasm and the rapidity with which the yeomen of Ettrick Forest had poured down from the glens.

Visitors to Rome may see on the right side of the Barberini Palace an inscription recording the victorious campaign of Claudius in Britain. Boulogne —the scene of Napoleon's activity—known then as Gesoriacum and afterwards as Bononia, was a regular harbour for passengers to Britain under the Empire. Cæsar sailed from some portion of Picardy, either Boulogne or Wissant, reached the chalk cliffs of Dover, and may have landed at Deal. Tacitus says he only struck the natives with terror, but made himself master of the seashore. 'The discoverer, not the conqueror of the island, he did no more than show it to posterity.' Caligula's threatened invasion of Britain was but idle parade, as from the shore near Boulogne he ordered his soldiers to gather sea-shells as trophies to be deposited in the Capitol. Agricola, after 78 A.D., was the first Roman General who effectually subdued the island, and the only one who displayed as much genius and success in training the inhabitants to the amenities of civilisation as in breaking their rude force in war. And it has been remarked that no fort founded by Agricola was ever stormed by hostile violence and surrendered by its fugitive garrison. After the Roman legions were withdrawn at the beginning of the fourth century, the Anglo-Saxon conquests followed, those of the Danes in the early eighth century onwards, and the landing of William the Norman at Pevensey. Queen Elizabeth condensed the fate of the Spanish Armada of 1588 into a sentence for a medal, 'God blew, and they were scattered.' The fusing of Saxon, Dane, and Northmen has helped to make us what we are as a race that has gone forth and inherited more of the earth than any nation since the domination of Imperial Rome.

Our authors tell us that 'from the entangled threads of the Revolution was woven, not the sovereignty of the people, but the despotism of one man.' That one man said that 'if, instead of the expedition to Egypt, he had undertaken that to Ireland, what could England have done?' There was an abortive expedition to Ireland and the threatened invasion of Wales by Hoche's Black Legion under Colonel Tate at Fishguard, now the starting-point of turbine steamers of the Great Western Railway between Pembrokeshire and Wexford. Britain struck at a vulnerable point in the East. Nelson destroyed the greater part of the French fleet in Aboukir Bay, and it may have been true, as said by Napoleon, 'If it had not been for you English I should have been Emperor of the East; but wherever there is water to float a ship we are sure to find you in our way.'

There is an oft-quoted remark of Lord Acton's that the most dangerous situation in which Britain was ever placed was in 1803, when Fulton, the American engineer and inventor, proposed to put the French army across in steamboats. He believed that if Napoleon had secured Fulton's proposed steam-power to take the flotilla to England, as he proposed, 'during calm weather when the British sailing-vessels would be powerless,' the history of the world would have been changed. Napoleon rejected the scheme. In any case, with steam in its infancy, Fulton's steamboat was far too slight a craft, in its experimental stage, for this duty; when tried on the Seine, the engine broke through the hull and sank the boat. The inventor caught a cold then which he never entirely shook off. The original autograph document in Fulton's hand, addressed to Napoleon, is still extant, in which he also proposed a scheme whereby British ports could be blockaded, and their shipping destroyed by means of 'plunging boats and carcasses,' the names he applied to submarine vessels and torpedoes. Rejected by France, he turned up in London under the assumed name of Francis, and placed before the British Ministry plans for the use of submarine torpedoes and 'plunging boats' against the French. According to the agreement made by Pitt and Lord Melville with Fulton, the inventor was to receive forty thousand pounds. The scheme, so far as tried, was not particularly successful, and it is believed Fulton's remuneration was not more than fifteen thousand pounds.

Napoleon was enthusiastic over the rupture with England in the spring of 1803, and decided to 'leap the ditch.' Some thousands of boats had been ordered to be built. 'The arsenals of France vomited fire and smoke day and night; almost every port rang with the blows of the shipwright's hammer, and ammunition was turned out in thousands of tons. . . . The greatest Land-Power sought to encroach upon the domains of the mightiest Sea-Power of all time, and to wrench from her grasp the sceptre of Father Neptune.' What Napoleon had said of Citizen Fulton's proposal—that it might change the face of the world—was quite true, but it was to be of no use to him. Leading French officers

in the navy considered that flat-bottomed boats propelled by oars, sails, or both, were best suited for crossing the Channel. On the other side, Pitt hoped to make the option between burning the ships before they set out, sinking them either on their passage or before their troops could land, destroying them as soon as they were landed, or starving and taking them prisoners afterwards. Nelson said, 'Whatever plans may be adopted, the moment the enemy touch our coast, be it where it may, they are to be attacked by every man afloat and ashore. Never fear the event.'

The worst crises in the 'Terror' period were in 1797–98 and 1803–5, and for ten years at least the United Kingdom was an enormous camp. By 1805 there were six hundred thousand armed men for internal defence alone, troops, militia, and volunteers. Not until 1814, when Napoleon was sent to Elba, were the volunteers disbanded. Nelson chafed at the delay in coming to blows, and said, 'We shall never have a solid peace until the invasion is tried and found to fail.' He almost wished for a universal war that should 'upset that vagabond Bonaparte.' Instead of crossing the Channel, Napoleon's armies crossed the Rhine and the Danube. 'Soldiers,' said the Emperor in one of his bulletins, 'but for the army which is now in front of you, we should this day have been in London; we should have avenged ourselves for six centuries of insults, and restored the freedom of the seas.' After Trafalgar had been fought and won, 21st October 1805, 'the cloud of invasion had rolled away, and the Great Terror was over.'

Napoleon flattered himself that the English people would have welcomed him. A glance at the caricatures in these two handsome volumes tells a different story. By many in England he was regarded as a fiend in human shape. The ship in which young Thackeray came from India to England touched at St Helena. A servant pointed out Napoleon to him: 'That's he, that Bonaparte. He eats three sheep a day and all the children he can lay hands on.'

Of a different order is a volume on *Napoleon's Men and Methods* by a Norwegian author, Alexander L. Kielland, translated by Joseph M'Cabe (London: Owen & Co.). There is an introductory essay by Mr Oscar Browning which runs counter to much in the volume, as well as to the received opinions regarding Napoleon. It is an interesting and readable book, with no pretence to originality. Kielland thus writes of Ligny and Waterloo: 'It is very striking to see how often in these two battles, Ligny and Waterloo, everything hung on a single thread. If Ney had made haste he might have caught Wellington at the ball at Brussels. If D'Erlon had not made a false move the Prussians would have been surrounded at Ligny. Blücher might have been made prisoner if any one had recognised him; and Napoleon might have won the battle of Waterloo if Grouchy had done his duty. All this means, of course, that the whole apparatus which had once worked so accurately and flawlessly, as well as the chief himself, were somewhat worn. His Generals had lost their blind faith in his invincibility in Russia. It was now plain that this belief was the real cause of his invincibility.' It is astonishing how lacking in insight many of the books and journals regarding Napoleon have been. Long ago Bishop Thirlwall came to a conclusion regarding Napoleon diametrically opposed to much in this volume, and before the literature on the subject was half so voluminous. The Bishop wrote that Napoleon 'viewed and treated men, whether in or out of uniform, as a chess-player his pieces and pawns. . . . His ambition was not only the cause of "faults," but was itself the worst of all, being not only insatiably greedy, reckless, and remorseless, but essentially low and vulgar; and this while he had the true glory of Wellington before his eyes. . . . No Hercules ever more deliberately chose the path of evil.'

And as Wheeler and Broadley point out, 'From his column in Trafalgar Square a Man of Bronze stands looking across the Channel in the direction of the memorial erected to another Man on the heights of Boulogne—a perpetual warning to those who would dare to invade this fair land, and assuredly an inspiration to the inheritors of a glorious past.'

THE PAST—AND ISMÈRIE.

By Arthur H. Henderson.

IN TWO PARTS.—PART I.

APART from the actual crew and the two passengers, the story is confined to the senior director of the Republican Bank of South America, in New York, the owners of the *Bulwana*, and the chairman of Lloyds. The recital of the truth explains various things hitherto a mystery.

Every underwriter at Lloyds remembers the *Bulwana* being overdue on a voyage from the Plate to New York with a consignment of half a million in specie when the premium jumped to sixty guineas per cent., and something akin to consternation pervaded insurance circles. Members will tell of the cheer of relief in the long-room in the Royal Exchange in London when her arrival was rung in on the great bell, and the flimsy yellow telegrams announcing her safety were pinned on the notice-board. 'Delayed by breakdown of engines, bows and deck damaged,' ran the message. There it

stopped; no particulars came out, and, strangely enough, no subsequent claim was ever made by the shipowners in respect of the accident. Claims for casualties involve publicity of details.

Sundry other minor events were chronicled about the same time. There was, however, no suspicion of connecting-links between them.

At Lord Railton's unexpected marriage in New York the feminine journals which dwelt in detail on the inmost secrets of the trousseau recorded incidentally that the bride carried her left arm in a sling. No explanation of this was given.

Again, rumours drifted to Europe of a scandal in the Argentine war administration, which however filtered down into the mysterious disappearance of a new seventy-five millimètre Krupp gun and some ammunition. These were unaccountably missing from a barge between the German steamer which had brought them from Essen to Fort Pedro, in which the gun was to have been mounted. Yet Krupps are difficult things to steal.

Lastly—and this indeed excited animated speculation—the distinguished Brazilian aeronaut Señor Uzué, with an American companion, totally vanished after a most successful ascent in his new steerable airship. This was a wonder of scientific construction; and the daring of its inventor was as renowned in public as—in the strictest privacy—his moral reputation was sinister. The voyagers had last been seen by a *gaucho* near the coast some ten miles north of Cape San Roque, low down among the sandhills. From that moment not the faintest trace of them had ever been found, despite diligent search. It was reluctantly concluded that the aerial craft had been blown out to sea and the occupants of the car had been drowned.

And this is the story.

If you cross the magnificent Plaza de Mayo at Buenos Ayres, where the statues front the red piled Government buildings overlooking the river, you come to a long palm-bordered drive which leads to a suburb of nestling private residences. The peach-trees extend in graceful avenues along the canal-bank, and the tall cypresses rise in the background above the gardens surrounding the flat-topped dwellings. The buildings are mostly on one plan. An entrance-gate, often a wonder in carved wood, opens on to a tessellated courtyard running round the central *patio* or square, shaded by huge tropical plants and gorgeous flowers. The colouring creepers mask the entrances from the courtyard to the rooms, and conceal the arbours hidden with cunning in nooks against the walls.

In one such corner, in the stillness of a moonlight evening, a girl was standing. She was small, and the eyes that refused to meet those of the man before her were large and blue, with long, fair lashes that matched the tint of gold in her wavy hair. The lacing on the dainty dress between her breasts heaved stormily. The outline of her curving chin and slim young throat gleamed white against the darkened wood behind.

'Ismèrie'—her companion's tone was eager and imploring—'you know I love you. Why do you send me away—alone?'

The girl moved restlessly. Then she turned and faced him almost as if she were afraid of him.

'Think,' she said with a great effort at self-control; 'try to think quite calmly. I'm—I'm just a sort of dependant here in a Brazilian family of no importance; and you—why, you are Lord Railton. Don't you see it can never be?'

'Why?' he demanded with vehemence.

'The past!' she breathed. 'In after years, in your rank and station, in your English home, the past would rise beside us to trouble and—to jar.'

His rejoinder came with earnest promptness. 'When two people learn to love each other truly there is no past except to link them closer. All that matters to the one is the happiness of the other's life,' he urged. She did not stir. 'I think you care for me a little—and—you know I love you.'

'Yes, I know.'

The emotion in her voice, in every delicate feature of her small face, pleaded for mercy. Of her own love she had no doubt, its existence stood in no more need of proof than did that of the trees around. She was bidding him leave her, but with a heart that ached with deadening pain. She leant back against the arbour entrance, white as stone.

'Listen,' he whispered, and his voice was a caress. 'I have booked a passage in the *Bulwana* to New York. In two days she sails. We can be married at the Consulate, and be in England in a month.'

She laid a hand upon his arm. For a moment something within him leapt and sang. But she shook her head very gently.

'Tell me,' she asked in an attempt to divert his attention and stifle her own feeling, 'this steamer—the *Bulwana*—is it she who is to carry the gold?'

He nodded. A sudden financial panic had arisen in New York, and the American banks were clamouring world-wide for coin. There was an imperative demand for prompt despatch of specie, and the next boat was to take the whole amount collectable from the Argentine. The *Bulwana* was a fine cargo-steamer, and was to be employed for the purpose, as no regular liner was available.

The noise of a closing door clanged loudly. The two were in deep shadow themselves; but the moonlight fell on the pathway from the entrance, and they could see a man's burly form enter the house.

'Uzué!' The Englishman muttered heartfelt condemnation of the intruder. 'I thought he was at Rio preparing for another ascent.'

The girl caught the look of intense distrust which shot across Railton's face at the sight of the aeronaut.

'You must go at once,' she insisted quickly.

'When shall I see you again?' he demanded low.

It was on the tip of her tongue to answer 'Never!' but her lips refused to frame the words. Instead, she turned to him with a sudden impulse. 'Don't sail in the *Bulwana*.'

He gazed at her astonished. 'Whyever not?'

She had no tangible reason ready. Her suspicions were the barest merely. 'It may not be safe,' she faltered. Her anxiety was naïve. He was utterly in the dark as to her meaning. There was a short silence. Then Ismèrie spoke with odd directness. 'I will see you once again at least,' she promised. 'Now, good-bye.'

As his light footfall died away, a rush of consciousness returned to the girl to warn her of all the emptiness which life would mean without him. He had told her that his presence was needed in New York at once, and when a woman loves a man she feels that she must positively know everything that he is doing as soon as he is out of her sight. Yet—and she gave her head a resolute shake—go he must, and she must stay behind; stay to resume the old dreary drudgery which had lightened so wonderfully in the short weeks since Señor Uzué had brought Lord Railton home. He had swiftly fallen in love with the delicate little foreign face and soft air of refinement of Ismèrie Marland. She blushed a dusky red in the darkness at the remembrance.

She moved through the gloom of the garden towards the ray of light which gleamed from the open window. Next moment she shrank back into the conccalment of the shrubbery underneath.

The night was thick and heavy, after a sultry day, and the conversation of the inmates of the room drifted audibly outside. Neither of them dreamed of the listener who crouched so closely with her hand pressed to her heart as if to still the sound of its excited beating. In a minute her eyes grew accustomed to the scene.

She recognised the man talking to Uzué; he was an American who often accompanied the aeronaut in his expeditions. She loathed him. She feared his cunning, restless gaze. She detested his mask-like face, colourless like one of the dead, on which no pity or remorse for crime could ever show. He was speaking in a quiet, measured voice.

'I calculate it means a real big lump of dollars. But we must have the boat delayed a shake or two, so as to get back ourselves to Rio first.'

'Manuel will see to that,' chuckled Uzué reassuringly. 'Half that cap'n's crew is run away already. His new Argentines will be—how you call it—a handful—oh yes!'

The American smoked for a while in silence, lost in thought. As he pondered his brow clouded.

'Yon blamed airship of yours can give points to a Chicago sky-sign for prominence with the public in this state.' He shifted uneasily in his seat.

His hearer's hands expostulated eloquently. 'What matter, my friend? We will be suspected the less. It is the chance which has come to us, by the grand luck, as you say.'

The other mumbled what passed for assent. He reached for a drink thirstily, and after a refreshing interlude leant forward and poured out his words in a low, intense tone.

'My bombs are *all* right. Fair nasty scatterin' things, automatic in effect, and burstin' on no instalment plan nohow. 'Tis a proved proposition how they'll lump the fellers on deck to their funerals mighty quick without injurin' the main structure, so as the ship won't sink afore we want it. See?' The speaker's face beamed again with evil fatuous complacency.

But every accent of the conference was caught by the girl's straining ears.

Uzué cut in sharply. 'Tis a fool custom to prepare for the best only! The launch will run out from Bahia and stand-by off Rocas. Take courage, my friend! Soon we will be rich—so rich—with good gold. You agree with my plan?'

Outside, the girl could scarcely breathe till the answer came with curtness:

'You bet, I'm on.'

Ismèrie's eyes glowed slowly with a light those men might have paused to see. Then she slipped cautiously away through the darkness of the garden, a fair young figure with little, noiseless stockinged feet. She understood the menace, she gauged the coming danger. All that silent night the problem confronted her: what was she to do?

In the chart-house of the *Bulwana*, Captain Iredale was so angry that he arose from the locker and fairly trotted round the confined space. Lord Railton sat and watched him.

'The cook is missing now,' stormed the skipper, who was a fat man and fond of his food. He added particulars of what would befall the offender if he returned.

'Ship another,' suggested Railton composedly. The advice was taken ill.

'I've done it. Manuel the ship-chandler has got me a Portuguee saucepan-scraper. But you'd think we were a plague-ship by the way the crew are bolting,' snorted the skipper, spinning round upon him with wrathful heat. 'Never had such trouble. Well, I'm'—— What he intended to declare as his condition mercifully remained unspoken.

On the threshold stood Ismèrie Marland. She looked daintier, more bewitching than ever, with her grave air of innocence, and a curious perplexity of pride and embarrassment on her face. As Railton sprang towards her she threw back the cloak from her shoulders and turned to him impetuously.

'When do you sail?' she queried with abruptness.

'To-morrow, miss,' said the skipper gruffly.

'Have you got your crew?' She panted slightly as she spoke. She was moved by a resolve, true and clear, to ignore the conventionalities, which mean so much to a woman. But then—she loved.

The captain eyed her keenly. 'Most of 'em—new ones from Manuel's,' he told her.

'Ah!' the significance in her voice was unmistakable. 'Is there a cannon on board?' she asked.

The captain stared astounded. 'The *Bulwana* don't carry guns,' he retorted with masculine scorn at feminine intelligence. But this proceeded to vanish as the girl finished the disjointed little sentences of her tale. Both men listened attentively.

'It's not to be believed,' said Iredale, breaking the pause that followed. 'No one would dare.' But his tone was uneasy and doubtful.

Railton rather agreed. However, the girl was disconcertingly confident. His eyes never left her face.

'Well, what are you going to do?' queried the captain with deliberation.

'I am coming with you,' Railton decided quietly.

'And you, miss?'

The girl was still tingling with the daring which had steeled her to board the *Bulwana* alone. Besides, how could she return to Uzué's household again! With a frank fearlessness came her answer, 'I think I will also—if I may.'

(To be continued.)

A VISIT TO EPHESUS.

By Captain F. W. von Herbert.

'A certain man named Demetrius, a silversmith, which made silver shrines of Diana, brought no little business unto the craftsmen; whom he gathered together . . . and said, Sirs, ye know that by this business we have our wealth. And ye see and hear, that not alone at Ephesus, but almost throughout all Asia, this Paul hath persuaded and turned away much people, saying that they be no gods, which are made with hands: and not only is there danger that this our trade come into disrepute; but also that the temple of the great goddess Diana be made of no account, and that she should even be deposed from her magnificence, whom all Asia and the world worshippeth. And when they heard this, they were filled with wrath, and cried out, saying, Great is Diana of the Ephesians. And the city was filled with the confusion: and they rushed with one accord into the theatre, having seized . . . Paul's companions in travel. And when Paul was minded to enter in unto the people, the disciples suffered him not. And certain also of . . . his friends . . . besought him not to adventure himself into the theatre. Some therefore cried one thing, and some another: for the assembly was in confusion; and the more part knew not wherefore they were come together. And they brought Alexander out of the multitude, the Jews putting him forward. And Alexander beckoned with the hand, and would have made a defence unto the people. But when they perceived that he was a Jew, all with one voice about the space of two hours cried out, Great is Diana of the Ephesians. And when the townclerk had quieted the multitude, he saith, Ye men of Ephesus, what man is there who knoweth not how that the city of the Ephesians is temple-keeper of the great Diana, and of the image which fell down from Zeus? Seeing then that these things cannot be gainsaid, ye ought to be quiet, and to do nothing rash. For ye have brought hither these men, which are neither robbers of temples nor blasphemers of our goddess. If therefore Demetrius and the craftsmen . . . have a matter against any man, the courts are open . . . let them accuse one another . . . it shall be settled in the regular assembly. For indeed we are in danger to be accused concerning this day's riot, there being no cause for it: and . . . we shall not be able to give account of this concourse. And when he had thus spoken, he dismissed the assembly.'—This is Acts, xix. 24–41, Revised Version. A few unessentials have been omitted.

EXCAVATIONS have laid almost the whole inner city of Ephesus bare, and the traveller can follow step by step the scene of the stirring events related by St Luke. British, Germans, and Austrians have at different times worked towards this end; but the chief credit is due to the Austrians, who are even now engaged in extensive and methodical excavation.

Two preliminary observations—one as to the size of ancient Ephesus, the other as to its situation—are necessary if such readers as care to accompany me on a leisurely ramble desire an intelligent comprehension of what they shall see.

Towns were smaller nineteen hundred years ago than they are now. Many a settlement dignified by the name of city in the ancient records would be but a hamlet nowadays. A town of twenty thousand inhabitants was a city of the first magnitude. Some modern writers ascribe this size to Ephesus; but we have the indisputable fact that the theatre—which, thanks to the Austrians, has been preserved intact—holds twenty-four thousand five hundred persons. Moreover, the fringe of suburbs has hardly been touched yet. I have myself discovered traces of an extensive residential settlement three miles from the town, a kind of Ephesian Richmond or Hampstead. Turks and Greeks grow vines, figs, oranges, olives, tobacco where whole streets of villas lie hidden beneath the roots. I am inclined to put the size of Ephesus, including the suburbs, at one hundred and sixty thousand souls, a veritable London for those days. It was also a thriving seaport. Moles, landing-stages, harbour-works have been brought to light. But the sediment of eighteen centuries has prolonged by ten miles the river Caystrus, on the mouth of which Ephesus was situated; and between the old landing-stage for passenger vessels and the sea there is to-day a ten-mile stretch of fertile, marshy, fever-haunted, mosquito and snake infested plain, through which the modern Caystrus flows lazily in its narrow and devious channel.

Unlike most of the ancient towns of Asia Minor, Ephesus has a well-defined recorded history. The town, one thousand and forty years before Christ's birth, was founded by Ionian Greeks, who landed at the mouth of the Caystrus and deemed the site suitable for a colony. It came to an end A.D. 1116, when the Seljuks conquered and destroyed it. Thus for over two thousand years Ephesus was one of the most important towns of the then known world, first as the headquarters of the Diana cult, then as the seat of Christian apostles and bishops. It was one of St John's Seven Churches (probably the most important) and a flourishing commercial emporium; its soldiers were renowned for valour,

its craftsmen for skill. Considering the age of London as roughly one thousand years, of Berlin or St Petersburg as five hundred years, of New York as three hundred years, it must be conceded that Ephesus lived to a hoary old age. But a settlement near the site of Ephesus is much older. The Phœnicians founded a colony four miles higher up on the Caystrus several centuries before the advent of the Ionians; and when they did so they found there already a village of the Carians, the original inhabitants of Asia Minor. It is impossible to define the age of the latter—three thousand years before Christ is not an overestimate. When the Seljuks had destroyed biblical Ephesus they built a new town on the ancient Caro-Phœnician site. For two centuries the Seljuk city grew and flourished; but the Seljuk Empire fell to pieces, the Crusaders came and went, the Turks conquered, were beaten, and conquered again, and to-day the dirty Turkish village of Ayasoluk, of five hundred inhabitants, marks the site of the Caro-Phœnician settlement, and is the only living remnant of a glorious history of several thousand years. It is a strange coincidence that on the spot where the Carians began, perhaps fifty centuries ago, the Turks are ingloriously vegetating in our days.

At Ayasoluk, then, we too must begin our wanderings, for we have come from Smyrna, and Ayasoluk is a station on the Smyrna-Aidin railway. There is one other approach to Ephesus—from the little harbour of Scalanuova, on the modern Caystrus mouth, twelve miles westward. But Scalanuova has no regular communication with the outside world; none but Greek and Turkish coasting vessels touch it, though as a place for the clandestine exportation of antiquities (prohibited by the Turkish Government) it is the darling of European excavators and museum agents. Not for long hence, however, for the harbour is being filled in by the all-conquering Caystrus sediment.

Nothing is to be seen in Ayasoluk itself of past grandeur except some thirty pillars of the ancient aqueduct which supplied Ephesus with drinking-water. The village consists of a dismal station, an inn glorified by the name of Grand Hotel, half a dozen rustic Turkish cafés, and a hundred or so of small Turkish and Greek homesteads, poverty-stricken and sordid. But something is to be seen below the surface. There is scarcely a householder in Ayasoluk but has a secret store of antiquities, either dug up—sometimes accidentally, sometimes systematically—or stolen from the excavations.

The steep, bare hill above the village is crowned by a grim and massive castle, a reminder of Seljuk dominion. Very fascinating is the exploration of this gaunt and forbidding remnant of Asiatic barbarism, but we have better things to do.

Immediately outside the village, between it and Ephesus, are the remains of the Seljuk city, consisting of one magnificent mosque, well preserved and a splendid specimen of the Islamic architecture of the period, and perhaps twenty little round dome-crowned buildings which greatly puzzle the uninitiated. They are not in rows or other order, but are irregularly dispersed over the plain. These are the hammams so dear to the Moslem heart—hot-air baths, or Turkish baths, as we call them. Some of them serve as sleeping-places to shepherds, vagrants, brigands. My Smyrniote friend once took refuge in one during a thunderstorm, and came out covered with millions of fleas. He had to burn his clothing. Nevertheless, I ventured into one particularly well preserved; even some of the coloured glass windows in the dome were *in situ*. This one is the private property of a Greek vine-grower of Ayasoluk, who lent me the key. Inside, I found a long stone box, apparently an old Ephesus sarcophagus, with a modern wooden cover. In lifting the latter I discovered human skulls and bones. The Asia Minor Greeks dig their dead out of the ground two or three years after interment, wash the bones, and preserve them in convenient receptacles in places that are not easily accessible.

For twenty minutes we walk along a narrow path through cultivated ground—the fluffy tufts of cotton on one side, young American vines (impervious to phylloxera) on the other—ground so fertile that it will yield abundant crops of almost any produce of any country or climate practically without care. Now and then the end of a fallen column or the corner of a polished marble slab sticking out of the soil reminds us that we are treading classical ground. Apparently we have left life behind us in Ayasoluk, for not a living being is to be seen except a milk-goat and a donkey, who are wending their way homeward unattended, leisurely and as good comrades. It is a glorious autumn day, the sky is of a dark-blue unknown to England, and from the west, from the tideless sea twelve miles away, comes a health-giving breeze.

Almost without warning we arrive at the brink of what appears to be a large quadrangular pool, the size of a London Square. It is partly filled with stagnant water, the remains of last week's rain-storms, and out of the glassy, sky-reflecting surface are protruding pedestals, fallen pillars, bits of statuary, hewn stones, in a disorderly tangle. Snakes are lying on sun-exposed polished marble surfaces, and a pariah dog is quenching his thirst, crouching on a magnificent Dorian capital. Gaze your fill, for you are standing before one of the seven wonders of the old world—the temple of Diana of Ephesus. 'Great is Diana of the Ephesians' cried the multitude, and here is all that remains of the marvel which incited them to frenzy and rage when they thought that unholy innovators had attacked the fair fame of her whom Asia and all the world worshipped. The discovery of the temple ruins is the work of an Englishman, Mr Wood, of the British Museum.

But we must hurry on, for the Smyrna-Aidin railway's last up-train leaves at four o'clock, and we have no mind to try the hospitality of the Grand Hotel, except for a hasty meal before departure.

A two-mile walk along the winding goat-track, between patches of cultivation, rich meadows, and thickets of brambles will bring us to the theatre, the centre of the ancient town. Half-dug-up remains everywhere, on both sides of the path, among blackberry tangles and wild-olive groves, on the big hill to our left, called Mount Prion, along the slopes of which to the flat top extended the old city in the Caystrus plain on our right. This was apparently the residential quarter. It has hardly been touched yet by excavators; most of what has been found or uncovered here is the accidental result of soil-cultivation. We cross the remains of the old city wall, which on this very spot was seven stadia (a mile) from the temple, according to the famous story of the string by which the wall and the temple were once connected during a siege, and which, when measured, proved the city itself to be within the sanctuary limits of the holy and inviolate house of the great goddess; though I believe it has never been satisfactorily explained why the temple, the *raison d'être* of the town, was without the city walls.

We turn the corner of Mount Prion on our left, and all at once the whole glory of inner Ephesus, the business and pleasure centre, bursts upon us, as laid bare by the Austrians during the last three years. Here are the 'City' and the 'West End'—the 'City' extending from the landing-stage, along a straight, stone-flagged principal thoroughfare, composed mainly of shops, to the theatre, the 'West End' (east end in this case) clustering around the latter, with gymnasia, assembly rooms, cafés, baths, and other places of public resort.

The preservation of this part of the town is astonishing. Except that most of the roofs have fallen in, we walk about exactly as St Paul must have done scores of times. We tread the same stone flags of the 'High Street' which he trod, we stand on the steps of the landing-stage where he no doubt passed the scrutiny of the Customs officials of the period, we enter the very shops in which he and his companions bought the necessities of life.

The shops occupy generally in one apartment the whole surface of the ground floors—the houses along the 'High Street' are singularly small for so big and flourishing a city—and have side-entrances and stairs leading to the upper-floors (mostly fallen in), where the shopkeepers and craftsmen dwelt with their families. Some few have back-parlours, and all appear to have had yards or back-gardens separating them from those of the parallel streets. The stone-flagged entrances are worn-out in many degrees, some have deep ruts left by countless customers' feet, others are almost intact.

Where dwelt 'a certain man named Demetrius'? It is, of course, impossible to identify his house in a quarter a mile in length; but since he must undoubtedly have had his shop in the 'High Street'—for he was the doyen of his world-renowned craft, a prosperous and influential man—we can form a conjecture.

A thousand years elapsed between St Paul's visits and the end of Ephesus as a big city of the Byzantine Empire. It may, therefore, be argued that the 'High Street' as we see it to-day is not that of Demetrius, that its shops and houses were rebuilt perhaps a dozen times in that interval. But jerry-builders, that curse of our age, were unknown to those times. Houses were of stone—indeed of great slabs and blocks of stone—erected to last, and speculative building, surely that most immoral form of all forms of speculation, had not yet been invented. The theatre, the gymnasia, the public offices, the smaller temples, the first Christian churches, the mausolea, the market-buildings, the gates, the guard-houses, all built in the first or second century, lasted till the end of the town, as proved by the unearthed remains; why not the private houses, which were built of the same material, with the same skill, in the same manner? Let no stay-at-home savant rob us of the pleasure of an afternoon call on Demetrius the silversmith.

Here is a shop of prosperous appearance. Thanks to the Austrians, the flagged floor and the staircase are as white and clean as if a London 'step-lady' had just operated on them. The entrance-stones to the shop are worn. There is a back-parlour. In the yard a piece of a life-sized statue betrays both the piety and the taste of the occupier, who said to his fellow-craftsmen, 'Sirs, ye know that by this business we have our wealth.' I heard from an Austrian official that the bust, both arms, and one of the feet of the statue were found close by, singly and much damaged; one of the arms was spoiled by an unskilled labourer, the bust and the feet were already hopelessly damaged when found, and the intact arm was sent to Vienna. But the head was missing, as indeed most of the statues found at Ephesus were headless. The explanation of this is that Christian iconoclasts played havoc with the heathen images, and used the heads as balls for skittles.

A five minutes' walk takes us to the remains of what appears to be a big hall, say an assembly room or restaurant, or other place of public resort. Perchance here the indignation-meeting of craftsmen addressed by Demetrius took place. Two minutes more take us to the gigantic theatre, compared to which Covent Garden is an infant in size. It is practically intact. Rows upon rows, tiers upon tiers, a platform for judges or distinguished company, the proscenium, the stone-flagged circular arena covered with fresh yellow sand from the near beach after each performance, the dens for wild beasts, the cells for prisoners about to be sacrificed to the lust and the cruelty of a decadent people, the subterranean passages by which the beasts or gladiators or other performers were led to the arena, low boxes that look like pay-offices—they are all there, as white and new as if built last year. Apparently the Austrians have not quite finished here yet, for in places dwarf beeches, hawthorn, bramble, nettles, and long flowering grass grow

still in the crevices. When these will have been removed the theatre will probably be the best-preserved ruin in the world. Here is the central stone flag on which orators stood when addressing the multitude. From here their voices reached to the upmost tier, high up against the skyline. Here stood the Jew Alexander when he attempted to defend St Paul, and the town-clerk who soothed the frantic crowd.

Time presses, and we must return Ayasolukward. We do so on the other, the northern, side of the big hill, the circuit of which we shall have made by the time we have finished. Mount Prion itself, with its numerous ruins, and the extensive fortifications, partly Roman, partly Seljuk, on the hill-crest three miles west of Ephesus (a castellated line two miles long, showing grimly against the skyline), are out of the question for a one-day excursion. In fact, an exploration of these occupied me on a subsequent visit three entire days.

The business quarter is on a level with the arena of the theatre, which we have thus entered from below. The quarter which we are about to traverse is on a level with the upmost of the twenty tiers. We have, therefore, to ascend one of the steep gangways to the very top. Here we leave the theatre, turn a corner, and are suddenly amid an army of labourers, who dig and carry away the soil on trollies running on rails. A superintendent informs us that these men are now excavating the street, two miles long, which led from the theatre to the cemeteries.

For a quarter of an hour our progress is laborious and unpleasant. We sink into loose soil, step gingerly over rails, tools, stones, bits of statuary, dodge trollies, carts, and barrows, evade blows of shovel and pickaxe, seek to avoid contact with dirty, ragged, visibly verminous Greek workmen. At last we come to the site which at present hides the old Roman, Greek, and Jewish burial-grounds, and which—so we have been told—will be the next task of the Austrian excavators. A modern path follows apparently the main thoroughfare of the cemetery. On both sides, among fig-trees and olive-trees and a jungle of brambles and shrubs, are sarcophagi, a few wholly unearthed, the majority partly visible. Much has been stolen here in the course of eight centuries, much more relentlessly destroyed; but ten times as much is still hidden in mother-earth. A little apart is the well-preserved tomb of St Luke; the sarcophagus had disappeared when it was first identified by Mr Wood. From here we have a fine view of the Magnesian Gates, the principal landward entrance to the city, in almost perfect condition. Close by are the remains of a large building which inscriptions in Greek and Latin denote as the mart or exchange of the wool-merchants.

The tree and shrub bordered path ends abruptly in a sort of open space, and the transformation from classical antiquity to the sordid present is painful and sudden. For here are a dingy modern mosque with a rickety minaret, a dirty Greek café, a drinking fountain erected by a pious Ayasolukian Moslem to perpetuate his name, and the little shanty of a *kolji*, or policeman, employed by the Tobacco-Régie to prevent smuggling. We are thirsty, and the water from the fountain flows clear and sparkling into the basin, its overflow into the cattle-trough, but there is no drinking-vessel. We have said nothing; yet in a few seconds the *kolji*, in his shabby blue uniform, brings us on a tray three quaint earthenware mugs, no doubt his or his wife's own handiwork. We know the Turks, and therefore refrain from offering the small monetary return which would be expected in Christian countries. If we did he would rudely refuse and turn aside, thinking, 'These horrible Unbelievers cannot even understand that a man may do an act of kindness or hospitality simply because it is the right thing to do.'

Ten minutes more bring us to the Grand Hotel, where the meal ordered before our departure is waiting for us. Basins, soap, and towels are displayed on the spare wooden chairs of the dining-room. The visitors' book, which contains some of the most famous names in the world of travel, history, and research, is placed open on the table, with pen and ink by its side, and in a far corner are several wooden boxes containing the landlord's private trading store of curios, coins, and antiquities. We are agreeably surprised. The repast is good—indeed, very good for this part of the world—and the native wine, served gratis, is excellent. The Greek landlord himself accompanies us to the station, carrying our cameras, and wishes us a happy voyage and safe return to our homes and families.

'PIKE'S PEAK, OR BU'ST.'

DURING the past fifty years we have heard of many important gold-discoveries in various parts of the world, generally in remote and almost inaccesible regions. This is just what suits the old, case-hardened prospecter, who estimates the value of the 'strike' by the difficulty of getting there. Doubtless 'distance lends enchantment to the view.' The Californian gold-hunter will casually tell his friend that he intends starting in the afternoon for the new find in South America, which may be a thousand miles up the Amazon, in the heart of the jungle; adding, with a chuckle, that not one white man in twenty can stand the climate—so much yellow-fever and cholera, to say nothing of poisonous reptiles, hostile

Indians, &c. 'But the gravel pays an ounce to the pan, sir, and the quartz goes a thousand dollars a ton.' In all probability the speaker will quit work in a mine where he is paid four dollars a day to start on a wild-goose chase, and perish in some dismal swamp. Possibly not more than one man in three of those who started the first winter for the Klondyke ever reached Dawson City. Many turned back before half the distance had been covered, but hundreds perished in the rapids of the Yukon or were swept away by avalanches in the mountains. Many men gave up good positions in South Africa to start for these diggings, well within the Arctic Circle. One must know these old Argonauts well to realise how utterly fearless they are. As we write, the daily papers inform us that large parties are on the way to the new gold-fields near the Straits of Magellan.

In the early sixties news reached Virginia City, Nevada, of the discovery of some very rich gold-quartz veins in the foothills at the base of Pike's Peak, Colorado, about five hundred miles east. The locality was easy of access; there were no dangerous rivers to cross, and only one range of mountains. There were long stretches of alkali desert, however, so that it would be necessary to carry food for animals. The great danger was the certainty of having to run the gauntlet through tribes of hostile Indians and parties of scarcely less hostile Mormons. These treacherous white men, known in their Church as the 'destroying angels,' infested the old emigrant road, under the leadership of the notorious Bill Hickman, and acted as scouts for the Indians. Occasionally, as in the Mountain Meadows massacre, they would disguise themselves as Indians, and attack emigrants, killing the men and carrying off women and children to the Salt Lake. They undoubtedly had orders from Brigham Young and the Elders of Mormonism to prevent as far as possible any influx of Gentiles into Utah. There was an abundance of wood in the vicinity of the mines, and water for power—two necessary things for the working of gold or silver ores.

About three thousand men started from the Pacific coast on the Pike's Peak rush, and one bright morning in May 1864 found seven of us in Virginia City fully equipped for the trip.

For prospecters, we started luxuriously. We had a fine covered spring wagon drawn by four powerful mules, each animal standing sixteen hands; and in this we carried our tools, provisions, rifles, and bedding, and every man had a saddle-horse. We had arranged to start at eight in the morning; but it was fully noon before we got clear of the main street. We had many friends in town, and as we passed each saloon the proprietor and a few of our chums would sally forth and insist on our coming in to take a parting drink. Had we wished to increase the strength of our little party, we should have experienced no difficulty in inducing a hundred men to throw up their work on the Comstock and start with us. We promised all our friends to write and let them know what luck we had met with, and if we struck anything very rich to be sure and take them up claims.

Among the little party there were three experienced prospecters, men who were not only able to estimate the value of gold or silver ore, but were thoroughly good judges of quartz-lodes. One of them, years before, had discovered a very valuable vein in Australia, which had paid him in five years sixty thousand pounds; but somehow he had let it all slip through his fingers, principally on the Stock Exchange. We had a regularly ordained mining engineer, a surveyor, and an old fellow named Gale who had been a night watchman in Virginia, and had been shipped as driver, and looked after the horses and mules. And, lastly, we had a man to collect firewood, carry water, and cook.

There was a man in the party, classed as a prospecter, of whom special mention must be made on account of his strange career in Europe and the tragic fate he met with in Colorado. Captain Octavien Natthey was a Swiss by birth, a man of about fifty years of age. In youth he had held a commission in a French cavalry regiment, and had been employed by his Government in a confidential capacity as secret agent attached to the Embassy in Berlin—a diplomatic spy, in fact. He narrowly escaped arrest in Berlin, but fortunately got across the Rhine just as the German military authorities were in possession of proof that he had smuggled out of the country several plans of fortresses and the drawings of a new field-gun. After many strange adventures and hairbreadth escapes from the vengeance of anarchists whose plans he had betrayed, Natthey drifted over to America, and, having a good knowledge of mining, resolved to try his luck on the Pacific coast. We were glad to have him with us, for he was known to be a splendid rifle-shot; when he 'drew a bead' on a redskin at five hundred yards there was a 'good Injun' when he pressed the trigger.

For the first few days we averaged thirty miles a day across the Nevada plains, and camped one night on the bank of a swift-flowing stream in Humboldt County, at a little hay-ranch owned by an old fellow named Inskip. He was a surly old savage, and refused us permission to draw water from his well, compelling us to use the muddy creek-water for our coffee. During the night we held a council of war to devise some plan for crossing the narrow creek. It was too deep for the mules to haul a loaded wagon across, and the current was running at the rate of ten miles an hour, being fed by the melting snow in the mountains. There was a small 'corral' or pen for horses near the house, built up with poles about twenty feet in length, and with these we constructed an excellent foot-bridge. There was a large flat boulder in the centre of the creek, and the poles were long enough to reach from the bank to the rock, and from that point to the opposite bank. We secured them with ropes, and having

unloaded all our provisions, bedding, &c., carried everything over in safety. The mules and horses we swam across, and then, with a long rope, we pulled the empty wagon to the opposite bank. We had accomplished our task by six in the morning, and were harnessing the team, when old Inskip came to the door of his cabin, and, seeing that his 'corral' had been destroyed, grabbed his Henry rifle, and, with much profanity, assured us that he would shoot every mother's son of the party. This was annoying, for the old pirate could shoot from the shelter of the log hut; and as he hailed from South Carolina, where the natives would sooner shoot than drink whisky, we might be sure that he knew how to handle a rifle. He had been taken prisoner while fighting under 'Stonewall' Jackson in one of the early battles of the Civil War, but had escaped from the Federal pickets; he still wore his Confederate gray overcoat. To have attempted the ascent of the steep pinch ahead of us, leaving that old fellow in our rear, with a sixteen-shooter and lots of cartridges, would have been madness; he could pick off the mules, with a possible chance of a shot at one of us, from his hut without giving any opening for a return fire. Prompt action was necessary; so Bill Coons, one of our fellows who came from the same state, volunteered to go back and try to square the old fellow. A white handkerchief was raised on a whipstock, and our man crossed the bridge and advanced up to the cabin door; we could see the muzzle of the rifle covering him, but Inskip did not show hand or foot.

'Hold on, colonel, an' put up yer shootin' iron; I want to have a quiet talk with you,' said Coons.

'A quiet talk, you measly set o' jay-hawkin' bushwhackers!' replied the colonel.

'Now, colonel, it's no use yer gettin' mad about a few old poles,' remarked Coons.

'I expect yer playin' me fur a Chinaman. I tell you, sirree, thar ain't another stick o' timber growin' in this God-forsaken country, an' I had to haul them poles forty miles from the mountains,' roared Inskip; 'an' I'll shoot the stuffin' out o' every mean white man in yer party,' added the old fire-eater.

'Jest hear me talk a little sense,' answered Coons, 'an' I kin prove, if yer ain't quite a lunatic, that thar's five thousand dollars in that footbridge, more money than thar is to-day in the old Palmetto State, an' I hail from Charleston myself; that's more than yer measly old hay-ranch is worth.'

'Jest p'int that out to me, mister,' replied Inskip in a somewhat gentler tone of voice.

'Wall, it's about like this,' remarked Coons. 'Jest set to work an' fix up that bridge; make it a couple of poles wider, an' anchor it solid on the rock an' both banks. Thar's pretty near five thousand folks a-comin' along from California an' Nevada this season to Pike's Peak, an' they must pass yer ranch. Thar's over a thousand Chinamen on the road now, all carryin' their mats of rice an' stuff. Jest set up a board an' paint a sign, "Toll Bridge," an' yer can scoop in twenty-five cents a head from white men an' half-a-dollar from Chinamen. Don't yer fret; they'll come out so long as the water holds in the creek, so let's take a drink an' call it square.'

Coons, before starting on his mission, had provided himself with a flask of whisky, and we were glad to see the old fellow come to the door with a couple of tin pannikins. They drank together and shook hands, when our ambassador returned, having negotiated the treaty—'Peace with honour!' It may be mentioned that Inskip followed the advice of Coons, and for months after our arrival at Pike's Peak we were told by several new-comers that they had paid toll at his ranch.

We were making good time across the plains of Southern Utah, and had not met with any Indians, although we crossed their trail more than once. One evening we followed a road that led us to a little Mormon settlement—three or four small frame-cottages, each with a few acres in Indian corn and vegetables. The men were all absent, and none of them had more than one wife. We bought a sack of potatoes from one woman, a German, who spoke good English, and received us in a most friendly manner. We paid her for the vegetables in silver dollars, and it was amusing to see her astonishment at handling money; she told us that she had not seen a coin for three years. The trading in the Mormon settlements in those days was all done by barter; the Church stores used to supply the 'faithful' with rough clothing, groceries, farming implements, seed, &c., and take away all their crops. The bishops and elders alone could convert these into cash. We were extremely lucky in having gained the goodwill of this kind-hearted woman, for she gave us a bit of information to which many, if not all of us, owed our lives. She told us that President Young and his chief adviser, Heber Kimball, had determined to stop the influx of Gentiles into Utah by sending out the Nauvoo Legion to incite the Indians to acts of hostility, and forbidding the Mormons to hold any intercourse with them or to sell them any provisions. Furthermore, she told us that many Indians had lately been seen heading for Heber's Cañon, about fifty miles distant, and to be careful and avoid passing through it. This was startling news indeed, for our road lay directly through the narrow pass; and in it, as our chart showed, were the only springs to be met with for the following seventy miles of the journey. We expressed our gratitude to her, and promised to be guided by her advice. Before leaving we replenished her larder with many delicacies, such as tinned oysters, chicken, Worcester sauce, &c.

We followed the old emigrant road for the next two days, until we got to within about six miles of the mouth of the cañon, which was flanked on either side by steep hills, merging gradually into the plain. We soon realised that our Mormon

friend was not mistaken when she warned us of the presence of Indians in the hills, as we could distinctly see their smoke-signals. We camped near a water-hole where there was some bunch-grass for our animals, and were careful to dig a shallow hole behind our wagon for the small fire of dry sage-brush we lit for making coffee (the sage-twigs make a hot fire without giving any smoke). We sent out a scout during the night, on the fastest horse we had, to examine the country south of the hills, who, on his return, reported that, by leaving the range about two miles on our left, the road through the sage-brush was practicable for the wagon. About five next morning we started, and followed the road for about three miles before finding a good place to turn off; and, making a detour, we travelled parallel to the range for eighteen miles before halting. The sand was very heavy, and the mules were completely exhausted. The Indians were evidently disappointed by our flank movement, for we saw their smoke going up to warn those on the north side of the cañon of our line of advance. We knew that we were safe from attack during the day, and felt no alarm, although with a good field-glass we could see them riding along the side-hills, keeping abreast of us. We had filled our water-barrel at the last resting-place, so had no fear of having to make a 'dry camp' that night.

The point at which we unharnessed the mules was about a mile and a half from the range, and we were certain that we should be attacked at the hour the Indians of the plains always select—a little before sunrise—so we built no fire, but had cold whisky-and-water in place of coffee. When darkness set fairly in we went to work, in order to be able to give our friends a warm reception. We judged that there were not more than thirty of them, so we did not worry. We collected all our animals and made them fast on the off-side of the wagon, horses saddled, in case we should have to make a run for it, and cut a big pile of sage-brush sufficient to make a breastwork four feet high round the wagon, knowing that Mr Redskin has no stomach for attacking the slightest obstacle behind which his enemy may fire. The sun would rise a little after four, so we looked forward to our visitors arriving about three. The event showed that we had not miscalculated.

Our little zareba having been completed, there was nothing more to be done but remain quiet and wait. Captain Natthey had taken command, and stationed each man at his post. Our arms consisted of three Springfield rifles (an excellent weapon then used in the American army), two Henry sixteen-shooters, a Colt's repeating rifle (the captain's favourite gun), and a Westley-Richards rifle used by a Cornishman (for which he had his own cartridges, filled with heavy buckshot), a most effective weapon at close range.

A little after three, and before the faintest sound of the approaching Indians reached our ears, the animals, especially the mules, became very restive, tugging at their halters in their endeavours to get free. The sense of smell possessed by these animals is wonderfully acute, and they seem to have an instinctive dread of Indian ponies. Many a prospecter has owed his life to the fact that his mount has scented the unseen enemy, and bolted in an opposite direction, carrying his rider to safety. We knew what this restlessness meant; and, listening with our ears to the ground for a few minutes, we could distinctly hear the galloping of the Indians, who expected to find us quietly rolled up in our blankets. There was not a breath of air, but a slight haze hung over the plain; and the captain requested us not to waste cartridges on long shots, but wait patiently until we saw our Indian through the sights, and then, lying prone, each one could blaze away comfortably through such loophole as he may have made through the breastwork. Unfortunately, the atmosphere was getting very thick, so much so that each man had to rub the tip of a wet lucifer match on fore and back sights of his rifle. By that means he obtained two luminous points which enabled him to take good aim.

The Indians came down in single file, being led by the notorious Bigfoot, a bloodthirsty savage who had eluded the United States troops for years, and was reported to have the scalps of fourteen white men hanging up in his *rancheria*. He rode up to within about a hundred yards of the breastwork; and, thinking it had a somewhat uncanny look, without a moment's hesitation, wheeled round to his right, looking for an opening on the west or south face of the parallelogram. Jim Powning, the Cornishman, was on the west; and, judging Bigfoot within easy range, he sent a buckshot cartridge into the pony, which dropped him. The Indian had thrown himself completely over on the off-side as he galloped, so he presented no mark for a shot. He fired three or four times over the animal's neck, and, agile as a wild cat, in one spring he was clear of the pony. Before he could gather himself for a run the captain fired, and he fell, shot through the backbone. Bigfoot, at last, was a 'good Injun.' About a dozen of those following him circled round to the right, galloping about three lengths apart, and as many more, taking a wider sweep, tried the eastern face of the zareba. The Indian of the plains, like the Cossack, is a born horseman; with body down and one knee crooked round the horn of the saddle, he will blaze away at his enemy. You must drop his mount first, and then knock the rider over on the run.

By this time the fog had cleared, and the sun was just showing through a clear atmosphere. The Indians were circling round us at about two hundred yards, and keeping up an incessant fire from their Springfields, aiming at the wagon, in which they supposed we were lying. The only damage done by sunrise was the wounding of Bill Coons, shot through the shoulder, and we had a couple of horses killed. Whenever we dropped a pony, two or three Indians would ride up to help

the dismounted man to get away; that was our chance, and we would give them a volley. Captain Natthey preferred picking off his man on the gallop, and claimed no less than seven. With the sun shining, we knew the attack was over, and were not sorry to see the redskins starting for the hills, in single file, as they had advanced, and two lucky shots brought down the two hindmost, who were carried away, probably only wounded.

When the fight was over we went out, and counted no less than thirteen redskins. Those who were only wounded were quickly put out of pain. One vicious-looking savage, from whose chest the blood was flowing, rolled over and got hold of his rifle, but a well-planted bullet prevented his using it.

We collected nine Springfield rifles and full cartridge-belts, all bearing the U.S. brand; also two old smooth-bore shot-guns. It is horrible to think that traders at the military posts sell Government arms and ammunition to the Indians, but it is an undisputed fact. Even at the present day hostile Apaches in Arizona are frequently found armed with the latest-pattern Winchesters. An Indian will pay a hundred dollars for such a weapon and a belt of cartridges.

We felt tired after our long vigil, and soon had a good fire for breakfast, to which we did ample justice, feeling that we had done the State a service.

The remainder of the trip was made without any further trouble; and, although eighty miles off, we were delighted to see Pike's Peak lifting his snow-crowned summit nine thousand feet above sea-level. Some years ago the United States Government established an observatory up there, probably one of the loftiest weather-stations in the world. We passed a long train of wagons from Idaho, bearing on their covers in large letters the motto, 'Pike's Peak, or Bu'st.'

On arriving at Golden City, not far from where Denver, the capital of Colorado, now stands, we sold our entire outfit for a good figure. The proceeds, being divided up, gave each man sufficient to keep up his prospecting expenses for six months.

Captain Natthey gave us all a champagne supper before he left. He announced his intention of starting out to prospect the range about forty miles north of the Peak. We were sorry to lose him; for, however shady may have been his past in Europe, we had ever found him a comrade to be trusted in the hour of danger.

Within two months he discovered a very rich vein of gold-quartz, naming it the 'Eugenie,' after the French Empress, and it was not long before he had twenty men at work developing it. His success attracted many prospecters out to the new district, and the mining papers of Colorado and the Pacific States published lengthy articles on the Eugenie, together with romantic sketches of the life and adventures of the 'famous light-cavalry officer, Captain Natthey.' This publicity was just what he dreaded and was so anxious to avoid. There were many foreigners, principally Frenchmen, to be met with in the mining-camps of Colorado and the Far West. Natthey knew that he was a marked man among them, and that his doom had been pronounced at secret meetings of sundry political clubs in France. This was well known to many members of the Mafia and kindred societies, who had established lodges as far off as California, and they were pledged to carry out the death sentence in any part of the world where they should meet the man who had betrayed them and sent some of their leaders to Cayenne.

About nine months after the discovery of the Eugenie a couple of strangers rode into Golden City, then only a rough mining-town. They were of French nationality and spoke English imperfectly. They put up at the best hotel, and seemed to be well supplied with money; they represented themselves as French Canadians sent out from Montreal to examine mines. It was remarked by visitors at the hotel that they never attempted to visit any of the claims in the neighbourhood, only taking an occasional canter along the road which had been built to the Eugenie property.

Natthey, who had started a little quartz-mill on his claim, generally came into town once a month to deposit bullion in Wells Fargo's bank, and draw sufficient coin for miners' wages, purchase of supplies, &c. One evening Dr Mitchell was driving in to town in his buggy; he had gone out the day previously to perform an amputation at the Eugenie on a poor fellow whose leg had been crushed by a falling rock. When within about five miles of home, at a sharp turn in the road, his horse shied at something lying near the bank in the shadow of a big pine-tree. The doctor pulled up, and stepped down to investigate. To his horror, he found Octavien Natthey prone on his face, dead, with two bullet-holes in his back. Robbery was not the object of the murderers, for in the pocket of the dead man the gold was found which he had drawn from the bank that day. It may have been a coincidence; but the two strangers from Montreal were never seen again at their hotel.

INITIATORY.

THE fluting of the blackbird dies away,
The sea-fires slumber where the sun goes down,
The fishing fleet steals up the shimmering bay,
The lights are lit in all the little town,
The sheep are folded, and the night's white crown,
Star-jewelled, rules upon the waning day.

'Mid violets and lilies fall'n asleep
She comes with sunset in her wistful eyes,
Shy as the dawn breaks on the rain-wash'd deep.
Gentle as dreams, serene as wide white skies;
The glory of her presence on me cries,
As up the blue night love and stillness creep.

SIXTH SERIES.

IN PRAISE OF LIVERPOOL.

By KATHARINE BURRILL, Author of *The Amateur Cook*, *Loose Beads*, *Corner Stones*, &c.

IN one of the most amusing and evergreen plays, Brazil is vaguely referred to as 'Brazil, where the nuts come from.' Many people only think of Liverpool as the place from which you set sail for America: this is not a distinguishing description, as you can arrive at New York from Southampton and London! Other folk with a wider knowledge know that Gladstone was born within sound of the Mersey, and the smart and the sporting connect Liverpool with the Grand National and the Waterloo Cup. These be plain facts, 'which nobody can deny;' but if we venture so far as to talk of the beauties of Liverpool, to dwell with enthusiasm on her sunsets and her lovely seascapes and river-pictures, our hearers grow sceptical and are quite sure that we have left the solid dominion of fact for the golden-hued kingdom of fancy. To the traveller who hurries through Liverpool *en route* for somewhere else, to the Liberal politician whose pilgrimage begins and ends in Rodney Street, and to those who, like Dazzle, 'were born on a horse' and only go to Aintree, I should like to recommend Mr Dixon Scott's volume entitled *Liverpool*, a book that has many remarkable literary qualities, and is enhanced and beautified by the exquisite water-colours of Mr Hamilton Hay. There is a little anecdote of some great painter who, on being told his colouring was exaggerated, and being informed by the ordinary groundlings, 'We do not see it like that,' pleasantly replied, 'No? Well, don't you wish you could?' The proper spirit in which to read Dixon Scott's clever impressionist sketch, the right frame of mind to bring with you when you look at the pictures, is, 'If I can't—well, I wish I could, and at least I will try.' Personally, I see this good city by the river-sea in the halo of romance wrapped round it by the author, and touched with the soft, clear colourings the artist knows how to use so tenderly and well. But then Liverpool is my home, where I have my 'but and ben' and my 'bits of things;' and it may be a cat-like quality, but I grow attached to my surroundings, and feel somewhat indignant when I hear this vast city dismissed as gray, ugly, dirty, and unattractive. Therefore am I properly grateful to Mr Scott for having set out his big jars full of 'prave 'orts' and good sounding phrases, and for not having been afraid of dashing in rays of scarlet and vermilion, nor of draping his sentences in a garment of purple and crimson. Hamilton Hay has loyally aided and abetted him; and if he has made 'Electric Car Terminus, Pierhead,' look like a gorgeous Feast of Lanterns, who would not rather see that blaze of lights and rosy mists than a plain drawing of the 'harmless (?) necessary' tram? Any one can draw a representation of a tram—a child could do it on a slate with a squeaky slate-pencil; it takes an artist to show us what tramway-cars *can* look like, and to make us think of 'Jinga-Jinga ring ring Feast of Lanterns,' and wonder if Aladdin and Badroulbadour are swinging their gaily lit lamps and joining in the chorus. Perhaps the longing and love for colour—colour—colour at all costs really proves that poor, dear Liverpool is gray after all; if this is the case, let us hie ourselves to the river, where even the gray and shadowy clouds have their own peculiar beauty. With characteristic cleverness Dixon Scott begins his book with the Mersey, and I wish it were possible to quote at length all that he says of our River—the vastness and the wonder of it—'a place heavy with traditions, full of the sense of old passions.' Without the Mersey, Liverpool could not exist; even to-day, with all her multifarious interests and occupations, take away her shipping and where would she be? The shipping! Does the very word not conjure up a whole series of pictures in our minds—from the days when the little trading-smacks from Wales and Dublin now and then beached in the Pool, through the long ages lurid with fight and big with endeavour, to the ship of to-morrow that will beat the *Lusitania* and dwarf the *Baltic*? Kipling tells us we can be romantic over a railway train—the particularly dull, prosaic railway train that takes the frock-coated and top-hatted to their various

 [*All Rights Reserved.*]

forms of money-getting—or losing! No one needs to draw our attention to the romance of the sea; we feel it in our very heart's blood. Are there not many peaceful citizens sitting in their revolving office-chairs (the careful umbrella, even perhaps the still more coddlesome and careful goloshes, in the corner) who 'in the dawn of early youth' read the romances of Sindbad and Robinson Crusoe, and longed to go to sea? Perhaps there are others who, like Norrie Seaton, actually ran away to sea with their clothes (like his) packed in a bolster-case—to look nautical—and were brought ignominiously home again and scolded and birched and lessoned and office-stooled till they eventually arrived at that revolving chair. When Samuel Budgett, the successful merchant, walks on the landing-stage, and the sharp tang of the sea-breeze strikes his cheek, does not the brine-tang also touch his heart and send him back to his work softened and refreshed, full of old memories of his youth, less hard on the playful but destructive office-boy, and—perhaps—more sympathetic with the younger generation who, deep in the adventures of the Swiss Family Robinson, girds at the prospect of the Budgettian office, even though the revolving chair has castors of gold? Let us be thankful that the sea-winds play round Liverpool and sweep cleanly—albeit somewhat chillily—through her streets, to keep us a little young in heart and not entirely set on becoming millionaire Budgetts. If we were only Egyptians who knew how to appreciate their Nile, or picturesque Hindus who venerate their rivers, we might have an annual ceremony of blessing the waters to show that we are grateful to the gods that be for giving us our Mersey. When I first arrived in Liverpool, and, being ignorant, thought our sojourn there was to exculpate past sins, my heart was cheered and uplifted by two things: the Liver Bird, that stately and stork-like emblem of the city, and the silver oar carried before the Lord Mayor. I felt no city could be devoid of romance that owned an oar, and the Liver Bird seemed cheerful and friendly; heraldic possibly in origin, but why not also mythological and own cousin to the hippogriff of Leigh Hunt, to the Phœnix and Alice in Wonderland's gryphon? In my original ignorance I thought of the Liver Birds building their happy nests by the side of the Pool, and eventually disappearing (along with the Pool) only to return from shadowland to brood protectingly over the city that has risen where their willow-woven homes once stood. Alas! I am credibly informed that, like Sairey Gamp's Mrs Harris, 'there is no sich person,' and that there never were any birds at all. Mercifully, there really was a pool, and in an old book I discovered that 'Liverpool' is supposed to have come from the Welsh words 'Lle'r pwll'—place on the pool; this of course entirely disposes of the poor Liver! When, in the year of grace 1907, we indulged in a Pageant, many gibes were cast at Liverpool for being so comparatively modern. York, Ripon, and Chester, with their ancient charters, look upon us as a mere mushroom growth; if we are so painfully young, can we not retaliate by saying, 'Is there no merit in having done so much in such a little while?' Besides, a charter given in the reign of King John of most unfortunate memory is hardly a thing of last week. I grant you that it is a pity we are not connected with a more reputable king, though it says much for the Lackland's perspicacity that he realised the value and importance of the land along the shores of the Mersey. It seems somewhat sad that poor King John could not know how well this venture has turned out, most of his exploits being so singularly unsuccessful; our river full to overflowing with ships would more than compensate for that unfortunate affair on the banks of the Wash!

The Pageant proved that, though commercial, we could present pictures of stirring times, and if any one wishes to know how we battled our way from the earliest days he cannot do better than read Professor Ramsay Muir's excellent *History of Liverpool*, published a year ago. Liverpool has had its own fair share of fighting and been well battered by both Royalists and Roundheads; to those of us who own allegiance to the Stuarts it is pleasant to remember—with all Lancashire turned Cromwellian—that Lathom and Liverpool stood solid for King Charles. At a later date the Liverpolitans became staunch Hanoverians—perhaps it showed their good sense—but it rather grieves us to hear of thirteen tons of biscuits sent to the Duke of Cumberland. Would those biscuits not have loomed more picturesque and interesting had they gone to Bonnie Prince Charlie and his ragged and faithful Highlanders! However, the Liverpool merchants knew their own business best—'the Butcher' had the biscuits and Charlie had none; not only was he biscuitless, but had he ventured near the Mersey he would have met with a warm reception, for 'a regiment of foot, called the Liverpool Blues, was raised for the King's service, equipped by a subscription of six thousand pounds; while in addition seven companies of volunteers for local service were raised and officered by leading townsmen.' All these well-drilled citizens were waiting for the first sight of the Highland Host, their motto 'Defence, not Defiance;' but when the Highlanders did not appear they marched out towards Warrington, destroyed many bridges, and, discovering a remnant of the Highland Host, left it still more a remnant than they found it. Liverpool had no time for discontented Jacobites upsetting their trading and interfering with their comfortable prosperity. It is so long ago—or so it seems, for what, after all, *is* one hundred years?—that to-day it is difficult to be properly thrilled and horrified when we think that much of Liverpool's wealth and prosperity came from the slave-trade. Madame Sans Gêne tells Napoleon's sisters that their crowns are covered with blood, and neither of the Queens is much distressed. When Cooke the actor shouted at his audience of Liverpool

merchants, 'Every brick of your detestable town is cemented by the blood of a negro slave!' I have no doubt each merchant thought *his* house free of such unpleasant cement and *his* sovereigns clean in the handling, whatever the houses and wealth of his next-door neighbours might be. When you read of them they seem so decent and kindly and respectable, these old Liverpool traders in 'black ivory,' that it is hard to believe that they could have sanctioned or known of the suffering and misery inflicted on their human merchandise. We may not excuse their possible ignorance, but we *can* offer up all praise and honour to those who bravely fought for the abolition of this evil, 'which had brought upon the town a flood of wealth, but brought upon it also the responsibility for an ocean of suffering and tears.' That the merchants at the back of their minds were a little doubtful of their trade in 'sable-hued ivory' is proved by the anecdote of the medical student who let a negro's head fall out of a bag in a steep street—not a hundred miles from Liverpool!—where it rolled and bumped till it stopped and loudly knocked at the door of an old slave-dealer, scaring that same respectable slave-dealer almost out of his wits. 'Conscience makes cowards of us all.'

In the agitation against this abominable practice one name stands out like a star, that of William Roscoe, one of the greatest, if not *the* greatest, of Liverpool's citizens. At the early age of nineteen, when the slave-trade merrily (for the merchant) and mournfully (for the slave) held its way, long before any doubt was cast upon the integrity of the merchants or the lawful character of their proceedings, Roscoe dared to put his views into verse. At a later date, when the anti-slavery movement was in full blast, he again wrote a long poem, calling it 'The Wrongs of Africa;' and it was always to him a matter of satisfaction that though only in Parliament for three months he was yet able to record his vote on the side of humanity and justice. All over and passed away one hundred years ago, gone the merchants who acquired the wealth, gone the poor slaves who gave it to them—though the pillars they were chained to still stand (or stood till very lately) in Goree Piazza; if there were sorrowful blood and tears mixed with our building, have not the generous charities, the noble benefactions, of our merchant-princes washed them away for ever?

In a neat little volume entitled *The Stranger in Liverpool* we are told, 'The general character and manners of the inhabitants, as they assume no characteristic peculiarly striking to distinguish them from those of other towns similar in pursuits, need not detain our attention.' I do not quite know what distinguishing features the writer had expected to find in 1846; but Dixon Scott has charming things to say of the populace in 1907. He finds the maidens—the far-famed Lancashire Lassies—not only fair to see but also 'tall and large-limbed, more Hebe than Diana, with the grace of swiftness rather than of languor, and a mode of gowning that deals directly with the body's needs; and so the body, being so admirably fashioned, immensely rejoices the eye.' And he goes on—with colour and rhythm—to describe the Liverpolitan Hebes' complexions as mixtures of bronze and rose. Well! well! Mr Dixon Scott is luckier 'whene'er he takes his walks abroad' than I am, for the beauty that one sees does not make to exclaim—as the French would phrase it; indeed, I am more inclined to agree with the anonymous writer of 1846, and say the ordinary passers-by 'need not detain our attention.' But the other populace, that which we may call the extraordinary, is ever interesting; I mean the vast hordes of peoples from all over the world who descend upon Liverpool, using it—poor weary souls!—as a resting-place ere they start on their long, strange journey to a new and far-off country. Dark-eyed Italians, with their gaily coloured head-coverings; Viking-like Northerners, with high boots and muff-shaped fur hats; Lascars, whose thin suits look shiveringly chilly; the cheerful and widely smiling 'coloured gentleman'—very different from his poor ancestors who crouched and cowered in Back Goree; Japanese; Chinese; even, I have no doubt, Stevenson's Moldavian Jew, all move across the pedestrian's vision like the changing pieces of a kaleidoscope. And it is the River—our wonderful and beautiful River—that causes these ever-varying pictures; the River brings them to us and the River takes them away again, carries them all seawards, down the road that is unchanging and Eternal, and yet shows us a new and different beauty every time we stand on the landing-stage, to watch a stately liner weigh anchor, or perhaps only to breathe the salt-tinged air and to send up a pæan of thankfulness that though we may live in a man-built city, yet are we by the shores of a God-given sea.

One road leads to London,
  One road leads to Wales;
My road leads me seawards
  To the white dipping sails.

One road leads to the River
  As it goes singing slow;
My road leads to the shipping
  Where the bronzed sailors go—

Leads me, lures me, calls me
  To salt, green, tossing sea;
A road without earth's road-dust
  Is the right road for me.

CASIMIR LE SOMBRE.

CHAPTER III.

IT was a dangerous thing in Russian Poland to speak one's mind freely; there had been cases, not so very long ago, of noble Poles who had had their tongues cut out by the common executioner, or been publicly whipped and sent the weary journey to Siberia, for an imprudent speech, distasteful to the autocrat of All the Russias, which had found its way to official circles by some mysterious agency; for walls have strangely sharp ears in Poland. Still, in the privacy of the family party I had heard tales told, with bated breath and many an anxious glance towards the door, of Russian barbarity and lack of justice that made my blood boil. What wonder, then, that I began to hate the Russians as deeply and fiercely as all around me?

Not least was my indignation aroused at the brutal treatment accorded to my own sex by our Muscovite masters. A drunken peasant tied his wife to a tree, in the depth of winter, and beat her mercilessly; but when the neighbours brought him before the commandant, that officer merely remarked pleasantly that if a man might not beat his own wife, whom might he beat? The man then asked the commandant to punish his wife for complaining of his treatment, whereupon she was promptly condemned to receive a severe scourging —*pour encourager les autres.*

Another time some fanatical Russian boors actually burnt a poor old woman alive, pretending she was a witch; but all the punishment they got was to be sent to their 'pope' or priest for 'admonition;' and he, good man, probably praised them for their zeal.

None but those who were in Poland at that time can tell how ardently we ladies longed that Poland's sons could rise up and shake off this tyranny at whatever sacrifice. Nor was it long before I became aware that there was an undercurrent of mystery about my host's movements and our life at the castle, which, however, was never alluded to.

Sledges would come and go in the night-time, whose occupants we did not see; the Count would leave in the morning, ostensibly to visit a distant part of his vast estates—for in Poland a large property sometimes contains a quarter of a million acres—and yet at night I would be sure that I heard his step in the corridor.

One day in particular I was struck with the strangeness of his behaviour. We were all sitting drinking tea in the parlour and chatting gaily with two Italian gentlemen who had arrived the day before. The Countess was rallying me on my passion for manly exercises, and had laughingly challenged our two guests to shoot a rifle-match with me on the following morning, in which she confidently predicted that they would be the losers, when an old servant who acted as major-domo hurriedly thrust his head in at the door—the only one in the room—and uttered a few words rapidly in Polish, the meaning of which I was not then able to understand. I shall never forget the effect they had on the Countess. Her face, when she turned to her husband, was as pale as the driven snow outside; the smile had faded from lips and eyes, and in its place was a wild and hunted expression such as I have seen in the face of a stag when the hounds close round him.

However, the Count smiled reassuringly, and, speaking in French, said:

'Hasten, Deotima, to welcome our guest. Mademoiselle'—looking at me—'will accompany you, I have no doubt. We must show him every hospitality.'

The Countess gave a little sigh, and then, assuming a more lively air, said, 'Come along, Gabrielle; we have got a distinguished visitor.' and, linking her arm in mine, drew me towards the door. I have before remarked that there was only one in the room, and we had hardly reached it before the jingle of a scabbard and spurs was heard outside, and a tall, handsome man, in the undress uniform of a Russian general, entered.

He bowed somewhat stiffly to the Countess, who, however, received him with a quiet and gracious dignity quite different from her nervous manner of the moment before, and courteously invited him to warm himself at the fire, which was crackling and blazing cheerily in a mighty grate at the upper end of the apartment. Thereupon we all turned round, and I expected to see my host coming forward, as usual, with outstretched hands and the words of kindly welcome on his lips with which he knew so well how to greet a newly arrived guest; but, to my astonishment, both he and his friends had vanished.

The snow still lay, as the wind had drifted it, against the closely shut double windows. They had certainly not passed through the door, and though the chimney was large, the heat of the fire precluded all possibility of escape by that means; yet they had disappeared as silently and suddenly as if they had been spirits of the air. I should have uttered an exclamation of surprise had not a sudden pressure of Deotima's hand on my arm restrained me, and the duty of entertaining our guest, for the moment, forced me to think of other matters.

'I trust, Prince, your visit this time will not be so short as the last,' said the Countess hospitably, though it seemed to me with a slight ring of anxiety in her voice, as she handed him a glass of steaming tea. 'My husband is going to have a wolf-hunt the day after to-morrow, if you can honour us with your company till then.'

'A thousand thanks! I should have been delighted,' replied the General, 'but I fear my stay must be brief. By the way, it was to see the Count that I paid you this hurried visit, which I fear must rather have surprised you,' he added, eying her keenly. 'Can you tell me where I shall find him? I thought they told me in the hall that he was with you here?'

'He was here a few minutes ago,' she answered carelessly, 'but he went to look at a horse that is ill. Oh, here he comes again;' and as she spoke the Count entered by the door alone.

'Prince W. wishes to speak to you on business, dear, and will doubtless be glad to excuse us,' she said, rising, and, with a stately bow, moving towards the door, followed by me. As soon as we were in the passage she whispered in my ear, 'Ask no questions about what you have seen, and do not mention the two gentlemen who have been staying with us. I cannot explain now, but do this for my sake;' and she hurried to her room.

CHAPTER IV.

IT was a bright starlight night, and, being unable to sleep the evening after these events, I sat till a late hour gazing out of my window, dreamily watching the glistening wreaths of snow swaying gently to and fro like lace on the feathery boughs of the pines. The General had supped with us; but the two Italian gentlemen had not appeared, and I was speculating on their strange conduct, when I saw three figures closely muffled in furs steal softly across the open ground at the back of the château and disappear in the shadow of the forest. A little later a sledge drawn by two powerful horses, without bells, swept noiselessly across an opening in the trees, and one only of the figures returned towards the house; as he passed beneath my window he lifted his head, and, the light falling on his face, I recognised the features of my host.

Next morning, as I expected, neither of the Italian gentlemen came to claim his rifle-match; and indeed I saw no more of them till long afterwards, when I met them under circumstances in which they did not know me.

The Russian General left us in the course of the day, accompanied by the Count, and then, for the first time, I had an opportunity of speaking to Deotima alone.

I found her in the library, a noble apartment with a magnificent fretted ceiling of carved woodwork; the great oak presses to match, entirely covering two of the walls, being full of the Count's rare collection of books and manuscripts. At one end rose the gilt tubes of an antique organ, on which Deotima loved to play during the long winter evenings, while at the western extremity the room was lighted by a fine stained-glass window, displaying the arms and quarterings of the Czartoryskas, which opened to the floor, and gave access to a special iron staircase leading to a flower-garden below. This garden was formed artificially on a broad terrace of rock, and commanded a splendid view of the surrounding country; for, though the château stood on a level with the forest at the back, on this side the ground fell away abruptly in a rugged precipice to the banks of a small river, now frozen over, but which in the summer glided smoothly through the wooded plain below to join its waters with the distant Vistula, the silver line of which on a clear day could be seen gleaming on the horizon.

'The Countess's garden,' as it was called, was our favourite summer resort, and it was full of laburnums, acacias, lilacs, wild jessamine, and other flowering shrubs, which then filled the air with their fragrance, but now were sleeping snugly under their soft, warm covering of snow.

Deotima was sitting at a great carved table on which lay scattered such new books and newspapers as we were permitted to see, for the post-office officials confiscated all newspapers containing articles reflecting in any way on Russian policy, and cut out or effaced doubtful paragraphs in those few which they allowed to pass. Her face was buried in her hands, over which her soft brown hair fell in mazy confusion, and as she lifted her head and turned her large gray eyes on mine I could see the traces of recent tears in them, while the dazzling whiteness, or rather pallor, of her complexion contrasted strangely with the sombre black of her mourning dress. She looked at first a little hurt that I should have intruded on her grief; but when I knelt beside her, and, winding my arms around her waist, begged her to confide her troubles to me, she answered gently, 'If I have not done so before, rest assured it is not for any lack of trust in *you*, Gabrielle; you are French, and the French have always been true friends to us; but I did not like to burden your young life with a knowledge of secrets that may expose you to dangers which we alone of Polish birth are called upon to risk.'

'And do you think, if danger there be, that I would shrink from sharing it with you?' I cried indignantly, thinking less, I am afraid, of the kindness of her motive than of the inferior part she assigned me. 'If I am not a Pole by birth, you know well that I am a Pole at heart, and there is no danger for the sake of Poland which you can brave that I will not dare.'

'Come, come,' she said, 'you must not be angry with me. You have seen too much not to guess that there is a secret understanding between my husband and some of his friends, and I will now confide to you—— Hush! what was that noise?'

I sprang to the door and tore it open, but there was no one there.

'I will now confide to you,' she continued in a low voice, 'that we are on the eve of a general rising which we believe and trust will open up a noble future of freedom and prosperity to our beloved

country, and once for all shake off the trammels of the Russian yoke. My husband'—and here her eyes flashed proudly—'is a leader of the National Committee, as befits one of his name and traditions; but we have many dangers before us, and what you saw yesterday was only *one* example of the risk we daily run.

'Had Prince W. discovered that those two gentlemen, who are not Italians but Polish exiles, had recrossed the frontier, within twelve hours both they and we should have been in chains, and the whole of our glorious scheme might have been frustrated before it reached maturity. The Prince knows their faces well, for he has met them in Switzerland; but luckily we have a secret passage, though I forgot it at the moment, by which they were able to escape.

'Oh! you do not know what it is to be involved in the meshes of a conspiracy,' she cried excitedly; 'to live in daily and hourly dread of discovery; to distrust all about you, even those who eat your bread and wait at your table; to know that all related to you are involved in your danger from the mere fact of their relationship; to have, as yesterday, to smile welcome to the oppressor who would load us with chains and bare our backs to the scourge if he could read our innermost hearts; to be ever acting a part repugnant to every feeling of truth and honesty; and yet to know that a *single* unguarded word, a misplaced trust, may sacrifice the lives of those nearest and dearest to us. They say cunning and deceit are the weapons of the slave. But why did they make us slaves?

'No, Gabrielle,' she continued, at last mastering her emotion and stroking my head gently, 'do not seek to share our confidence; return to your happy France before you are entangled in this net of danger and deceit. It is right that *we* should risk our lives for our country, though sometimes I begin to doubt whether underhand means are ever acceptable to God; but, at least, let it not be said that I was base enough to drag my friend down in my ruin.'

This speech of Deotima's had the very contrary effect to that she had intended. All the romance which a lonely life among woods and mountains had instilled into my nature was aroused at the sight of her distress, and I implored her passionately to let me share her danger and enlist in her enterprise, even though it cost me my life. Trained early to habits of self-reliance, and of a sanguine and adventurous temperament, the difficulties which she lamented seemed to *me* only fresh incentives to action; and as I pictured in glowing words the people of Poland rising victorious like the Swiss of old, and casting off their chains for ever, the colour returned to her cheeks, and she soon became as elated and hopeful as myself.

(To be continued.)

HONEYCOMBING THE ALPS.

ALL ABOUT THE NEW MAMMOTH TUNNELS THROUGH THE PLAYGROUND OF EUROPE.

By H. G. Archer.

ONLY a short time ago, when the completion of the Simplon Tunnel was the topic of the day, it was thought that the time was far distant when the Alps would again be pierced by a great tunnel. But we now know for certain that the Simplon will not long continue to represent the climax of the tunnel-maker's art. Ever since the inauguration of the Simplon route on 1st June 1906, central Europe has been flooded with tunnel-literature setting forth the advantages of the multitudinous schemes which are afloat for the construction of additional Alpine perforations. The majority of these projects are far from being of a will-o'-the-wisp-like nature, inasmuch as they represent well-thought-out schemes, promoted at considerable expense by responsible authorities, backed by sound technical recommendations, and in receipt of serious consideration on the part of the respective Governments. One of these new tunnels is begun; one or two others have been guaranteed the requisite subventions; while, distinct from the above, there is a cluster of shorter but none the less important perforations which are on the verge of being opened for traffic.

The following are the great Alpine tunnels at present constructed: Mont Cenis (1857–70), 7 miles 1730 yards; St Gotthard (1872–80), 9 miles 469 yards; Arlberg (1878–83), 6 miles 550 yards; Albula (1899–1903), 3 miles 1150 yards; Simplon (1898–1905), 12 miles 537 yards.

The Mont Cenis, St Gotthard, and Arlberg Tunnels form a class by themselves. Each accommodates two lines of way; hence they measure 26 feet in width by 21 feet in height. Then they are high-level tunnels, for the reason that they were undertaken at a period when no alternative to steam locomotion was considered to be within the bounds of practicability. Consequently the problem of securing efficient ventilation with the smoke and gases discharged by steam-engines rendered it imperative that they should be as short as possible.

It will be obvious that a high-level tunnel through the immense barriers formed by the Alpine ranges entails long and steeply graded ascents to its portals. The Mont Cenis Tunnel has a maximum altitude of 4248 feet above sea-level, the incline on the Italian side being 1 in 33 and on the French 1 in 40. The highest point reached by the St Gotthard Tunnel is 3787 feet, and the maximum gradient on the approaches is 1 in 50. The Arlberg line has climbed up to an altitude of

4300 feet by the time the centre of the tunnel is reached, and its approaches are almost as steep as those on the St Gotthard.

The Albula Tunnel occurs on the Engadine Railway, a narrow-gauge single line from Thusis to St Moritz, which caters principally for tourist traffic.

The Simplon Tunnel differs considerably from the foregoing. The conformation of the barrier which it pierces compelled an abnormally long low-level tunnel. This, however, has its compensations. The altitudes of the northern and southern portals are respectively 2251 feet and 2080 feet above sea-level, while the summit-level inside is only 2313 feet; therefore the gradients inside the Simplon Tunnel are comparatively gentle—namely, 2 per cent. ascending from the north and 7 per cent. descending to the south.

But while the Simplon is the least steeply graded, and therefore the most economical to operate, of any transalpine railway so far constructed, the tunnel itself achieves a fresh record in respect of depth. The depth of its axis beneath the surface averages 3740 feet, and where the frontier between Switzerland and Italy is crossed attains the phenomenal depth of 7000 feet. The deepest point in the St Gotthard Tunnel is 6076 feet, in the Mont Cenis 4090 feet, and in the Arlberg 1600 feet.

Owing to the abnormal length and depth of the Simplon Tunnel, the engineers realised that special arrangements must be devised in order both to overcome the very high degrees of temperature which would emanate from the rock during construction, and to effect the ventilation of the tube when trains were running, their calculations in this latter respect being based upon the assumption that steam traction would still be employed. To solve these problems they decided upon an entirely novel system of piercing—namely, twin single-track tunnels, spaced 56 feet apart axis from axis, and interconnected by means of transverse galleries every 660 feet; the idea being that each bore should act as a ventilation-shaft to the other. The two bores were advanced coequally, but for the present only the eastern one—which measures from 14¼ feet to 16½ feet in width by 18 feet in height—is used for traffic; while the auxiliary tunnel—the existence of which greatly facilitated the work of construction, just as it now simplifies the system of ventilation—measures 10 feet in width by 8 feet in height.

Long before the work was completed the rapid progress of the science of electric traction pointed to the feasibility of operating the tunnel electrically, and this improvement has come to pass. The electric locomotives somewhat resemble in appearance those employed on the Metropolitan Railway to Harrow; but, of course, they are far bigger, heavier, and more powerful. The system installed is, however, on a totally different principle from that in vogue with electric railways in this country, and the current is transmitted to the motors by means of a bow-shaped collector on the roof of the locomotive engaging with an overhead wire. A scientific analysis of the air in the Simplon Tunnel has revealed it to be freer from gases than that in any other Alpine tunnel. The elaborate system of ventilation is accomplished as follows: Directly a train enters, both the entrance to the running tunnel and the opposite end of the auxiliary tunnel are closed by means of flexible screens which descend like a theatrical drop-scene. At the same time, the powerful fans installed at each extremity begin delivering air into the tunnel and exhausting the foul air. The air driven in at the point of train-entrance is near mid-tunnel reinforced and cooled by that which arrives from the opposite end along the auxiliary tunnel, this second current being then directed backwards towards the point of its entry through one of the transverse shafts, which is left open for the purpose (all of the others being blocked up), and so flows in parallel with the current in the main tunnel. The flexible screens are made of light substance, so that should they fail to rise in due time for the passing of a train the collision would be unattended by serious consequences.

The cost of the Simplon Tunnel, as at present constructed, was £3,120,000. During the short time that has elapsed since it was opened such an enormous stream of traffic has flowed along the new route that it has been decided at once to proceed with the duplication of the line by enlarging the auxiliary tunnel to its full dimensions, which task will occupy about three years and cost another £1,600,000, and also with shortening the approaches from the north.

This brings us to the subject of the new Alpine tunnels, for the fundamental portion of the latter scheme is represented by what is known as the Loetschberg Railway, furnishing a fifth great Alpine tunnel, piercing the Bernese Alps. The object of the Loetschberg line is to shorten the approaches to the Simplon from central Switzerland, Germany, and north-western Europe generally. From the transcontinental standpoint, the completion of the Loetschberg Railway will be attended by the diversion of the major portion of the traffic passing into and out of Italy *vid* the Simplon—that is, the traffic which originates in England and northern France—from the lines *vid* Paris, Dijon, Pontarlier, Vallorbe, and Lausanne to those *viâ* Laon, Reims, Chaumont, Belfort, Mulhausen, Basle, Berne, and Thun. The south-bound traveller who enters the Continent at Calais or Boulogne will no longer pass through Paris; on the other hand, he will be borne through Berne, the capital of Switzerland. By this means the length of the direct journey between Calais and Milan will be shortened from 725 miles to 672½ miles, while that between Paris and Milan will become 511 miles instead of 523 miles in length. Moreover, the Loetschberg Railway will prove of vast commercial importance to central Switzerland, and particularly to the canton and city of Berne, by affording a much more direct means of communica-

tion with Italy than at present exists either *vid* the St Gotthard Tunnel on the east, or else *vid* the wide detour to Lausanne and thence along the west to east line up the Rhone valley, in order to reach the Simplon.

The Loetschberg Railway begins at Frütigen, already in rail communication with Berne *vid* Thun and Spiez. The new line ascends the Kander valley to the plateau of Kandersteg, where the northern portal of the great tunnel is situated. In order to minimise the steepness of the ascent of the Kander valley, the line winds about considerably, and at Mittholz there will be a short helical tunnel.

The great tunnel will pierce the Schafberg, a peak 8440 feet in height, and pass underneath the Gastern valley and the Loetschen Pass, emerging at Goppenstein, in the lower part of the latter pass. The distance from portal to portal is 13,735 mètres, or 8·53 miles, and the alignment of the perforation is dead straight. It was originally proposed to bore the tunnel on the same principle as the Simplon —that is, to make one single-line tunnel to start with, and supplement it with another lying parallel when a double line became necessary. But as the Simplon Tunnel route is now being doubled, the Loetschberg Tunnel also must accommodate two lines of way. Accordingly the profile will be given the dimensions common to double-track perforations. And the same reasons explain why the Loetschberg Railway will be operated electrically on the system which prevails on the Simplon.

The gradients in the tunnel itself are 1 in 143 ascending from the north, and 1 in 263 descending to the south, the ascent and descent being of equal length; while at the summit of the perforation, which reaches an altitude of 4000 feet above sea-level, there will be a perfectly level stretch, where, if necessity arises, trains can be shunted or transferred from one track to the other.

The great altitude of the Loetschberg line compared with the Simplon is due to the conformation of the ground traversed, a very low level being possible in the case of the peaky mass of the Grand Alps pierced by the Simplon, but impracticable in the broader mass of the lower heights of the Bernese Alps. Any decrease in the level at which the latter must be traversed by tunnel to carry a line from Thun to Brigue at once involved the necessity of longer tunnels and a corresponding expense for the boring; and after deep study of the two different projects for high and low level lines respectively, it was decided to adopt the former, because of its greatly reduced cost, as compared with the longer low-level tunnel proposed, which would have lain to the west under the Wildstrubel mountain and Gemmi Pass. This decision was also influenced by the consideration that electric current derived from water-power would be employed for traction; and as water-power is very plentiful in these regions, the usual question of the cost for fuel in hauling heavy trains up long, steep inclines by steam locomotives became negligible.

From Goppenstein the Loetschberg Railway will descend gently by a series of sweeping curves and threading a number of short tunnels into the Rhone valley, where it will effect a junction with the present northern approach-line to the Simplon from Lausanne at Raron, 8½ miles west of Brigue.

The total length of the Loetschberg Railway from Frütigen to Raron will be 26½ miles; and besides the great tunnel there will be thirty-three others, forming about 22 per cent. of the total length of the lines of access to the former.

The entire contract has been let by a syndicate of Parisian capitalists for the sum of £3,500,000 sterling, and the work must be completed and ready for traffic by 1st September 1911. No time is being lost. The hand-excavation of the big tunnel was begun in October 1906, and machine-boring in March 1907. On the north side three hundred and seventy-seven men are employed, and three hundred and eleven on the south side. The drills used are of percussion type, worked by compressed air, and there are three blasts daily.

For scenic attractions the Loetschberg line will present more variety than the Lausanne-Brigue route; indeed, the former will vie with the magnificent panorama of gorges, torrents, snow-peaks, and glaciers which unfolds itself on the St Gotthard route.

The last link in perfecting the Simplon approaches will take the form of new and better means of access to either Berne or Thun direct from the system of the French Eastern Railway—namely, the remodelling of the existing line from Delle to Dellemont and Moutier, and the construction of a railway from Moutier to Solothurn (Soleure), which will pierce the Juras by a great tunnel about six miles in length, passing underneath the Weissenstein. This will effect a further saving of many miles, and avoid any necessity of French travellers passing through Basle.

Notwithstanding the augmented facilities provided by the opening of the Simplon route, the St Gotthard is doing better than ever; indeed, the latter achieved its record traffic receipts during the first year of its rival's existence. On the other hand, the Mont Cenis route has been very adversely affected by the competition of the Simplon. The French now find that they have been disappointed in their hopes that the Simplon would prove advantageous to their interests by winning back for their railways a goodly portion of the transcontinental traffic lost since the opening of the St Gotthard. Prior to the inauguration of the Simplon, Marseilles had enjoyed almost a monopoly of the vast traffic in cereals imported into Switzerland; but Genoa has now become a formidable rival to the French Mediterranean port in this and other respects, inasmuch as it has been brought nearly one hundred miles nearer to western Switzerland. Moreover, from a purely commercial standpoint, the new

northern approaches to the Simplon will be the reverse of beneficial to France.

Accordingly the French will have to embark upon heroic measures unless they are to find themselves utterly shelved as a transcontinental trade-artery, and in order to balance matters they have the following projects in contemplation:

Firstly, it has been decided to electrify the Mont Cenis Tunnel for the purpose of decreasing the enormous cost of operation on its steep grades and rendering it more attractive to travellers, who complain of the heat and suffocating fumes engendered by steam locomotives.

Secondly, there is the grandiose scheme of a Faucille Pass-cum-Mont Blanc Railway, for which trial borings are already being conducted. This line would be 47 miles in length and have 24 miles of tunnel, the three longest perforations being respectively 9·4 miles, 6·6 miles, and 4 miles long. The Mont Blanc Railway would still use the existing line from Geneva to Chamonix in order to connect with a new transalpine railway from Chamonix to Aosta, in the valley of the Po. The approximate length of this line would be 36 miles, including a tunnel of 11·18 miles, crossing Mont Blanc, its highest point being 6447 feet above the sea. As this railway would carry a very heavy traffic, the maximum gradient on the Italian side is fixed at 12·5 per 1000, which would then accord with the existing line from Aosta to Turin. The estimated cost of the entire scheme amounts to £11,000,000.

This stupendous undertaking would give little, if any, advantage in respect of mileage over the Loetschberg-Simplon route, so far as the traffic between the north-west of Europe and Italy and the East is concerned, but it would be generally better on both technical and financial grounds than any other existing or possible line. Its importance to French interests cannot be overrated, for, with the exception of a small diversion on to Swiss territory at Geneva, the line would be wholly on French and Italian soil.

A new Alpine tunnel, though on a railway of merely local importance, albeit it is a standard-gauge line, was completed a few months ago. This is the Ricken Tunnel, piercing the watershed between the rivers Linth and Thur, on the new railway from Utznach to Wattwyl. This line, which exploits a charming summer tourist district, and is intended to link up the Lake of Constance and Toggenburg with the Lake of Zurich and the interior of Switzerland, is only 9 miles long, of which the single-track tunnel accounts for 5·34 miles. The work was begun in 1904, and should have been finished in 1907; but in the spring of that year unforeseen difficulties were encountered at the south end. There was a formidable outbreak of gas fumes, and the gas had to be left to burn itself out, whilst work was continued on the masonry in the rear.

Now for the tunnel which is to eclipse all precedent. Fired by the success of the Simplon Tunnel, the Swiss eastern cantons are determined to obtain better communication with the south by means of either a Splugen or Greina railway, for each of which a number of rival traces have been prepared. Colonel Locher, who engineered the wonderful Mont Pilatus railway, is backing the Splugen scheme, and his opinion carries great weight with the Swiss and Italian authorities. The railway across the Splugen would extend from Coire to Chiavenna, a distance of 51 miles, and the main tunnel through the Splugen would be just under 17 miles in length, out of which 8·65 miles would be on Swiss territory. The entire line, including the main tunnel, would be of ordinary construction, and the total cost is set down at about £5,000,000 sterling. The undertaking would occupy eight years to carry out. Steam would be employed for traction between Coire and Rothenbrunnen, while the section from Rothenbrunnen to Chiavenna would be worked electrically.

The present summer witnesses the opening of a new Austrian railway between Salzburg and Trieste, *viâ* Bad Gastein and Villach, forming the new alternative Alpine railway connection between northern Austria and the Adriatic, and constituting the last word in the development of the port of Trieste. This railway, which consists of two distinct sections—namely, Bad Gastein to Lienz, and Villach and Klagenfurt to Trieste—is remarkable both for the magnificent scenery traversed and the colossal character of the engineering works. The line attains an altitude of 4018 feet above sea-level. There are also three great tunnels piercing the northern regions of the Austrian Alps—namely, the Tauern, 5·25 miles; Karawanken, 4·95 miles; and Wochheimer, 3·93 miles; together with shorter ones—making a grand total of 15½ miles of tunnelling. The Tauern and Karawanken are double-track tunnels, while the Wochheimer consists of a parallel pair of single-line perforations. The saving in distance effected by the new railways amounts to 150 miles.

Lastly, the plans for building a line some 40 miles in length between Genoa and Tortona, so as to place Genoa and Milan in more direct communication with one another, has received the approval of the Italian Government, and it is now merely a question as to whether the latter or a private syndicate shall carry it into effect. This railway will burrow under the Apennines between Rigoroso and Secca by means of a tunnel 12¼ miles long. The tunnel is to have one opening at each end, with a double track, not in parallel duplicate like the Simplon. The cost of the tunnel, permanent way, &c. is estimated at £3,100,000.

THE PAST—AND ISMÈRIE.

PART II.

AT 2 A.M. in the morning the sentry of the Ninth Infantry, posted on guard over the Government stores on the quay, was more than ever of opinion that his duty was a superfluous one. His captain, now selfishly asleep in comfort at Fort Pedro, was ridiculously fidgety; and when awake he had no consideration for his overworked privates. Never was a more unnecessary or irksome post. He scowled at the pile of stores and guns under the tarpaulins with resentment.

A distant electric lamp on the wharf cast a brilliant circle of light over a small radius and made the surrounding darkness more intense. The masts and funnels of the great black steamships loomed up in silhouette against the cloudy sky, their decks deserted, their shore-gangways forsaken. Except the faint ripples lapping against the quays or the crunch of a grinding fender, there was no sound. Far along the wharf a small glow shone on the *Bulwana's* forward hatch, and one of her ports was lit; but in the gloom of the night she was nothing to the soldier save a towering shape in a region of utter darkness. He ceased stamping aimlessly round his beat, and sat down sulkily on a gun-limber which projected conveniently from the heap. This a sentry should not do.

The silence was profound.

Presently dim, shadowy forms came creeping with a careful avoidance of clatter round the corners of the sheds. The sentry snored. He dreamed of a furious cyclone which descended upon him suddenly, whirled him about, and enveloped him in stifling sacks. Later it buried him remorselessly under suffocating folds of tarpaulin. This was especially the work of a huge, fat devil with hairy hands, who controlled the storm and frightened the warrior so horribly that he lay quite still, too paralysed even to wriggle.

'Got him nicely,' grinned the skipper, flushed with his labours. 'Not much buck in these conscripts. Now then, cast clear. Heave!'

The course of the cyclone was erratic. After a terrible disturbance of Government property it miraculously rearranged the disordered heap, even adjusting the coverings, before it finally blew itself tempestuously away along the quay. The brute-devil kicked the cowering sentry at parting, and uttered ghastly guttural growls. Presently a distant winch-chain rattled. A derrick creaked noisily, as if a vessel were loading into her hold. The relief of the Ninth Infantry found their comrade collapsed and incoherent. But with the dawn the *Bulwana* was steaming fast down the wide, shimmering surface of the broad estuary from the La Plata to the sea.

Three days later Ismèrie was sitting on the sunny side of the main-deck watching the amazing evolutions of Lord Railton and an apprehensive squad of seamen-gunners on the fo'c'sle. By the sheer triumph of his personality alone over their tastes and better judgment, the teacher was infusing into his pupils a certain degree of amateur smartness. Suddenly the steward shot up from below and sped frantically towards the captain's cabin under the bridge.

Loud sousing and snorting noises were audible inside, proclaiming that the skipper was performing his morning wash. The steward knocked timidly.

'Please, sir, the second engineer 'as been 'orrible sick,' he announced impressively. 'Same as the first engineer was took yesterday. 'E's groanin' fearful, an' can't keep 'is watch.' As if in confirmation, the ship was slowing down.

The news acted as an electric shock on the inmate of the cabin, who emerged, enveloped in a towel alone.

'What! another of 'em?' ejaculated the skipper, aghast. 'What did he have for breakfast?'

'Coffee an' bacon an' eggs, sir.'

'Then the eggs were musty,' opined the skipper with conviction.

'The shells smelt all right,' the steward asserted propitiatingly. 'To my mind, sir'——

'Well,' boomed the skipper as the man hesitated, 'out with your notions, you dunderheaded, black-clawed owl!'

The steward coughed behind a hand whose grubbiness had recently been strongly disapproved of by the lady-passenger as a serious disqualification for his coveted berth on shipboard. She had mentioned this more than once, and had been indignant to find her views not more fully shared.

'I don't trust'—the speaker's voice was hoarse with an unnatural attempt to be low and confidential—'that there new furrin cook, sir, from Manuel's. I b'lieves 'e 's a-pizenin' us all off.'

The skipper scrubbed his legs thoughtfully with the flapping ends of the towel. 'Send him to me,' he commanded. 'And the bo's'un too,' he added, as a precautionary afterthought.

The voyage of the *Bulwana* so far had been full of mishaps. The mate had made himself unpopular with the new deck-hands in his zealous attempts to make them work, and the engineers had introduced lamentation in the stokehole by forcible remonstrances with spanners when the firemen failed to keep up proper steam. This had happened more than once, and speed had fallen off seriously. It really seemed as if there were a conspiracy aboard to delay the ship. The skipper fumed. He had an inkling, too, of the reason. Meanwhile relations

had become strained between the bridge and the engine-room; therefore, when the engineers were taken with a mysterious sickness the captain was unsympathetic.

The cook responded to the summons with obvious reluctance. Shepherding him behind was the bo's'un, a powerfully built man of forty-five, with a solemn, hard-set face.

'You've been hocussing the engineers' coffee,' accused the captain at once with sternness.

The cook turned an absolute green. 'Me, sir! No, sir,' he stammered shakily.

The captain suddenly decided that his suspicions were correct; they bore out the truth of the girl's story. 'You are paid to see we pass the cape in daylight, eh?' questioned the skipper suavely.

The man's furtive eyes glittered. He turned wildly at bay.

'Thanks to these constant delays in the engine-room, we shall sight the cape about midday to-morrow. It is not a bad view of the shore; but you won't see it, as you'll be shut in the for'ard store-pantry. Ah, would you—you hound?'

A knife gleamed in the sunshine. Seething with suppressed rage, its owner stabbed at the captain. He splintered the door-panel instead.

The bo's'un was wondrous strong in the arm. He descended upon the cook from the rear like some grim incarnation of Fate. Producing a coil of cord, he trussed up the offender with callous adroitness. The scuffle was of the shortest. The squeezed and helpless cook was propelled without tenderness from the deck at a much greater pace than was comforting. He subsided miserably amid the ruins of empty butter-casks in the store-hole, where he made frequent mention of his orphan children and the injustice of being misunderstood.

The skipper completed his toilet in sombre gloom. The sacrifice of the cook presaged further inconveniences. A soft voice interrupted his forebodings.

'I can help with the cooking, if you like.'

''Tain't a fit job for you, miss,' said the skipper, nearly swallowing the soap in his surprise.

'If you give me a man to wash up.'

'Easy to do that,' he spluttered. 'There's Tompkins, lazy young beggar. Do him good.'

'He's very speckled about the face,' remonstrated Ismèrie, in some doubt as to this choice of an assistant.

But Tompkins's master swept this objection aside as trivial. 'I'll see he does it properly,' he assured her determinately. And later he confided to the astonished Lord Railton, after gun-drill, that Miss Marland was a plucky sight better than the 'save-me! there's a mouse' sort of girl. ''Tis a woman like that as makes the race,' he said with great emphasis. His listener concurred completely.

Twenty-four miles from the north-eastern extremity of Brazil lies Cape San Roque. A projecting point of white sand scattered over with tufts of brushwood rises some one hundred and eighty feet above high-water mark. Vessels which take the inshore channel between San Roque reefs and the mainland usually pass about two and a half miles distant from the point, and in sunshine the neighbouring red cliffs show boldly out to sea. As the *Bulwana* drew abeam the cape the captain proceeded to take observations from the bridge.

The scene was very peaceful; nothing was in sight. Save for a faint smudge of smoke hull-down on the horizon, sea and shore alike appeared deserted. The sky was fine and the air calm, and a mild breeze blew off from the land. It was ideal weather—for ballooning.

Railton sought his sweetheart in the galley. She looked singularly soft and girlish, and quite enchanting, in spite of an old dress and apron. She was hunting worriedly in a locker. No one who has not tried knows the difficulty of finding the right saucepan in a strange cook-house, especially if it is not there. She was intent on the search in a manner before unknown.

Lord Railton paused with a man's instinctive distrust of a kitchen.

The girl swung round suddenly with glowing cheeks. 'I smelt your kind of cigar,' she remarked demurely. 'Isn't it hot?'

He wiped the bashful perspiration from his forehead, and agreed. Her sleeves were rolled up to her elbows. Nobody ever had such white dimpled arms.

'I'm sure I must be looking as if I had just tumbled out of a rag-bag after a sleepless night in it,' she reflected tentatively. He reassured her consolingly.

'Isn't that boy helping you here?' inquired Lord Railton, with remembrance of the assistant.

'I found him employed on his own illicit affairs,' she laughed; 'so a chastened Tompkins is now scrubbing out a frying-pan in the scuppers for dear life. It is already cleaner than it has been for years.'

The laugh did them both good. Nerves were at high tension that morning. Railton had edged cautiously into the galley, but—despite himself—his eyes would constantly rove irresistibly landwards. He was a man who did not know what fear was, but he was conscious of a brisk, lively apprehension of what the day might have in store.

The girl twisted the hem of her apron and looked up at him with a curious questioning in her eyes. Then she put his arm back where it ought to be.

'The uncertainty *is* a bit trying,' he said gravely, ignoring her action and resolutely restoring his arm to its former position.

She chose not to notice the double meaning in the words. 'You are on my skirt,' she announced with irrelevancy. Before he could speak again interruption came, swift and stern.

'Balloon on the port bow, sir!' the strident tones of the lookout man forward rang out in brisk alarm.

On the *Bulwana's* bridge Iredale impassively replaced his sextant in its case. His lips were compressed, the lower one projecting pugnaciously. He shouted one order alone: 'All hands below deck.' Then he stepped into the wheel-house and took the helm himself.

He and Railton had carefully discussed what they should do if the emergency came. Action must be taken towards the enemy, not away from him. The climax, if unavoidable, must be faced with boldness. There was no escaping the encounter.

On the fo'c'sle-head, under a temporary canvas cover, Railton and two seamen told off for the purpose lay concealed beside the Krupp gun. The tampion was taken from the muzzle; the snip of the breech-block, as it closed on the loading shell, was muffled and unheard.

It was no mere balloon which had soared forth with swift, silent motion from one of the white sandy bays to the north of the cape, where it had remained anchored overnight, hidden amid the dark-green brushwood and the cocoa-nut trees. The opaque shadow of a magnificent dirigible airship came dancing over the sunlit sea, its pace momentarily increasing in velocity. The grim craft was poised high over the surface, like a giant bird, sinister and threatening.

Iredale watched its oncoming steadily from under cool, level brows. It was changing direction to bring itself above the steamship. He put the *Bulwana's* helm hard over, and the vessel circled on its seething wake. The airship shot past abeam.

The men in the car knew their business. Their control of the cigar-shaped monster was perfect. It wheeled deftly in a graceful curve through the atmosphere and headed back towards the ship. So close it glided that every movement of the aeronauts was visible. Uzué was managing the adjustments, manœuvring with the utmost judgment, regulating the elevation, watching the buzzing motors. Another man, gripping the cordage, hailed the *Bulwana* through a speaking-trumpet.

'Heave-to that steamer.'

'Pirates!' was Iredale's muttered response. He added a curse which, if fulfilled, would have provided completely for all contingencies in the others' future. He held on unwavering.

With accelerated speed the airship began to descend. It slid stealthily forward. The champing of its engines, the whir of its revolving fans, were clearly audible. It was essential to range vertically overhead in order to drop the gun-cotton charges.

'Thunder!' Exactly at that moment the American in the car flung down two bombs. The explosions blared in short succession. One missile hit the steamer's bow, and the fragments in their rebound plunged, hissing, into lashings of blinding spray. The other bomb fell directly on the engine-room skylight, shattering the combings and hurling havoc into the machinery. The *Bulwana* staggered under the shocks like a wounded thing. A roar of steam escaping skywards testified to the disaster below.

Iredale sprang from the wheel-house on to the rocking bridge.

'What are you waiting for?' he yelled with fiercest fury. 'Hit it now or never. Ah!'

Bang! On the fo'c'sle Railton and a sailor laboured round their smoking gun. The other man there was a ghastly, shapeless heap, staining the deck with blood.

Missed! The shell had whistled wide.

The next seconds would decide. The airship was skimming round to renewed attack, its crew astounded to find the *Bulwana* armed, but wild to annihilate both gun and gunners. Again the breech-lock of the Krupp snapped home.

Railton gripped the lanyard and waited calmly. He did not intend to miss again.

'Now!'

The suspense ended. The captain from the bridge let out a howl which he afterwards admitted might have been heard in far Honduras. Railton fired.

Shrapnel! The shell burst beautifully right between the car and the superstructure. With extraordinary rapidity Railton and the seaman flung the empty cartridge-case aside, reloaded, swung round the gun into alignment, and fired two following shots. There was no need for more. The little puffs of woolly smoke from the scattering shrapnel hung for a moment vibrating in the sunny morning air. Then they melted away. Dozens of deadly bullets tore through the flimsy tissue of the hovering airship and penetrated the reeling car. A fragment of steel hit the standing American in the face, and the sea mercifully swallowed what remained of the quivering human form. The network, rent in all directions, collapsed inert and formless, and the gas poured out in streams. The flapping and snapping were tremendous. Sluggishly at first, then quickly, the great structure bent over and shrank before the staring eyes of the *Bulwana's* crew. Then, as the envelope deflated in fantastic folds, the airship sank obliquely into the water, a miserable tangle of wreck.

The girl-spectator was white to the tips of her ears. A jagged little section of bomb had ripped open the sleeve of her blouse and grazed her small arm beneath. She never heeded the wound. She clung to Railton breathlessly, mutely feeling to see if he was safe.

'Oh John!' she gasped, and she never knew she first used his Christian name. 'I—want to cry; but I—can't;' and she sobbed unrestrainedly on his shoulder. John—Lord Railton—has that old jacket stained with his wife's blood to this day.

An excited little Scotch engineer flung himself deckwards from the lurching cylinder platform, heated and profane. 'Losh, man!' he spluttered, 'ye'll e'en observe a perfectly sinfu' mix-up wi' the gear below if ye're only superfeecially acquaint wi' engines. 'Tis a week's repair in the shops as the auld craft 'll be needin' afore she'll do another knot. A very bairn could see it the morn noo;' and the speaker danced frenziedly round the débris of his shattered skylight.

'What's yon?'

The distant trail of smoke on the horizon had resolved itself into a steam-launch coming at full speed. The water curved white from her thin-nosed bows. Suddenly she eased down; next she changed her course in panic. She had seen the end of the airship, and it dawned upon her navigator that the rendezvous was no place for him. She departed, spouting, in a hurry. Railton hastened her flurried retreat with two quite unsuccessful shots. Later the gun was hove overboard. It lies at the bottom of the South Pacific still.

The *Bulwana* arrived at New York woefully overdue. But she delivered the little, iron-bound boxes of gold intact. The consignees were gratified, and supplemented verbal appreciation in a manner so substantial that half the *Bulwana's* crew were off for a week. The captain himself was a witness at Lord Railton's wedding, attired with a gorgeousness regardless of expense.

For, as the *Bulwana* steamed through the narrows at Sandy Hook, her two passengers settled their future.

'Do you really care so much?' Ismèrie queried with averted head.

Lord Railton tried to peer beneath the wide straw hat.

An exquisite colour was mounting in her oval cheeks, and the small mouth quivered, uncertain if it ought to smile. 'The past is worse than ever now,' she murmured. 'I—I've been a cook!'

He did not contradict her.

For a second she flashed a fleeting glance at his eager eyes. Her own shone, dilated like two violet-tinted jewels. 'Haven't you done with my hand?' she demanded of a sudden.

Then, indeed, he spoke. 'The hand is mine for always, sweetheart, now. And I shall never let it go.'

'That will be very awkward,' sighed Miss Marland. However, she nestled even closer to him with resignation.

'You have saved our lives,' he told her. 'The past will rise beside us—to make us love the more.'

THE END.

KROOBOYS.

NOT very long ago public attention was directed to the subject of the supply of cheap native labour in South Africa suitable for working in the mines of the Rand. As all the world knows, the supply was said to fall considerably short of the demand, with the result that other sources outside the continent had to be drawn upon. In view of this, it may be interesting to glance at another part of Africa which suffers to a certain extent from the same shortage.

The West African colonies and dependencies, less known—perhaps because less advertised—than the southern portion of the continent, are certainly of not minor importance, from a commercial point of view at any rate; for not only do they export enormous quantities of rubber and palm-oil, both articles that modern civilisation has made indispensable and necessary, but numerous other products scarcely less valuable. As is probably well known, the unhealthiness of the climate of the West Coast makes it impossible for Europeans to do any kind of manual labour, and the Crown colonies of West Africa are hardly ever likely to become suitable for white settlers in the same manner as Australia or Canada.

It would surprise the average Englishman to know that the western littoral of Africa is remarkably well-off in the matter of shipping services; as, besides a large fleet of steamers sailing from Liverpool, there is a German line of equal importance running from Hamburg—with which place, by the way, a large West African trade is done—as well as two French, one Portuguese, and a Belgian line, all owning fast and commodious mail-steamers; to say nothing of occasional vessels flying the Spanish flag that ply between Barcelona and Fernando Po.

The lack of suitable and sheltered harbours is perhaps almost as much a drawback to the development of West Africa as the evil reputation of its climate. On account of the high salaries paid to white men and the many additional expenses attendant on their employment, commercial enterprise would come to a standstill unless cheap native labour of some sort was procurable. To what source, then, do the numerous mercantile firms and shipping companies look to obtain their supply of labourers and crews? Practically, the one and only place has been, till lately, the Kroo Coast, in the negro republic of Liberia. The natives of this part of the world are known as Krooboys; and though the name may be familiar to many people through books of travel and even novels, yet their habits and undoubted value as an asset in the labour-market of West Africa are unknown except to those whose misfortune it has been to come into actual contact with them.

As one passes down the coast after leaving Sierra Leone, the steamer generally comes to a halt off various little clusters of native huts half-hidden among the tall palms that grow down to the very water's edge, and in response to three sharp toots of the siren various frail-looking canoes can be observed paddling quickly from the shore. On near approach it will be seen that they are crammed with half-naked negroes clad in the most ridiculous odds and ends of European garments. After a vigorous and heated parley between the occupants of the canoes and the captain of the ship, the bulk of the natives swarm up the side of the steamer that is to bear them to their various destinations and masters at ports down the coast. This constitutes the 'recruiting,' and, I think, compares favourably with the 'blackbirding' of Kanakas that was for so long a scandal to Australia.

On their arrival at the place to which they are 'consigned,' the agent of the firm or steamship company signs them on in much the same way as sailors sign articles before a voyage. A year is invariably the length of their period of service; at the expiration of which they return to 'we country,' as they call it, to enjoy their hard-earned gains, until poverty again drives them out to work for the white man. I believe that if, by any chance, they refuse to return within twelve months they become pariahs, and thenceforth their country knows them no more. Should any of the boys be new to dealings with the Europeans, they are immediately christened by the agent or steamer captain. It is hard for an Englishman to keep a straight face when for the first time he calls the muster-roll of a gang of Krooboys, and has to shout out the ridiculous names that are always bestowed on these men. Bottle Beer, Big Belly, Frypan, are a few samples; but I think the gem of the lot was Work-for-nothing, which one strapping black I knew answered to.

When I first went to the West Coast I never found much trouble in getting the twenty odd boys I had under me in the yard to muster and respond to their names; the difficulty came in two minutes later, when I had ticked the last name off and raised my eyes from the book to set them to their various tasks (for there was always plenty to do, especially in the early part of the mornings). Only half-a-dozen or so would then be visible, the rest having mysteriously disappeared. Of course they had to be followed and routed out of their various hiding-places, when they generally gave some such excuse as 'Me go drink water.' It is very seldom that you see your whole gang at work, as it is impossible to be in a dozen different places at once, and there are always some skulkers or absentees; for what Krooboys do not know about 'pointing,' as it is called in Australia, is not worth knowing. Naturally, they always try to play tricks of this sort on a newcomer; but once you let them see you do not intend to be trifled with, matters will go more smoothly. Many men never attain any success in working natives, especially those who cannot command their own tempers.

Every gang has a 'headman,' through whom you give your orders; and a lot depends on this gentleman, who is a very important person indeed. Should he be a good one, who takes pride in his work, he will see that the rest do not loaf; but should he be otherwise your lot is indeed an unhappy one, for his authority exceeds yours. Another thing noticeable with Krooboys—and, in fact, with most West African natives—is that an assistant-agent or any white man in a subordinate position can seldom hope to exact that implicit obedience which they give to a person in full authority, no matter how much the former may make his personality felt. They are quick to discern the difference between 'big massa' and 'small massa,' as they call them. The latter title always used to jar on me very much.

Recognising their value to the white man, they have come to have an altogether exaggerated idea of their own importance. Certainly they are cheap. A pound a month is the wage of a first-class boy, and on a steamer at working a winch or stowing cargo in the hold they are unrivalled, and their capabilities in regard to paddling the huge surf-boats through the breakers are little short of marvellous. The steamer captains, however, are careful to keep all the biggest and best boys for their own crews, and generally the factories get only the residue of 'weeds' and loafers. They are also greatly in demand as personal or house stewards on account of their smart appearance and cleanly habits, as well as their knowledge of English, which generally exceeds that of other West African natives. Pick an intelligent boy out of your yard-gang for a steward, and though he may at the time be more or less dirty and grimy from the nature of his work, in two or three hours he will appear thoroughly washed and clad in completely new clothing, conspicuous among which is a *lappa* (or waist-cloth) of brightly coloured cotton—nearly always worn as the badge of office of a house-boy—ready to wait at your table, and proud of his promotion. 'New brooms sweep clean,' and for the first few days your house and clothes will be thoroughly overhauled—which state of things, however, will die down in time unless you have been fortunate enough to get hold of an exceptionally good steward. When sent on messages they are very apt to linger and seize the occasion to pay calls on their friends, a mode of procedure which is sometimes rather annoying. As cooks they can hardly be termed a success. The only white man I knew who made an experiment in this direction was so frequently ill, or else went hungry, from the weird dishes put before him, that he was at length forced to make a change in his culinary department.

Do not let the reader imagine that only full-grown men are in the gangs. Small boys, or rather children, often accompany their elders on a trip to the white man's country; and very useful these

little imps can be. It is really wonderful how quickly they pick up English, besides half-a-dozen native languages; their own dialect being used exclusively among themselves. I never yet heard of any white man or native of any other tribe who had even a slight knowledge of the Kroo tongue; indeed, they are very chary of letting an outsider into the mysteries of the clicks and guttural monosyllables that form their language. I have known a small boy who told us the meaning of two or three words get a severe rating from his headman. The universal language used in dealing with Krooboys is 'coast English,' a sort of 'pidgin' dialect which takes some little time to master properly, and until it is learnt one is in a very uncomfortable predicament, as it is the sole means of communication with your household and outdoor servants. My curses on the man who invented and first taught it to the unsuspecting nigger, whom surely it would have been as easy to teach proper English. If it were only strange words the difficulty would be small; but there is such a queer jumble of twisted phrases and such distorted meanings to ordinary words that the new-comer is naturally apt to become a little mixed. For instance, if a Krooboy wanted to say that So-and-so was dead, he would observe that 'he live for die,' or if So-and-so was in the house 'he live for house,' if outside 'he live for out.' However, it is no use grumbling, as this is the recognised form of speech all over the West Coast, in all the *foreign* as well as British colonies. Awkward as it is for an Englishman to master, what must it be for a German or Frenchman? Many Germans have told me how difficult it is for them to learn correct English when they come to the coast, as they are so apt to get confused with this base dialect.

At Lagos, where I spent some years, there are hundreds of Krooboys employed by the numerous branch-steamers plying in and out of the lagoon, as well as by the factories. Gangs of them walk up and down the Marina, as the chief thoroughfare is called, all night, making the evenings hideous with their loud and uncouth conversation. I have often thought that the compound system in vogue in South Africa might be introduced on the coast with advantage.

Krooboys are of a happy-go-lucky disposition, and very similar in temperament as well as appearance to Kaffirs. A friend of mine once observed that the former were the 'Irishmen of the negro races.' In addition to their meagre wages of from ten to twenty shillings a month, they are generally paid sixpence or ninepence a week 'chop money,' and out of this handsome allowance they grow fat and often actually save money, and things are by no means too cheap on the coast. One German house I knew dispensed with this cash payment, and gave their boys either a cupful or half a cup of rice daily, the difference of ration being accounted for by the receiver's lifting capacity. A simple expedient this: 'Supposing you be fit carry one bag kernels, you get 'em one cup rice; supposing you no be fit, get 'em half-cup.' They were quite content; indeed, the love of rice is almost a passion with them. Though fairly honest as a rule, they can never be trusted near a bag of this stuff; which seems to me strange, as anything I had as an article of diet at meal-times would hardly appeal to my predaceous instincts, though perhaps it is merely a sign of foresight on their part.

It is curious that, out of the scores of different negro tribes living all down the four thousand miles of the West African coast, nearly all should be either so conservative in their ideas or have such an intense dislike to work directly for the white people that one tiny strip of land constitutes the only available recruiting-ground for labourers. It is not that the other black races are lazy; certain individuals may be, but there are none like the Krooboys, who take so readily to and are so quick to learn the innovations and inventions of modern shipping. I do not know for certain whether they have been tried at plantation-work; but I think I have heard it said that they are or would be a failure at anything of that kind. Why I cannot say, as they must live by agriculture in their own country. If the experiment has not been made, it is certainly worthy of consideration.

Though they are met with as far down as Swakopmund, in German South-West Africa, there is one place that nothing will induce Krooboys to have anything to do with, and that is the Congo. I remember well an English steamer belonging to the British and African line going from Lagos to put in a year's service as branch-boat on the Congo River, with a crew of Krooboys on board, who, on learning their destination a few days after they had been at sea, made such a fuss that the steamer had to put back to Lagos and discharge them. Evidently the somewhat arbitrary methods that the Belgians have of dealing with recalcitrant natives does not appeal to the independent spirit of the Krooboy.

The quantity of luggage Krooboys will take on their return to their own country is marvellous. As a rule, when they arrive at the beginning of their period of service there is hardly sixpence-worth of property among a whole gang; but as the months go by they are continually buying cheap tin trunks, or else constructing wooden chests in their spare time, and these, painted and carefully corded, make quite an imposing show on the wharf or beach just previous to their departure for home. Even the smallest boy, eight or nine years of age, has his two or three bundles or boxes. One may ask, what do their treasures consist of? These are lengths of cheap cotton prints, brass pans, and large cooking-pots; but the chief ambition that animates the breast of every Krooboy is to possess a tall hat—if possible half-a-dozen, but at least one! I remember the firm I represented importing a large case of old, second-hand silk hats, which were retailed

at five shillings and sixpence each; and so great was the demand by the yard-boys that the whole consignment was sold out in less than ten minutes. Many must have spent the hard-earned savings of months on these treasures, and two or three stragglers who came too late to obtain any actually wept bitter tears of disappointment. What they do with all the things they take home I do not know, but I have heard that they 'present' the bulk to their king or chief; in fact, it is a kind of toll or custom-duty that the latter potentate levies on his dusky subjects. I once had the pleasure (and honour) of seeing a letter from the king of Sasstown to my principal — written in very fair English, too—in which his Majesty expressed a naïve desire that my chief would make him many valuable presents, in which case he (the king) would send the former a gang of 'very good boys fit for plenty hard work.' This important document was signed 'King Billy' in a straggling, schoolboy hand; and it has always been a matter of regret that I did not ask for and obtain this precious epistle, as one does not get the chance of seeing the correspondence of royalty every day.

There are several towns or villages on the Kroo Coast, each of which boasts its own chief; certain districts being noted for skilled surf-boat boys, while others have a superior reputation for the industry of their inhabitants. It is curious how little is known of the domestic life of these people; and during all the time I was on the coast I only saw one Kroo woman, and she was hardly what one would call a Venus. Though nominally under the rule of Liberia, they have a huge contempt for the comic opera government and officials of the negro republic; in fact, they look with disdain upon all other black people, and their contempt is only equalled by that of the latter, who class Krooboys as 'bushmen,' the lowest epithet in the coast English dialect.

Short as are the stoppages which steamers make when embarking a gang of boys off the Liberian coast, they are as nothing compared with the stoppages when they are taking returning labourers home. In the latter case it is seldom that a vessel does more than slow down, and the boys have to clamber over the side and get their baggage down into the tiny canoes alongside as best and as speedily as they can. Often the mate, bursting with impatience, will throw their boxes overboard into the water, there to sink or swim according to their contents, a proceeding which never fails to induce the owners to follow with very little delay. Still, there is really no excuse for this drastic method, as the steamship companies make a good thing annually out of the passage-money of Krooboys, and the latter have a right to be treated as passengers.

Whether Krooboys would appear to advantage as labourers in the Rand mines is a difficult question to answer. Personally I think they would, as they are generally of good physique and have a natural aptitude for hammer-work; but the insufficiency of their numbers, the expense of bringing them down, and their certain refusal to absent themselves from their own country for a longer period than twelve months would all constitute serious drawbacks. Besides, their emigration to South Africa would undoubtedly be strongly opposed by the many influential West African houses.

There is another and darker side to the Krooboy's character, of which, however, having had no personal experience, I can only speak from hearsay. Vessels wrecked on the dangerous Kroo Coast have been quickly looted by the inhabitants, who are by no means so mild and gentle of temperament in their native land as a casual acquaintance with them at work on steamers and in factory-yards would lead the stranger to believe. Dark tales are told from time to time of castaway passengers and white crews being murdered for the sake of their possessions, of fingers cut off living hands for the rings on them, and other like stories—all, however, more or less authenticated—showing that, though these people have availed themselves of some of the advantages of our civilisation, there is still a good deal of the savage left in them.

WOODLAND VOICES.

THROUGH the woodland faint voices are calling—
Sweet songs of a summer day;
Through the valley the streamlet is singing
As she hastes on her seaward way!

Fancy is throned in the branches
Of a grim, twisted, aged oak-tree;
She sings to the woodland enchanted,
And calls in her joy to me:

'Dear heart, the woodland is calling,
And whispers I hear in the air;
The fairies are asking a playmate
The foxgloves to twine in your hair!'

High up in the fern-covered cavern,
Where the waterfall leaps on his way,
I see the gray eyes of sweet Echo
Peeping forth from a mist-cloud of spray.

She calls to her sister, fair Fancy,
And beckons with white hands to me;
Anon, as the vale-mist comes creeping,
She sings to me—dreamily:

'Ah, child of the woodland, my loved one!
List, ere the night-shades do fall:
Hold in your eyes Fancy's message,
Keep in your heart Echo's call!'

I rise from my dream in the valley
At the close of the summer day;
The woodland voices are silent,
For Echo has passed away.

GRANDFATHERS' CLOCKS.

By HARWOOD BRIERLEY.

THE revival of old oak furniture and grandfathers' clocks appears to be giving great satisfaction in high places. It has to be admitted that there is a real charm accompanied by not a little art tone about these useful heirlooms which, for some time past, have been cherished more at the farmsteads than the mansions. But now we shall find that in many good houses the grandfathers' clock has been transferred from the kitchen, or brought down from a dusky corner on the stair-landing, to a more conspicuous and honourable position near the entrance. When specimens by reputed good makers are put up by auction at country house and cottage sales the bidding for them is often keen. Pertinacious dealers are scouring the country-side in quest of old oak furniture and clocks, thinking to tempt their owners with offers of cash down.

The broker and the dealer in antiques often know a thing or two about enhancing the market-price of these clocks at a very little cost. The other day a sheep-grazier and his wife were tempted to part with what had been a most cherished possession for generations; and, although they needed the money badly, they both repented their decision when the cart came to fetch it away. This dame, shedding tears into her apron, informed me that when the clock came into the house-place from her old home not long after she was married there were quite twelve inches too much of its stature; so that, rather than cut a hole in the wood ceiling, John took up a flag and dug down into the foundations, planting the clock's base there. It so happened that when the grand finial had been bent forward a little this family possession was, to all intents and purposes, let into the house. But now, alas! the clock had gone away for ever; and what would Joe, their eldest son—a railway porter at Newcastle—say about it? Instead of the family heirloom she could only show him a half-crown metal clock, with alarum, which reigned in its stead.

Everybody who possesses a grandfather-clock is glad of some particulars as to its age, the maker's fame and place of residence, &c. For amongst the *lares* and *penates* of our country households the tall eight-day clock, with its deliberate, solemn, and incessant *tick-tock*, easily holds first 'pride of place.' In all probability it belonged not to one grandfather only, but to many in succession, for which reason it is bound to be a cherished possession in its own old corner. The market-valuer or broker would insult the owner by unsentimental calculations as to its worth in the form of a 'going concern.' Surely, nothing in furniture-form so clearly accentuates the blessings of home as the old clock with its measured *tick-tock*. Nothing so admirably sustains for lifetime after lifetime that peaceful, old-world, domestic atmosphere which one read about in the story-books of a bygone generation. Eloquent of passing time, while its revolving lunar dial warns the shepherd or encourages the farmer, the living clock is such a good-natured giant (often eight feet of stature!) that in many country places to-day it receives the attention of a Christian. Its long case has for a century or two been polished with elbow-grease on an application of beeswax and turpentine, possessing now a brilliance and a density of colour that cannot be obtained by twentieth-century patent mixtures guaranteed to save time and strength. It talks to the whole house in two notes which might be called monotone, and may be relied upon to discuss the hours with unwearying patience for a period indefinite, asking but the one solitary favour that some member of the household will stand on a chair to try the physical exercise of winding it up on preparation-day, after everything else has been put in order for the Sabbath.

One would like to see a picture of Longfellow's 'Old Clock on the Stairs.' Were dragons carved on its door-panel, as though to frighten away those persons who had no right to look inside? Was there on the dial a motto of the monitory kind about the passage of time, the danger of delay, the

 [*All Rights Reserved.*]

virtue of punctuality? Thomas Lister, a famous Halifax maker, pasted inside his clocks a sheet on which was printed a Quaker-like reminder of the rapid flight and proper use of time, as follows:

> Lo! here I stand by thee upright
> To give thee warning day and night;
> For every tick that I do give
> Cuts short the time thou hast to live.
> Therefore, a warning take by me,
> To serve thy God as I serve thee;
> Each day and night be on thy guard,
> And thou shalt have a just reward.

And what a medley of subjects used to be introduced on those dials of pierced brass and enamel! Old Father Time, for instance, with his staff and possibly sickle; ladies spinning with distaff and spindle; shepherds and satyrs piping to naked nymphs; winged and rosebud-mouthed Cupids, and birds listening to lovers in the pleasaunce; dolphins disporting in the sea with mermaids; masks of Saracens and ogres; and who can say what? The clock-head usually had fluted pillars with capitals, or twisted pillars without, while in the spandrels above there was often some arabesque marquetry. The cresting might consist of scrolls turned towards the centre, or it might take the form of a spread-eagle, or a spire, or brass ball finials. There might also be a lunar dial revolving to the moon's phases, and a date-wheel. I always imagine that 'The Old Clock on the Stairs' which inspired Longfellow's poem must have been a very handsome production, though not of English workmanship. Long may it 'strike home' to the hearts of English readers! Thus:

> Somewhat back from the village street
> Stands the old-fashioned country-seat,
> Across its ancient portico
> Tall poplar-trees their shadows throw,
> And from its station in the hall
> An ancient timepiece says to all—
> 'For ever—never!
> Never—for ever!'
>
> Half-way up the stairs it stands,
> And points and beckons with its hands
> From its case of massive oak;
> Like a monk who, under his cloak,
> Crosses himself and sighs, alas!
> With sorrowful voice to all who pass—
> 'For ever—never!
> Never—for ever!'
>
> By day its voice is low and light,
> But in the silent dead of night
> (Distant as a passing footstep's fall)
> It echoes along the vacant hall,
> Along the ceiling, along the floor,
> And seems to say at each chamber door,
> 'For ever—never!
> Never—for ever!'

Longfellow goes on to show that 'The Old Clock on the Stairs' has seen many changes—'days of sorrow, days of mirth;' an increasing family, the nursery with its prattle, the golden hours of youth, love-making scenes and weddings, not a little feasting, and the closing scene of death. The sentient clock, watching these temporalities with solemn face, replies thus to the question if those who have gone hence shall meet again:

> 'Never here—for ever there!
> For ever here—but never there!'

Let us now leave the poetic aspect of grandfathers' clocks, and come to a few facts which may prove useful. We may say that no thirty-hour, eight-day, and three-hundred-and-sixty-five-day time-indicators of this type now exist which are older than 1640. Those which went for one year without winding up were made between 1670 and 1770, but are now very rare indeed. A hundred and fifty years ago they appear to have been made in most of the country towns in England, and in very many of the villages. Needless to say, they were not turned out wholesale at a rapid rate by machinery, and at the least possible cost, for ready sale in every available market. Nowadays the world is crowded with producers and reproducers; we have too few craftsmen such as have thriven both before and since the days of trades guilds. The old clocks bore the marks of conscientious labour, loving care, for it was intended that they should wear for a couple of hundred or three hundred years, and so pass into the category of family heirlooms. Zachary Taylor, Emmanuel Easton, Humphrey Clark, Anthony Gamble, Thomas Lister, J. Farrah, T. Pierce—a few old clockmakers' names I have met with—had nothing to do with modern German, Yankee, or Brummagem methods. No cumbrous plant had they, no spacious workshop to put it in, no glaring shop-front for display, no advertisement in newspaper, almanac, or directory. Some of them were too conscientious in their methods to 'make money;' but that was at a time when families were less extravagant than they are to-day, and when *bona-fide* hand-made goods were not imitated by machinery.

Let us take a peep at the methods of these old-time clockmakers, who were, I doubt not, often droll fellows who went about their business single-handedly and never worked 'against time.' Some of them had small workshops; others were quite content beside a bench and foot-lathe in the house-place, where they had occasionally to suffer a scolding for being in the way or making unnecessary dirt on washing or baking days. Usually they had to buy the material for their movements—that is, the clock-works—from the brassfounders. This they cut, shaped, turned, and polished in the foot-lathe. Pointers, pinions, pivots, escapements, wheels, and other parts were all carefully made by hand, the process being a tedious one with the limited tools at hand. Wheel-teeth had all to be filed out in a vice, and afterwards hardened and tempered by some simple but effective process. Such a worker would not hesitate to spend half a week over a single steel finger, and consider his time well spent, as indeed

it was, seeing that for a few centuries it would be the observed of all observers, constituting the most obviously important part of the clock and no unimportant factor in the household arrangements. Some of the large pointers resemble a long, thin rapier in miniature, with twisted hilt and pierced handle; while the lesser fingers often take the shape of mediæval scissors. It was probably the habit of each old clockmaker to adhere to his own favourite pattern. I should say that from 1670 to about 1750 many clocks had only one pointer, and in some cases only one weight.

A proud possessor of a tall clock who finds a personal name engraved on the dial, followed by the name of the town, naturally concludes that it came from there. However, confusion may be worse confounded by the dial and the works bearing different names. It was customary at first for the name engraved on the dial to be that of the owner, not of the maker, though afterwards it became necessary for the maker's name and place of residence to appear. It is never safe to conclude that the man who engraved the dial fashioned also the movements and the oak case. As a rule, there were three separate departments in the trade. Possibly the best guide to a clock's age is the size of the dial or face, which the maker of the movements got engraved to order or purchased ready-made, this being an independent art. We must remember that the first dials made (*circa* 1675) were of brass, and that they did not measure more than ten inches square; but the size went on increasing until, at the close of the seventeenth century, they were fourteen or fifteen inches square. One hundred years later (in 1780) enamelled dials, white or cream-coloured, with fancy paintings on them, first appeared, and were much cheaper than engraved brass. Although a century ago a few Birmingham firms were specialising on clock pinions, dials, watch and clock hands, &c., there was no such thing as a 'clock-case maker' to the trade. Village cabinetmakers charged about fifteen shillings for an ordinary case of well-seasoned oak. The tops of the doors were cut square or straight, their carving and rounding-off being an embellishment which came into vogue after 1720. Mahogany cases, with more or less marquetry or inlay-work, are of more recent date than oak; those boasting Oriental or Japanese lacquer being attributed to about 1745. A couple of young persons would, in olden days, as soon think of setting up housekeeping without a seven or eight pound clock as without a four-poster and feather-bed. Owners of clocks of the type first mentioned may be comforted by the information that they were made before the days of trade directories, of which the earliest one worthy of note appears to be *The Universal British Directory* for 1790–95. Britten's list gives only members of the Clockmakers' Company, so that, unless recourse be had to parish burial registers, there is little or no clue to those ancient worthies who quietly prosecuted their calling without charter.

Finally, what was the cause of the decline of this cottage industry? Less cumbrous but much inferior clocks, designed to 'take up less room,' were made and sold at 'no cost worth mentioning'! New style jostled against newer style as America, Coventry, Birmingham, and Germany overstocked the market with competitive wares. By-and-by the world's workers began to argue that if they could buy a clock with an alarum for less than five shillings, why should they spend eight sovereigns on one without an alarum? My story is told, and I cannot at present call to mind a single town or village where a grandfather's clock has been made these forty years.

CASIMIR LE SOMBRE.

CHAPTER V.

A FEW days after my conversation with Deotima I was sitting alone, when Father Ambrose, a Franciscan monk who officiated as chaplain at the castle, approached me, and, regarding me fixedly with his searching black eyes, said:

'My daughter, Countess Czartoryska tells me that she has made you a sharer in all our plans and hopes. It is a heavy load for young shoulders to bear. Do you feel sure that you can bear it without flinching?'

'I can, Father,' I replied, returning his gaze firmly. 'What one woman can do I will do.'

'These are proud words to come from the lips of a girl who but yesterday was a child,' he said gravely; 'and yet women, and young women, too—for were not Joan of Arc and the Maid of Saragossa young?—have done much that is great in the world's history. Youth is the season of confidence, and confidence is the means of success.'

This last reflection he had made more to himself than to me; but now assuming a practical tone, he continued:

'You know that all engaged in this undertaking are exposed to great danger, and it may be well for you to be provided with a disguise. Your father made you wear male attire, did he not? Make yourself a suit now—I give you the Church's permission; but let no one know that you possess such a dress, and perhaps one day it may prove your greatest safeguard, for I must leave this place soon, and shall be absent some months. Adieu, daughter! My blessing be with you.'

I will not dwell on the events of that winter or the feverish state of excitement in which we lived. So vigilant were the Russians, and so numerous their spies, that our hopes of success depended almost entirely on the efforts of friends from without. Recruiting agents were busy among the exiled Poles abroad, and it was arranged that these were to assemble in Austrian and Prussian territory, where they were sure to add to their numbers, and then cross the frontier in small parties to form rallying-points where the Russian Poles could join them, and boldly throw down the gauntlet of insurrection. The German troops, of course, patrolled the frontier and did all in their power to frustrate this plan; but, notwithstanding, large numbers of young men flocked to the standard of the National Government, and, eluding every obstacle, managed to throw themselves across and attack the Russian outposts with varying success.

We in the meanwhile were not idle. It was necessary that stores of ammunition and food should be secreted in the forests for the use of the *powstancy—nasy powstancy* (our insurgents), as we loved to call them—should they penetrate to our neighbourhood; and many a day, when taking Zampa for a gallop in the forest, have I carried cartridges secreted about me to one of these hiding-places.

At last a day came when the Count decided to join his fortunes openly with the insurgents; and, collecting all the young men whose loyalty to the cause could be depended on, he started to unite his forces with a company of *powstancy* which was reported to have crossed the frontier near Czenstchow, under the command of the Countess's only brother Ladislas.

You can imagine how terribly empty the great house looked when they were all gone, and Deotima and myself, with Karl the old major-domo and a few waiting-women, alone remained behind.

The Count had thought it wise to take all his men-servants with him, for he knew that some were pretty sure to be in the pay of the Russian Government, and he wished to prevent their telling tales till he was strong enough to resist pursuit.

The news we received of the insurgent forces was now most uncertain. Sometimes we only heard of them through a foreign newspaper smuggled across the frontier in the greasy cap or boots of one of the Jewish pedlars who drove a rich trade as go-betweens; sometimes a trusty peasant would arrive with a message which it was not safe to put into writing. The only news that *never* seemed to miscarry, and that always travelled fast, was that telling of death or disaster. Late in February we heard how nearly a thousand of the flower of the Polish youth had lost their lives in a desperate attempt to surprise the Russian garrison of Michow; again, in March, how our insurgent general Czechowiski had been driven back across the frontier after two days' stubborn fighting with the enemy. But in April more joyful tidings came, and we heard that Jeziaranski had been smuggled into Russia in a farmer's cart, and was rapidly concentrating a force of insurgents to engage the Imperial troops. The Count was reported to be with him, and our excitement was of the most painful kind; but heavy rains had now fallen, and the country was so flooded with water that for a time we were cut off from all news.

CHAPTER VI.

THE sun rose faintly through a watery sky on the 13th of May 1863. That day was the turning-point in my life, but I knew it not. Deotima and I followed our usual round of occupations, and in the evening we retired to the library, where, however, she no longer had the heart to play on the organ, the soft, tender tones of which touched her feelings too deeply. Suddenly there was a clatter of a horse's hoofs in the yard and a sound of footsteps in the passage. Our hearts stood still, the door flew open, and old Karl came in almost supporting in his arms a tall, gaunt figure dressed in a Polish tunic and high boots, which dragged his steps painfully as if severely hurt. round his head was a blood-stained rag, and his left arm hung powerless by his side.

'Lady,' he said in a husky voice, 'I bring you a letter;' and he would have sunk to the ground but for old Karl's arm. I hastened to pour out a glass of spirits, and held it to his lips, while Deotima tore the letter open. It was in the hand writing of a well-known friend of the cause, and ran as follows: 'Your brother is in great danger. He is encamped with three hundred men on the right bank of the Warta, near the black morass. One thousand five hundred Russians are on their way to surprise him; and if you would save him, send on a message with a fresh horse to give warning. The enemy will be upon him by daybreak to-morrow.—Yours, D.'

'And my husband, where is he?' she asked breathlessly of the messenger, whom the brandy had slightly revived.

'*Boguchwala!* [Praise God!] he is safe with Jeziaranski.'

'When did you get this letter?'

'At daybreak; but I was pursued by Cossacks and obliged to leave the road. I have been wounded in two places.'

Great though her anxiety was, Deotima's first care was to see that the poor fellow was properly tended; then she returned to the library and burst into an agony of tears.

'What can I do?' she cried piteously, appealing to me. 'We have no man that we can trust but old Karl, and he does not know the forest, even if he were strong enough to ride forty miles before daybreak. Oh, my poor Ladislas, my brother, I shall never see you again!'

It was in vain that I tried to comfort her; there was in truth but little comfort to offer, and the very effort she had bravely made to control her feelings during the past anxious months caused the reaction now to be all the stronger. Indeed, her grief became so hysterical that I thought it best to make her go to bed; and after giving her a sleeping-draught I remained watching by her side till her sobs and moans gradually subsided, and I saw that she had sunk into a peaceful slumber. Then I took a lamp and stole to my room.

A half-defined scheme which had formed itself in my mind at the spectacle of Deotima's distress leaped into sudden shape when my eyes rested on my father's sabre and pistols hanging over the fireplace. Why should I not save her brother? Would the veteran of Napoleon's wars who wore that sabre have thought twice what to do under such circumstances? And why should I, his child, hesitate now? I knew every glade of the forest, and no horse could do the distance with greater speed than Zampa. There was little time to lose, and I gave myself no time to think.

Locked away in my wardrobe lay the male disguise which, in accordance with the advice of Father Ambrose, I had secretly prepared: the round astrakhan cap (for which I had worked a badge displaying the national White Eagle), a dark-gray cloth tunic braided with black, loose overalls to match, long boots reaching to the knees obtained from a Jewish pedlar, and a capacious cavalry cloak, lined with scarlet, that had belonged to my father.

Hastily divesting myself of my evening-dress, I donned these garments; and as I buckled on my father's sabre and surveyed myself in the glass I thought I might well pass for a young Polish officer. There were many in our national army who could number fewer years than I, and my tall figure and somewhat dark complexion were all in my favour. One thing remained to be done. I had long black hair reaching below my waist, and this I must sacrifice. Seizing a pair of scissors, I cut it short—not, I must confess, without a sigh of regret; then I sat down at the table and wrote a line to Deotima telling her to fret no more, as I myself would deliver her message. After I had sealed this, my next care was carefully to load my father's pistols, and sticking them in my belt, I wrapped my cloak around me and crept cautiously down the gaunt moonlit staircase.

Not a light was visible in the house as I crossed the yard that led to the stables. Zampa began to stamp and rattle his chains when he heard the door open, but a word from me quieted him, and I soon had the bit between his teeth.

There were several men's saddles in the harness-room, the lightest of which I selected, and, girthing it firmly on his back, led him into the open. I had often ridden astride when I was a boy—or rather a girl in boy's clothes—and now when the noble animal felt the grip of my knees on his flanks he seemed to know that some special display of energy was required of him, and, shaking his mane proudly, dashed at a hand-gallop into the dark shadows of the forest.

(To be continued.)

LIVING BATTERIES.

By F. G. Aflalo.

WE smaller dwellers on the surface of an earth which we have inherited after the elimination of gigantic reptiles that would have fed on us, have reason to be thankful that the dangerous power of administering the electric shock from natural batteries is mercifully restricted to a few fishes that are nowhere abundant and always easily avoided. An electric elephant would be a terrible foe to encounter, but how much more appalling than even the tse-tse would be an electric fly! There would be no escape from so small and so mobile a scourge; but those who deliberately and of set purpose seek out the few fishes endowed with this mysterious power have only themselves to thank if knowledge brings sorrow. From one only—the torpedo or electric ray, known to our fishermen as the 'cramp-fish'—does man run any risk in the performance of his ordinary duties; and the torpedo, besides being of retiring habits, cannot be regarded as a common fish in British seas.

The appearance of the torpedo, which is first cousin to the sharks, gives us the secret of its murderous methods when seeking what it may devour. It does not roar, for voice is given to but few fishes. Its strength is in its silence and stillness, for it is all but undistinguishable from the sand on which it lies. Other rays and skates possess the electric fluid in a minor degree; but the torpedo alone has a reputation to live up to. Its electric organs are honeycombed with hundreds of cells filled with transparent jelly, and a shock is given only on contact at two points. It is a fish of great size, and has been caught in our seas weighing upwards of eighty pounds. It is not a sprinter—few fishes, indeed, are more deliberate in their movements; yet, gifted with the power to paralyse at touch, it is so terrible a foe that it can afford to lie perfectly still and deal out death without an effort. Indeed, it is easy to see from the small size of its teeth what little need the torpedo has, like so many predatory fishes, to seize slippery prey. There is no escape for a victim once struck insensible

by a dose from its terrible accumulators. Most of its deadly work is done at night, as has been proved by careful experiment with a flash-lamp in the aquarium, and throughout the day captive individuals are seen to keep their eyes half-closed with the sleepy expression characteristic of nocturnal animals.

The French naturalist Dubois published an interesting fact which establishes beyond a doubt the torpedo's knowledge of its own strength. Like many other sharks and rays, it bears living young, and he noticed repeatedly that pregnant females used their electric power freely; but as soon as the young were born, and consequently liable to the same risk as anything else swimming in the tank, they forbore from bringing the batteries into play. This observation is interesting also on psychological grounds, for it clearly indicates parental instinct in a very primitive group of fishes.

Better known, at any rate in books, than our torpedo is the electric eel (or gymnotus) of the swamps of Guiana and Brazil. For many years visitors to the Zoological Gardens at Regent's Park were fascinated by the electric eels kept in a tank in the tropical climate of the Insect House, on the north bank of the Canal, and it was a matter of arrangement with the keeper to experience the sensation of a mild shock. This was never severe, as it is probable that their powers never developed very highly in the conditions of captivity. In its natural surroundings, the electric eel, being more active, is still more formidable than the torpedo.

It grows to a length of about six feet, and is capable of stunning animals of considerable size when they resort to its haunts for drinking purposes. Travellers have related that its batteries can even stun the dreaded alligator, and we know from the Indian method of capturing it for food (a much-appreciated dish among the native tribes) that it can paralyse horses. These unfortunate animals are driven into the swamp, and the eels, terrified and enraged by the intrusion of stampeding hoofs, glide alongside their unwelcome and unwilling visitors, and discharge their electric stores again and again into the bodies of the horses. The panic-stricken horses dash madly up the bank, only to be driven back among the living batteries in the water until they sink exhausted in the ooze, and the now exhausted eels can be impaled with impunity on grains or harpoons fastened to dry lines, by the use of which the Indians run no risk from any electricity that may be left unused.

The battery of gymnotus lies in an arrangement of cells above and beneath the tail, and the electricity is positive on the upper surface and negative on the lower. Its remarkable power was clearly not given to it for the destruction of horses. The repulse of the omnivorous alligator is a more likely purpose, but the main object is doubtless the procuring of food. It has been suggested, though without very satisfactory evidence, that it can even paralyse small fishes at some distance; but such wireless attack is scarcely necessary, since its dull and inconspicuous colouring must enable it to lurk unseen in the muddy water of those Brazilian marshes and to stun any fish that comes in contact with its tail. To devour the fish before it recovers consciousness is a question only of appetite.

This electric property, though commonly associated only with the ray and eel, has been remarked by naturalists in other forms in both fresh water and salt. In the rivers of the Nile region, for example, there is a cat-fish with muscular electric organs bearing close resemblance to those which we find in the torpedo; but in this case the battery extends the entire length of the body. On the Atlantic seaboard of North America, also, there is a star-gazer which can give electric shocks from a bare space on the upper side of the head. It is, indeed, not improbable that the growing investigation of the fishes of the sea will reveal hitherto unsuspected electric properties in other kinds, for it is hardly likely that so specialised a weapon of offence and defence should have been developed in so few; there are, as a matter of fact, signs of atrophied electric organs in several groups of fresh-water fishes in Africa. One feature of this strange power has so far been found common to all that are endowed with it: like the venom in snakes, the electric force is easily exhausted, and can be renewed only with food and repose, a process of recuperation which we may perhaps compare with the doctoring of a galvanic battery with fresh acid.

THE GOLD-GHOST.

By ALBERT DORRINGTON, late of Queensland and New South Wales.

THE world had not seemed so empty until the solitary sandhill swung into view. Nothing moved or stirred within the belt of mangrove and ti-tree swamp. A network of creeks gridironed the rotting blue mud-flats.

Trooper Buckland walked his horse through the perilous growth of knife-like thorns that sprouted everywhere between the heaps of stone. Behind, leading another horse, came a narrow-hipped black tracker wearing the uniform of the Queensland mounted police.

The sandhill attracted Trooper Buckland; its queer, camel-like formation suggested the work of man and the proximity of a mining-camp. The young trooper was one of a party sent out to ascertain the whereabouts of Frank E.

Donnolly, gold-stealer and aboriginal 'disperser,' wanted on a charge of shooting and ill-treating certain members of the Arunti tribe camped on the Gascoyne River. The small white population scattered between Batavia River and the Gascoyne forgave Donnolly his recent attack on the gold-escort at Emu Creek; it was the hunting and 'dispersing' of inoffensive bands of aboriginals that caused every man's rifle to be turned against him.

The trooper approached the sand-heap cautiously, while the tracker crept sleuth-like in his shadow. A pig-tailed head and face appeared suddenly from a near ti-tree clump, and for a moment the white man observed a pair of slant eyes measuring him inquisitively.

Buckland laughed easily. 'Good-day, John,' he shouted. 'Come out and show yourself.' The look of unspeakable terror in the Mongolian's eyes amused him. Dismounting, he threw his bridle-rein to the tracker, and stepped to the sand-heap leisurely. 'Blacks been annoying you?' he inquired briefly.

The Chinaman crawled from his hiding-place, eying trooper and tracker uncertainly. His dungaree pants flapped weirdly about his bulging knees; his sludge-smeared hands and feet spoke of recent labours within some shallow mine or creek-bed. 'Wha' fo' you come here?' he asked in a high-pitched voice. 'Evelyting bad; evelyting got um devil but me.' Squatting on a heap of tailings, he wrung his hands and wept shrilly, like one bereft of kith and kin.

Buckland climbed the sandheap, and discovered a deep excavation at the other side. A windlass with a rope attached stood over it. The shaft-like excavation descended about fifteen feet to where a tunnel had been driven towards the creek-bank. The unmistakable drip, drip of water was the only sound that came from the ill-constructed little mine.

The trooper regarded the weeping Chinaman curiously, and listened to his hysterical outpourings of grief and rage against some unknown power which had recently deprived him of two fellow-countrymen, partners in the mine.

From his babblings Buckland gathered that a certain mystery hung about the fate of the two missing Chinese gold-seekers. Three mornings before, the leader of the party had descended the shaft with pickaxe and bucket to bring to the surface some of the rich quartz left in the tunnel the previous night. The clink, clink of his pickaxe had been heard by the two Chinamen in charge of the windlass, and as the morning wore on he came to the tunnel-mouth and asked them to haul up the bucket of specimens he had dug from a pocket in the roof.

His companions had waited near the windlass for his return with the bucket. The sound of his footsteps in the tunnel had reached them, followed by the clatter of the pickaxe falling against the stone-covered floor. Then came a shout and a long, wailing cry for help, accompanied by a flail-like thrashing as though a body was being bumped against the wall of the drive. That was all.

Both Chinamen had waited until the following day, hoping that their comrade would appear once more. Min Ying, the younger of the two, then volunteered to go in search of him. Descending by the windlass-rope, he entered the tunnel cautiously, calling out the name of their missing friend. There was no reply. It may have been the glitter of the gold-filled bucket that carried Min Ying far into the tunnel. A strange clapping noise followed his entry, a sharp cry, and then silence. What did it mean?

At the conclusion of his story the Chinaman rocked to and fro on the sandheap, his sludge-covered hands gripping his knees as each wave of hysteria swept over him. 'What you think happen to my comlades?' he asked suddenly. 'Two welly careful men. No whisky dlink; no opium pipe. Welly hard workers. They go down an' I see um no moah.'

Buckland, followed by the black tracker, walked round the mine curiously, half-suspecting the Chinaman's story. From what he gathered he was certain that the tunnel had been driven a hundred feet or more in a northerly direction. Good gold had been found, and he was not inclined to believe that two Chinamen would run away or play hide-and-seek with a paying concern.

The history of the North Queensland goldfields taught him that certain diggers were in the habit of spreading false reports concerning their ghost-haunted mines, especially when their claims had a reputation for producing big dividends. In many instances the ghost-theory kept gangs of inquisitive loafers from exploiting the workings after midnight when the camp was asleep. He was also aware that in the matter of raising a ghost-scare the crafty Chinaman had no equal.

Buckland was not eager to test the validity of the story. He was concerned chiefly with the whereabouts of Frank Donnolly, the man who had shot five natives at the head of the Gascoyne River only a month before.

At a sign from Buckland the tracker led the horses some distance along the creek, where the blue grass stood over their fetlocks. Hobbling them securely, he returned to the mine to await fresh orders from the trooper.

Buckland smoked unconcernedly near the windlass, peering from time to time into the shaft, as though listening to the sighing of the wind in the tunnel. It occurred to him that the mine had an outlet leading to the creek. A sudden thought fired him. Taking his carbine from its case, he beckoned the Chinaman sharply.

'I'm going to peep into your haunted mine, John. Stand by the windlass; my black boy will give you a hand to lower me.' Making a loop at the end of the rope, he seated himself in it securely,

adding a few words of caution to the nimble-witted tracker.

The windlass creaked and rattled as they lowered him into the mine. Buckland, seated in the loop, nursed his carbine as though ready to cover the first object that moved from the throat of the drive.

Slipping from his seat, he stepped to the tunnel-mouth and glanced inside, his left hand shading his eyes from the sun-rays that streamed down the shaft.

A great stillness hung about the deserted mine. The wind sighed and fluted through the long, quartz-lined corridor; the sound of water dripping from the gold-studded roof above made strange music in the half-terrifying silence.

Buckland stooped for a moment as though his alert eye had caught the dazzling glitter of the specimen-filled bucket at the end of the tunnel. A couple of steps took him inside, the muzzle of his carbine level with his hips. Water dripped on his head and hands. A strange musky odour stayed in his throat like poison. Creeping forward half a pace, he halted at sight of a pair of swinish eyes watching him from the end of the tunnel. A soft, almost imperceptible, breathing noise followed, as though a huge slimy shape were moving towards him.

Returning to the windlass-rope, he signalled to the men above. Swiftly and silently he was drawn to the surface, a grim smile on his sun-tanned face.

'You see um devil all li!' gasped the Chinaman, as the trooper climbed from the sling. 'Wha' fo' he no' kille you?'

'Your devil happens to be an old-man alligator,' laughed Buckland. 'Am afraid I can't arrest him either.'

The Chinaman's jaw fell; his eyes rolled like bits of metal in their sockets. Rushing to the mouth of the shaft, he commenced to hurl down pieces of quartz and stone until the tunnel echoed under the furious bombardment.

'Hi yah, you cassima brute! Why you eat Willy Sing an' Min Ying? By cli, I kille you byemby! You come out heah!'

'He'll attend to you if you go down, John,' grinned the trooper. 'Seems to me your friends bored through the reef to the edge of the mangrove-swamp and made a passage for the alligator. There are scores of them along the creek.'

'Why you no' shoot him?' cried the excited Mongolian. 'You go down an' give him one bullet quick. Him no' eat any moah Chinaman then.'

'I'm not commissioned to shoot alligators,' retorted the trooper gravely. 'Leastways, I'm not going into a pit to shoot one.'

'Wha' fo' you come heah, then? You Government trooper; you protect um me from alligator.'

'You haven't a miner's right, to begin with. And if you start fussing about your alligator I'll throw a certificate of confiscation at your mine. That wouldn't be nice, seeing the amount of good gold in sight—eh, John?'

The Chinaman shuffled away, whimpering inaudibly as he prepared a fire and food for the hungry trooper and black tracker.

The day was insufferably hot; the western sky seemed to pulse in waves of fierce browns and reds. Swarms of whistling duck and pigmy geese crowded the reed-choked lagoons and flats. Far away in the dim, mangrove-skirted east a small herd of Gulf buffaloes wandered through the rank sword-grass and swamp-oaks. An endless vista of spinifex and salt-pans filled the west. Clouds of big brown flies floated in from swamp and flat, driving the sun-weary trooper to the shelter of the Chinaman's hut.

During the hot afternoon the tracker wandered to the edge of the spinifex, kneeling at times to scan the earth's surface where some scarce visible impressions showed the trail of a moloch lizard or passing emu.

Buckland dozed inside the hut, his carbine resting on the beef-cask at his elbow. During the last sixteen hours he had remained in the saddle while his assistant tracker had explored the surrounding plains and swamps. Buckland, like most northern troopers, felt that better work would be accomplished after the horses had been fed and rested.

The tracker returned from the spinifex occasionally, pausing with knee and chin to the earth as though listening to some new sound which disturbed the pulsating tranquillity of the wilds. Half-crawling to the hut, he grunted a word through the open door that brought Buckland outside, carbine in hand. Dropping to his knees, the trooper crawled beside the tracker towards the shelter of the mangroves, where the horses were feeding in the lush blue grass.

'Somebody coming,' he called back to the amazed Chinaman. 'A white man. Don't say we're here, or I'll confiscate your mine. Savvy?'

The Chinaman gaped from the shaft-head and nodded dully; his bewildered eyes searched the distant spinifex for a glimpse of a man's outline.

It seemed hours before the faintest sound broke the hot stillness. The drip, drip of water in the tunnel, the soft fluting of the wind in the deserted shaft, played on the Chinaman's pent-up nerves. Staggering into the open at last, he beheld a mounted figure riding towards the mine.

At sight of the new-comer's face the Chinaman's knees and hands trembled violently. Retreating towards the shaft, he turned abruptly, licking his dry lips. 'Why you come heah, Donnolly?' he gasped. 'You go way plenty quick, or me fetch um policeman.'

'No, you won't, Wong,' guffawed the other, dismounting smartly. 'Don't talk police to me, or I'll bend your spine with a gun-barrel.'

In European countries Donnolly would have passed for a wild man. Twenty years spent in the

jungles of North Queensland among Chinese fossickers and aboriginals had stunted his mind and lowered his caste. His long, gorilla-like arms hung inertly at his sides, save when he swung his rifle lazily to his shoulder. As he walked his glance leaped from bush to bush with criminal stealth, as though fearing a bullet at every stride.

He regarded the Chinaman morosely, and his sun-wrinkled eyes wandered to the shaft and windlass. 'Where are your mates,' he snapped—'Min Ying an' the other leper? They were both here larst week.'

Hereat Wong Chat hurled the story of death and mystery at the sullen-jawed gold-robber with ferocious embellishments, omitting all reference to the live saurian camped within the tunnel of the mine. With the faith of his kind, he clung to his devil-theory until a broad saturnine grin overspread Donnolly's face.

'That'll do.' He strode to the mouth of the shaft, and glanced below sharply, and then at the Mongolian cowering in his shadow. 'Seem to be making your pile here,' he said bitingly. 'You sent eighty ounces to the bank at Port Darwin in December, an' another parcel last month. Where's your clean-up for February?' His white teeth were visible through the rift in his beard, and his eyes glinted maliciously. 'Been plantin' it, I s'pose, an' weavin' a blamed ghost-story round it.'

'One big hollible devil,' chattered the Celestial. 'Him bite um like um wood-saw; him swallow um gold-bucket.'

'He ain't the only devil that likes gold,' grunted Donnolly. 'Reckon he's welcome to the bucket if he's as big a liar as you. See here'—the gold-robber wagged a thick forefinger at the Chinaman menacingly—'I'll give you twenty seconds to shin down that shaft an' sling your dust to the surface. D'ye hear?'

Wong Chat fell to the earth and clutched the robber's knees desperately. 'You killee me; I no' go down there. No, no. Devil get um me. You shoot um me first.'

Donnolly's fingers played about the breech of his rifle undecidedly. His swift eye wandered up and down the mangrove-skirted inlet, and back to the silent spinifex from whence he had come.

There was little to be gained by shooting a hysterical Chinaman who might, for all he knew, hold the secret of much hidden treasure. He paused for a moment, his foot on the sand-heap, while his dish-faced camp-horse nibbled the grass near by.

His inquisitive eyes noted the sling at the end of the windlass rope; he beckoned the trembling Wong Chat.

'I'm goin' to look at this devil that swallows your buckets of gold. Just hold the windlass-handle an' lower away. An' while you're about it, don't forget that my rifle is quicker than your hand.'

Thrusting his legs into the sling, he nodded darkly, his rifle gripped in his big hairy hands. Wong Chat clung to the windlass-handle fearfully as he lowered the hawk-eyed mine-robber into the shaft. His mouth twitched strangely when Donnolly reached the gold-pitted floor of the mine; leaning over the shaft, he stared down gaping and irresolute.

'That'll do.' Donnolly glanced upward, and the hot sunlight illumined his gorilla-shaped outline. 'Don't leave that windlass-handle; don't move a toe or finger till you hear from me.'

'Me welly flightened!' stammered Wong Chat. 'You shake my feelings up an' down—you—you'——

The mine-robber snarled him into silence. Turning towards the tunnel, his expert eyes drank in the narrow vista of gold-veined reef that sloped and bulged from the great schist-like formation above. He was now certain that the Chinaman had invented the devil-story to frighten him away. Entering the tunnel, he was caught by the dull gleam of water-washed gold that fretted its low roof and walls. The eternal dripping of moisture from above had exposed the beautiful seams of precious metal that crossed and criss-crossed like the veins of a human hand. Here and there the gold-pitted roof had been timbered and stayed to prevent it from caving in at the centre.

Donnolly gaped incredulously at the rich, specimen-studded walls, and the criminal sweat broke from his face and throat. With his bushman's knife he picked and scraped the walls in his futile haste to strip them of their bulging knobs of gold.

'To think,' he choked, 'that this Morgan of a mine has been held by three bleatin' chows, an' nobody in the Gulf any the wiser! There's nothin' to prevent me cleanin' up the place an' runnin' over to 'Frisco. I'll make the chow live down here until he's scratched out every bit of colour from the workin's.'

A soft, thrashing sound caught his ear and sent him hastily to the mouth of the tunnel. Looking up, he saw that the rope had been drawn beyond his reach. The Chinaman still leaned against the windlass gaping listlessly in his direction.

Donnolly glanced half-suspiciously into the tunnel, listening intently. Above the dripping of water came a greasy, choking little noise, followed by a slavering sound that seemed to run through the narrow-walled drive.

The sound drew nearer until the white-lipped man saw the huge, shovel-shaped snout of the Gulf alligator nuzzling the earth in front. The swinish eyes seemed to blink as they emerged into the angle of fierce sunlight.

The snout approached him shyly at first, inch by inch; the long, barrel-shaped body scarcely seeming to move. With his back against the wall of the excavation the mine-robber watched it, half-fascinated, his limbs drawn stiffly, scarce daring to breathe.

'Let down that rope, Wong Chat!' Without moving his eyes from the shovel-shaped head, he

bellowed his words up the shaft. 'D' ye hear? Let down that rope.'

The snout regarded him curiously; the great length of body seemed to throb like an engine within the narrow tunnel. It advanced and stopped with incredible swiftness, and the small lids blinked incessantly over the fish-like eyes.

'Lower that rope!' The mine-robber's baying voice echoed throughout the tunnel, but his body did not move by the fraction of an inch. 'That rope! D' ye hear?'

Wong Chat peered into the shaft and gaped; a sudden grin illumined his inscrutable features. He made no response.

With unwavering eyes Donnolly stared at the saurian's head, the huge, flail-like body that smote the earth with trip-hammer force.

Swift as a lizard it rushed out open-jawed, nimble as a python, and in that moment the white-faced man tasted the fetid, musky breath that blew about his nostrils with petrifying insistence.

Snap! snap! The man leaped across the circular space with the agility of a trapped lion, and fired at the blinking, up-slanting eyes. The bullet glanced from the impenetrable ridge of bone, as, with a series of trip-hammer blows, the brute sought to pin him against the smooth sides of the shaft. Penned within a twelve-foot circle, surrounded by an unscalable wall, the saurian moved not so craftily as the Gulf-bred desperado. Thrusting his rifle into the red, blinking eye, he fired and leaped aside.

The explosion seemed to rend the roof of the tunnel; the saurian's head remained in the air for a moment, its jaws wide apart, while a deadly hiccup passed through its body. With a glance at the flinching throat and lifeless carcass, Donnolly glared at the windlass above.

'I'll give you a chance to lower that rope, you slant-eyed mongrel! Are you listening?'

The Chinaman's head vanished suddenly; and as Donnolly moved to the centre of the excavation he saw the rim of a carbine-barrel peeping at him from beyond the windlass.

'What's that? What'—— he demanded hoarsely.

'Sorry to disturb you, Donnolly.' The peak of the trooper's cap showed beyond the pointed carbine. 'Keep where you are and kindly let me have that gun of yours.'

The mine-robber hunched his big shoulders wickedly; his unloaded rifle almost fell from his trembling hands. 'Who are you?' he stormed. 'Show yourself.'

'Send up your rifle, Donnolly, butt first, please, or I'll pile you on top of that dead 'gator.'

The windlass-rope was lowered until it touched the mine-robber's chest. For one desperate moment he hesitated before placing his weapon in the running noose at the end. 'Nice trap to set for a man!' He regarded the scarce visible trooper with blazing eyes. 'What kind of a circus do you call this?'

The rifle was drawn up swiftly, and the rope lowered again without words. Buckland now appeared at the mouth of the shaft and bade him ascend. Wong Chat and the black tracker drew him slowly to the surface; the trooper's carbine covered him as he stepped from the sling.

'Keep your hands well up,' warned Buckland grimly. 'I don't want any of your rushing, garrotting tactics. Now'—he glanced swiftly at the black tracker—'lower them.'

The aboriginal sprang forward and snapped a pair of handcuffs over the sun-blackened wrists. 'You no shoot any more black fellar, Donnolly,' he said quietly. 'Mine think it you forget me.' He glanced into the prisoner's eyes.

The mine-robber regarded him closely for a moment. 'You're the dog that tracked me from the Gascoyne River, I s'pose. Guess I've no memory for a black fellow's face.'

'Baal you shoot um mine mother an' sister one long time ago. Me only piccaninny then. One time ago at Emu Creek.'

'Remember shootin' a camp full of black thieves down there years ago,' grunted Donnolly. He stared long and fixedly at the tall, bright-eyed tracker. 'You ain't that darned squallin' brat I let go, the one that clawed my boot an' cried for its mammy?' he said at last.

'He's the brat,' broke in Buckland. 'From the day he could crawl he promised to track you down. He followed you from the Gascoyne to the Roper and back to the Gulf,' the trooper laughed carelessly, 'and here we are at last.'

'You needn't have sooled that alligator on to me, anyhow,' grinned Donnolly. 'He might have bit me, an' that's ag'in' the law.'

'Mine thinkit allumgator better dead than bite 'em you, Don'ly.' The tracker stood erect, smiling in the captive's face.

'Yah! you ungrateful beggar; this comes of sparin' piccaninnies 'cause they cry at your boots. Next time I'm loose I clear out all the niggers from Darwin to the Murchison,' he growled.

'Baal you'll be loose on um scaffold soon,' half-whispered the aboriginal, 'through um trap-door, mine think it.'

Two hours later a small procession moved from the mine and crossed the flat to where the sun was spreading a coppery nimbus over the illimitable cotton-bush and spinifex. The black tracker led the way; Donnolly, securely strapped to his own horse, followed; while Buckland rode ten yards in the rear, his carbine resting across his saddle-front, his eyes scanning the sand-blighted track ahead.

The Chinaman followed them a little way, imploring the trooper not to leave him alone with his haunted gold-mine. Donnolly turned in the saddle and shook his handcuffs at the chattering Mongolian. 'I'll come back one of these days an' pay you for that alligator.' Then turning to Buckland, he grinned wickedly. 'S'pose you

ain't goin' to leave the gold-mine for long. Like most colonial policemen, you'll find a use for it.'

'Some of that gold may help to support one or two of the little hospitals around Port Darwin,' answered Buckland cheerfully. 'It may help to clothe and comfort a few of the fatherless piccaninnies who owe their poverty to you and your gun, Donnolly. I'll see that Wong Chat's little mine pays a tribute, you may trust me,' he added fervently.

The Chinaman halted on a sandhill and watched them ride far into the spinifex. The black tracker rode ahead, his face luminous with joy, like one who had satisfied the spirits of his long-departed dead.

JUSTICE FOR THE TIGER.

TO put the case in a few words, the tiger is not nearly so black as popular tradition paints him. He has suffered and does suffer from the unfortunate fact that his misdeeds afford more sensational reading than the narrative of his good deeds, in which he does not stand alone; and such prominence is given his crimes that his virtues have been well-nigh overlooked altogether. Perhaps the statement that the average tiger is not only a harmless but a useful member of Indian society is so new and strange, so subversive of accepted belief, as to be incredible. It is difficult—nay, impossible—to prove his merit by figures; but we can, at any rate, relieve the species of the stigma attaching to it by reference to official statistics, and, it may be, do something towards rendering him elementary justice.

It will not be easy to obtain a fair hearing for the tiger. Officially, he heads the list of bad characters. For generations he has been among the wild beasts upon whose heads, or skins—for an economical administration claims the tiger's skin from his slayer—a reward is set. Forty rupees (worth one shilling and fourpence each) are paid for any tiger, twenty for a leopard or wolf, and ten for a bear. The system of paying rewards was adopted on the assumption that every tiger, leopard, wolf, and bear is undesirable; the assumption is far more generally true of the three last than of the first, but official classifications are generally rather sweeping, and in the case of the tiger there is grave injustice. In his case the crimes of the few are visited upon the many, Government being oblivious to the really valuable services the vast majority of tigers render to the Indian cultivator—services unsullied by wrong-doing or even by intimidation. We can convict the supreme Government of gross injustice to the tiger out of its own publications.

According to the census of 1901, the population of British India, including Burma and Assam, numbered nearly two hundred and thirty-two millions. The population of Hindustan increases very slowly, and the figures of 1901 may be used to represent the population of the present day; it is probably a little larger, but we will make out the worst case we can for the tiger by taking the census of seven years ago as our basis. Every year the Indian Government publishes a Return of Mortality from Snakes and Wild Beasts. In 1905 the number of persons killed by tigers was seven hundred and eighty-six: this is about the average; but it is sometimes much exceeded, as was the case in 1900, when the total—nine hundred and forty-three—was the subject of official comment as unusually high. True to our object of making out the worst case against the tiger, we will assume the average number of deaths laid at the door of the man-eater to be eight hundred and fifty per year; and this gives the proportion of persons killed by tigers as one in every two hundred and seventy-three thousand of population. Remarking parenthetically that the death of one person in about ten thousand is annually attributed to poisonous snakes, we resume the indictment against the tiger. It is important to bear in mind that the eight hundred and fifty deaths do not represent eight hundred and fifty man-eaters. The tiger or tigress—for the worst man-eater is often a female that abandons pursuit of cattle and game to prey upon man—appears to acquire knowledge that its own life will be sought, and develops a degree of cunning which makes it peculiarly difficult to destroy; and, evading pursuit, it may be, for months, continues its career of manslaughter. Thus a single tiger sometimes contributes a formidable proportion of the death-roll; such was the terrible Ambadhona tigress killed in January 1905, to which was attributed no fewer than forty-eight deaths in the Sambalpore district of the Central Provinces. This certainly was an exceptional case; but many a man-eater has escaped its doom until it has exceeded the death-roll of the Kodakambam tiger in the Madras Presidency, which killed twelve persons before it was shot in 1893.

A single death laid to account of a tiger brands it a man-eater and singles it out for destruction; but, inasmuch as natives are few who will undertake pursuit of one with a bad reputation, and overworked European officials cannot always devote themselves to the congenial task of shooting it, the man-eater generally has time to establish its name before the campaign is undertaken. When it is undertaken, success is by no means assured. The pursuer may be versed in the habits of the species, and find willing helpers in the village; but he must spend days on the spot acquainting himself with the methods of this particular animal, whose wari-

ness increases with every victim. If the ryot could be induced to stifle his natural feelings and leave undisturbed the remains of the fellow-villager who has fallen, the European's task would be much simplified, and many lives would be saved; but this he can rarely be persuaded to do; and as the man-eater disdains cattle till goaded by hunger, the devices that succeed with the ordinary tiger fail with the man-slayer. Hence any man-eater usually has a number of deaths against him before he is destroyed. If we put the average at six we shall not overstate the case; and this gives us about one hundred and forty tigers as accountable for each annual tale of deaths. The bounty system furnishes means of ascertaining the number of dangerous wild beasts killed every year; rewards are claimed on between one thousand three hundred and one thousand five hundred tigers; from which we are justified of the conclusion that only about 10 per cent. of those destroyed are man-eaters.

So far we have been dealing only with the case for the prosecution, and it must be conceded that the species suffers heavily for the crimes of individuals. The vast majority of tigers are harmless, if not useful. The tiger that preys on game does not enter into the life of the ryot at all; he affects the most secluded retreat in the jungles and is never seen of man unless by chance. There is another and more civilised class of tiger. He takes up his quarters in the neighbourhood of a village and lives upon stolen cattle and the wild animals which always haunt the jungles bordering on cultivated land. This tiger is known to the black man, and is regarded by him with the indulgent contempt born of understanding; he is much more afraid of the man than the man is of him. The tiger is never a great traveller; he establishes himself in one district, and if left undisturbed does not, unless in the pairing season, wander beyond the fairly well-defined and limited area he has adopted as his hunting-ground. Thus he is known; and so long as he refrains from man-killing his presence is accepted as an incident of daily life. The habits of such a tiger are distinguished by the regularity that distinguishes those of the game-tiger. He lies up during the day and starts on his rounds in the evening, taking much the same route, visiting the grazing-ground and the drinking-place, which he surveys cautiously from the shelter of the jungle. If cattle are feeding he lies in wait, always under cover, on the chance of pouncing upon the cow or calf that may stray near his hiding-place. A young and inexperienced tiger may overcome his dislike to exposing himself in the open by daylight, and attack the herd; but Indian cattle, whether milch kine, draught bullocks, or buffaloes, are well able to take care of themselves. The instant the tiger is seen every head goes up, and the herd takes order to receive him—old to the front, flank to flank, young safely in the rear, and they wait. It is a very bold or very inexperienced tiger that dare face that array of lowered horns. Buffaloes do not give him the chance; advancing at their clumsy trot or clumsier gallop in close formation, they will charge him at once, and he does not await the onslaught. The village tiger's method is to wait, under cover, in the hope that some cow or calf may stray near his hiding-place. This is most likely to happen when the herdsman begins to urge his charge homeward at dusk; then the beasts string out, and one may chance to turn aside and pick at the greener herbage always to be found in the shade. Our tiger leaves his hiding-place, and, always under cover, keeps abreast of the herd, watching for this opportunity. But there is still the ryot with which to reckon, and the tiger has an instinctive respect for man. I have known two cases in which a tiger was turned in his advance on a straying beast by a naked Burmese boy under twelve years of age, who screamed and hurled clods of earth at him; and in a third case a tiger was hunted ignominiously back to cover by a girl who had no better weapon than a stick. No wonder the native regards the village tiger with contempt!

When luck is against the tiger on the grazing-ground he must look elsewhere for a meal; and if the crops are above ground he has not far to go. Affecting, as he does, a limited area of country, he knows every yard of it; and, the cattle having been driven home to the village, he seeks another dinner. Now it is that his rôle changes from that of ryot's foe to ryot's friend. Slinking by devious ways through the undergrowth, he chooses a new hiding-place on the edge of the jungle overlooking the cultivated land. The brief twilight is past, and already the ryot is squatting on the rickety wooden platform in the midst of the field, sucking at his 'hubble-bubble,' stick and tin can, or it may be some ancient firearm, at hand to make night hideous in defence of the growing crop. No fencing within his means will exclude the pig and deer, and he must do as his fathers have done if he would live. A family party of sambur or smaller deer does mischief; but their depredations are trivial by comparison with the havoc wrought by a sounder of wild swine. Sugar-cane, wheat, paddy, millet, it is all one to the wild pig, who eats his incredible fill and tramples what he does not eat. With the fall of night the ryot begins his orgy of clamour, sparing not his voice. Pausing for breath, he hears the rustle he dreads: pig, a dozen or twenty, are in the field; then sudden silence, the rush of heavy bodies through the crop as the sounder scatters, and the shriek that tells the tiger has killed. The cultivator may lay aside his weapons of discord for the night and sleep or smoke the 'hubble-bubble' in peace; the tiger has scared away the crop-thieves more effectually than all the men with all the old kerosene-cans in the district. When the crops are carried in and the fields offer no temptation to pig and deer, they offer none to the tiger, who then turns his attention to the village cattle-pen. Its mud wall offers no obstacle to him; on the contrary,

it affords valuable help. Thanks to those three or four feet of sun-baked bricks, he can creep close up, glide over, and strike down his quarry before the startled kine can form up to receive him. The pariah dogs are awake, it is true; but they, with the large discretion of their kind, retired to the other end of the village at his approach, to bark in safety. The tiger kills his cow or calf, and half-carries, half-drags it away, careless of the pariah chorus. Rarely does the ryot think it worth while to hold night-ward over the cattle-pen—a fact indicative of the value he sets respectively upon kine and crop. If he does keep watch, it is because a leopard, not a tiger, visits his beasts. The tiger kills his one beef, and is done with it; the leopard will kill for the sake of killing, and leave half-a-dozen carcasses to betray the work as his; and the ryot hates him accordingly. While the tiger confines himself to an occasional cow or calf, and it is the young beast that most commonly falls into his clutches, the villager has no particular desire to help any one else to earn forty rupees by killing him. Little of the reward would come his way; and, weighing the services rendered him in the uneven warfare he wages in defence of the crops which stand between him and starvation, he prefers the tiger alive to the tiger dead. Of course, if the district officer or policeman on tour appears, and deems it his duty to kill the tiger, there can be no demur. 'It is the order,' says the headman; and, convinced against his own vague convictions that the white man's judgment is right, the villager turns out cheerfully to beat the jungle and share riotously in the rejoicings if the tiger falls. The white man is pleased, and the white man is Government; and the Government being pleased, the ryot is pleased to have pleased him. Pleasure revolves in a virtuous circle. When the white man has gone his way, it transpires that one lucky man stole the whiskers from the drying skin, and another cut a certain bone from the breast of the carcass; and pleasure is prolonged, these things having mysterious virtues. True, the tiger is gone and with him a fount of daily interest; but if the crops are off the ground he will not be much missed, and ere next season another may take his place.

It is from the rank and file of village-haunting tigers that the occasional man-eater is recruited. There is reason to believe that the man-eater is the product of sudden impulse, of unsought opportunity. Not unseldom he proves to be a young animal, which suggests that he has discovered early in life that natives offer an easy prey. This lends colour to the theory that man-killing is hereditary. The tigress keeps her cub with her until he is at least two years old and can fend for himself; hence, if she happens to be a man-slayer, it is exceedingly probable that her offspring will acquire her habit.

As regards old man-eaters, it is easy to understand how quickly the lesson that man is dangerous, if taught, is unlearned. Some feeble and unwary old man or woman, stooping to gather simples in the jungle at the cool of evening, offers the opportunity. A gliding rush, a blow, a bite, and the thing is done. We may imagine the amazement of the slayer at the ease with which the feat was achieved. A calf struggles; a cow makes use of her horns; the boar inflicts no despicable punishment with his tusks before he succumbs; the deer is often hard to catch. The human prey gave no trouble whatever; he uttered a choking scream. And this was the enemy the tiger had been taught to respect! Shall we marvel that, having taken man's life once, he should renounce cattle and pig save under stress, and make man-eating his profession? Were the tiger less cowardly, Indian village-life would be one round of terror year in, year out. One murder stamps the tiger a man-eater, to be reported by messenger travelling hot-foot to the nearest police-station, whence the news will be sent to the nearest white man, official or planter. Meantime the crops grow unwatched, and a dozen men replace the lad who drove the cattle out to graze. Another man, overtaken by dark, is struck down within bow-shot of the village, and a group of trembling messengers speed to the police-station. The man-eater grows bolder. A woman gone to wash clothes at the well does not return; the cotton rags she carried are there, and splashed with blood. The scare is established; the cattle remain in the pen, and none but the boldest venture abroad even at noon, and they in company. Will the white man never come? The European in India, official or otherwise, has little time to spare for interludes like this; and the village is fortunate if he appear before the man-eater has won proscription in the *Gazette*, with a special reward of five hundred rupees on his head.

Such is the animal whose crimes are visited upon his kind. The rarity of his occurrence has been shown from official figures, and it must be allowed that the average tiger has ground for complaint. If any and every tiger varied pursuit of game and cattle by man-eating when opportunity served, there would be no case for the defence; but the line of distinction between jungle and village haunting tigers on the one hand and the man-eater on the other is sharp and unmistakable; and those respectable members of tiger society who remain on the right side of the line more than atone for their errors as cattle-lifters by the good they do in keeping pig and deer off the crops. In the interests of the cultivator—who does not eat beef, and therefore regards his herd as far less important than his field of grain—the character of each tiger should be considered, and no inducement given to destroy the animal who respects human life. The jungle-tiger does his share in Nature's economy by keeping down the numbers of animals who would invade the fields; but his doings, as already said, are without the ken of man as a rule.

The tiger has real cause of complaint. He might fairly ask why he should be branded as an outlaw regardless of personal character, while the wild elephant is not only allowed to roam free but is rigorously protected on pain of a fine of five hundred rupees. Time was when protection was necessary, for elephants were hunted unsparingly for ivory; but during nearly forty years of absolute protection they have greatly increased in numbers and also in the daring born of immunity. They are terribly destructive to crops, frequently enter jungle hamlets and wreck the granaries where grain is stored, and will turn upon the people who attempt to drive them off. The deaths attributed to wild elephants number twenty-five or thirty every year; in 1899 the total rose to sixty-eight. True, an elephant who has established an evil reputation may be slain by anybody; but the plundering elephant is a beast of uncertain temper, and may kill under any circumstances; he does not make a profession of man-slaughter like the rare man-eating tiger, and he pursues his career of mischief at the villagers' expense. His value, caught, tamed, and used as a beast of burden or draught, remains; but this has diminished not a little during recent years. The spread of railways and roads in India has done something to oust him from employment, and *kheddah* operations to catch him in numbers are not conducted so assiduously as they used to be, fewer elephants being required. Nobody would think of urging the indiscriminate slaughter of the elephant; but more latitude seems desirable in dealing with the overbold and mischievous of the species, even as indulgence should be shown the blameless and useful among tigers.

CONCERNING ALOES.

By ALGERNON WARREN.

IT is more than sixty years ago since the famous 'Bon Gaultier' ballad made its original appearance in the pages of *Tait's Edinburgh Magazine*, promptly gaining a well-deserved and lasting popularity. The skit was a happy one; for still, as was the case then, exists the 'pill-puffer,' who nowadays seems no whit indisposed to plagiarise from this source, and maintain likewise of his particular globules that—

> *These* put to flight all human ills,
> *These* conquer death—unfailing pills!

The result is that there is a tendency to tar all proprietary-pill manufacturers and vendors with the same brush, and dub them quacks. But now and then out will come a book of the travels of an African explorer or sportsman, who pays an undoubtedly sincere and grateful tribute to the efficacy of some maker's pill, which he considers has saved his life; and then other concocters boom their products more enthusiastically than ever, with the result that the quack unblushingly parades his wares, to the detriment of the honest pharmacist who does understand what he is selling and whom his sales are likely to benefit.

Two pill ingredients which are readily available for the charlatan, no Poison Act obstructing his purchase (the case is otherwise when he would fain play tricks with corrosive sublimate or calomel) are rhubarb and aloes. He makes use of both, but ordinarily inclines largely to the latter, as its more violent action naturally predisposes him thereto. So, alike in form of pill and potion, he misuses this valuable medicament, abusing its use as a tonic and cathartic, and injuring numbers of the credulous who listen to his blatant asseverations. The stock-in-trade of an itinerant pill-vendor involves no heavy outlay. A few shillings will cover the purchase of enough liquorice powder, hard soap, myrrh, syrup, and aloes to provide him with it, for he is not habitually fastidious about purchasing nothing but the best qualities obtainable. When a customer asks for aloes (it is not retailed much in simple form) over the counter of a respectable pharmacist he is ordinarily served with the article designated 'Socotrine,' which commands the highest price on market, and is used in divers preparations of the *British Pharmacopœia*, such as the well-known Pilula Rhei Composita (compound rhubarb pill) and Tinct. Benz. Co. (otherwise Friar's Balsam).

Another article also official for pharmaceutical preparations, and much in demand for veterinary purposes, is the quality termed 'Barbadoes.' This is not quite so expensive as the 'Socotrine,' although the difference in the market price is not large enough for the retail chemist and druggist to make a practice of charging small quantities of it at any materially lower figure. But this is not the case with 'Cape' aloes. (Out of about two hundred species of the aloe some one hundred and seventy are classified as indigenous to the Cape Colony.) This is a far cheaper commodity, often retailed at less than a quarter of the price of the 'Socotrine.' Although, according to official figures, the exports of aloes from Cape Colony to the United Kingdom during 1906 were three hundred and fifty thousand six hundred and fifty-eight pounds, the value thereof was specified as not more than two thousand four hundred and twelve pounds (less than one penny three-farthings per lb.). This article is often mixed with many impurities, and has no official standing in the *British Pharmacopœia*, although adopted by the foreign ones. But the quack, considering that there is no necessity for

him to supply humanity with what the best beasts require, often affects this literally third-class drug. And even if he and his kind confined themselves to purchase of the better qualities of aloes, the harm done by their professions of the universal healing properties of their vendibles would remain incalculable. Dr Spencer Thomson illustrated this in his valuable *Dictionary of Domestic Medicine* (published in Edinburgh more than fifty years ago, and destined to go through numerous editions) when he said of quack pills that these 'may by their strong action perhaps relieve some individual suffering under the languor of an oppressed system; he is delighted at the change, and meeting his invalid friend, who is suffering from the real debility of incipient consumption or from some other disease, persuades him to try the wonderful pills, need it be said with how great probable, perhaps irremediable, injury. It would be easy to multiply instances. One is enough.'

Those who are inclined to decry the sweeping terms in which itinerant and unqualified pill-vendors are denounced by the medical fraternity, and attribute the condemnation mainly to the apprehension of the latter lest their professional gains be diminished thereby, should be brought to recognise the fact that whereas the controlling authorities of the leading medical journals place embargoes on advertisements tendered to them which make fulsome reference to the efficacy of proprietary pills, they readily admit those of manufacturers who claim to be efficient makers of any pills specified in the formulæ of the *British Pharmacopœia*. Their general rule is to insert neither any notice of a pharmaceutical preparation of an undefined composition nor advertisements of proprietary pills and medicines whose formula is not disclosed.

A simple definition of the aloes drug is that it is the juice, evaporated to dryness, which flows from the leaves, cut crosswise, of various species of the aloe, the growth of which is restricted to fewer regions than the agave or American aloe (some specimens of which, according to the *Pickwick Papers*, caused discomfort to Messrs Alfred Jingle and Job Trotter when ejected from Mr Nupkins's house). This, though resembling the former, is a totally different plant, and lacks similar medicinal properties. In fact, there are various points touching aloes imported to the United Kingdom which require elucidation.

To begin with, the quality commercially recognised as Socotrine is not now peculiar to the island of Socotra. It is derived from the *Aloë perryi* and imported from the East chiefly by way of Bombay; and, to borrow the phraseology introduced into Mr P. Squire's ever-valuable *Companion to the British Pharmacopœia*, 'the real garnet-coloured, translucent Socotrine aloes from *A. perryi*, grown in Socotra, now seems to exist only as museum specimens.' Reference has been made by various writers to the beautiful violet colour afforded by the leaves of the Socotrine aloe. The drug imported under this designation comes in one hundredweight kegs, and, as has been inferred, commands a higher market value than the other imported kinds, and is only, relatively speaking, in small demand.

Formerly the main source of supply of aloes for veterinary purposes was the island of Barbadoes; but, making allegation on the authority of one of the oldest, if not *the* oldest, wholesale drug-firms in England, it appears that there are no consignments of real Barbadoes aloes imported here now. What still figures and is retailed under that name comes largely from the Dutch possession, the island of Curaçao, a place more associated to many with liqueurs than aloes. It is sent over mainly in eighty to ninety pound boxes, and occasionally in gourds, and fetches a better price when the colour is 'good liver.' When dark, it is termed 'capey.' The article is one of those drugs that improve by keeping, under proper conditions. The dark shade objected to has then a tendency to give way. 'Fair capey turning livery' is not an unusual class description of Curaçao aloes at the London drug-auctions. It would never do for a vendor of Barbadoes aloes to base his pretensions in favour of his ware on its being new and fresh, as his article might compare very unfavourably, all the same, with a consignment which had been stored for half-a-dozen years or more.

Its strength makes it much in favour for animal treatment. There are differences of opinion, but experts have considered two grains of extract of Barbadoes aloes to equal three of Socotrine. 'Uncommonly good that last lot of aloes you sent me' (it was the Barbadoes article), stated a veterinary surgeon to a member of a wholesale drug-firm. 'Have you got any more of precisely the same lot? I find it much more economical than what I bought previously. Half the quantity I used to give does for a dose. When I started giving as much as before I nearly killed one old horse.'

Cape aloes is imported in cases of four to five hundredweight each. Fortunately the colour and appearance are such as to prevent any habitual attempt at palming off this Cape article for Barbadoes aloes of good quality. It usually has a much more 'coaly' appearance; and, in fact, if some small bits be dropped among pieces of coal of equal size many persons would not be able to say which was which without a close scrutiny. No amount of storing will make ordinary Cape aloes attain the softer tinge of good-quality Socotrine or Barbadoes.

Not many years ago an East Indian aloes used to figure on market and be quoted in trade papers under the distinction of 'Hepatic,' and ranked second in value to Socotrine. But this separate classification has been dropped to all commercial intents and purposes.

A necessary explanation is afforded in various

encyclopædia articles of the fact that the aloes which figures in the Holy Scriptures is the wood of a tree which gives off a pleasant smell when burning; for the odour of the aloes drug of commerce is highly objectionable to the majority of people if subjected to fire, and considered normally unpleasant. In bygone days, when the rising generation was commonly subjected to more drastic treatment than is ordinarily dealt out to tender youth of the present century, aloes was often resorted to as a deterrent to children given to biting their nails, or to those with thumb-sucking propensities who showed themselves sceptics touching the certain advent, in consequence, of the 'great tall tailor' with his scissors, immortalised in *The English Struwwelpeter*. The recollection of that bitter taste is with some seniors yet, who have never forgotten their aloes-treated fingers, any more than the barbarous remedy of soap-and-sand commonly applied to incipient boils.

The drug was also resorted to as a medium for practical jokes, then considered so exquisitely humorous. 'I remember,' said a relative of the present writer in his hearing, 'how H—— gratified my love of sweets by giving me a sugar almond. He had bored through one end of it and taken the almond kernel out, and then filled up the hollow with aloes. I thought I should never get the nauseous flavour out of my mouth. I had begun crunching eagerly, and the horrid stuff all stuck to my teeth!'

It is because of the objectionable taste that so many adjuncts of a palatable nature are employed in preparations containing aloes. There are persons who certainly show no objection to a dose of aloes wine (at one time this was prescribed largely), because they appreciate the flavour of the sherry, which disguises that of the drug, mingled with it to a sufficient extent for them to regard their draught as an agreeable tonic. Liquorice and other sweetening commodities figure conspicuously in solid and liquid preparations of aloes. 'Aloin tabloids' are to be found at the head of any list descriptive of sugar-coated nauseous drugs.

In short, aloes is a remedy which a period of many hundred years has not served to supplant. It is true that the doses of it which used to be administered freely to old and young are now materially diminished, whether in the form of extract, pill, decoction, or tincture; but this is only a natural sequence in accordance with the general disposition of the medical fraternity, who decline to experiment on the powers of human endurance to the extent that did their forefathers, and realise that increased education has weakened the once only too popular belief that the more nauseous the taste of a medicine the greater good it would effect. 'You'll find old T——'s book a useful one still,' said an old practitioner to a student. 'I got a deal of good out of it. But as to his doses—well, all I can say is, if I were prescribed them I'd rather try them on a patient first'!

THE WELL.

The font in the Memorial Church at Cawnpore was erected by Queen Victoria 'To the Memory of Robert M'Gillup of the Bengal Civil Service, who lost his life on or about the 25th of June in carrying water from the well to the distressed women and children.'

'I, WHO within My hollow hand
Have held the raging sea,
And stilled the storms that swept to land,
And set the rainclouds free!
By whose command the fierce monsoon
Above the plains has burst—
I, who am King of land and sea—
I, too, have said, "I thirst!"

'Hung on the Cross, and dying there,
That all the world might see—
The whole wide world, whose sins I bear,
That nailed Me to the Tree!
Pierced by the anguish of the sword,
My life-blood slowly fell;
You brought to Me, your dying Lord,
The water from the well.'

'Lord, what am I, that I should dare
Even to lift my eyes
To Thy dread form that lingers there,
Against the darkened skies?
I never heard Thy thirsty moan,
Deaf to Thy plaint was I.
They nailed Thee there—my sins alone,
My shame, that made Thee die!

'I only saw the women fade
Beneath the burning sky,
The fierce light piercing every shade
Where sorrow's self could lie!
I only saw the children pine,
As, struck to death, they fell;
And to those thirsty ones of Thine
Brought water from the well.'

'I was with those who bore with thee
The heated furnace fire;
Mine was the sad and thirsty cry,
And Mine the fierce desire.
Mine were the lips for water faint,
The hands outstretched to thee,
And as thou gavest it to them
Thou gavest it to Me.'

G. ROBERTSON.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

IT is being remarked that in these days the British people are betraying a peculiar hysterical nervousness, a tendency to become much excited or greatly enthusiastic over matters of trifling importance, which has not been a characteristic of the men and women of this country, and cannot be fitted with any proper conception of the temperament of that robust, stolid, dignified old gentleman John Bull. A little panic is easily started. The general public—so it is said, and apparently with reason—will advance themselves into a frenzy of enthusiasm over matters which, though interesting enough in their way, concern the working of no great principle nor the welfare of the nation in any respect. Twice within the space of a few months, at times when public affairs of the utmost consequence have called for the serious consideration of all, they have been temporarily neglected while the general attention has been focussed on trials at the Old Bailey. The people called for whole pages of newspaper reports concerning these trials, and read every line of them with the utmost eagerness, and often enough read the reports in two or more newspapers lest in the perusal of a single account they should miss some trifling point. And then at the end, when their yearnings were gratified and the accused were discharged, they exalted as heroes a man who had been tried for murder and another against whom blackmail had been alleged.

It is not that the people were not entitled to feel satisfaction that those persons were acquitted, or that they, the proven guiltless, were not deserving of expressions of sympathy; but in each respect there was a violent exaggeration which was nothing short of hysterical. Only a small proportion of the people who day by day read all these pages of newspaper reports ever gave the time for an examination of the progress of the German naval schemes and the necessities of our own situation in regard to them. These cases are said to be fairly typical of a peculiar national nervousness and irresponsibility; and students of human life, manners, and tendencies, holding that there is a reason for all such circumstances, seek to find it, and make the suggestion that these ebullitions of feeling concerning what are only trifles are by way of mental relief from severe tension of natural anxiety amounting even to fear. They are merely reactions, but, being so, indicate the exceptional stress of the times, and an uneasy foreboding that for people of all classes there are vast dangers ahead. And indeed the average Britisher does seem to feel that the future looms blacker than for some decades past, and that in more than one respect the national security and our domestic peace and contentment are less assured than at any other time within living memory. While the menaces of a foreign Power are held in many quarters to be more dangerous than at any other time, and to call for an enormous demand upon our financial resources for the purpose of building more ships as answer to those menaces, we have on hand perhaps the most serious problem in domestic affairs with which the people have been confronted for many years, and one which threatens a mighty upheaval. It is peculiarly unfortunate that the pressure from the side of Socialism and the initiation of a scheme for old-age pensions should synchronise with the stern necessity of a great strengthening of the Navy, and all this, too, at a time when the nation has not yet recovered from the effects of the South African war.

Thus every man we meet is an out-and-out pessimist who likes best the company of other such pessimists, and regards the optimist merely as a person of no understanding. These symptoms of the times were much noticed by close observers during the late holiday season. City men at their seaside quarters, instead of playing their golf with that whole-hearted abandon which has been their wont, would gather together in smoke-rooms and on verandas to discuss nervously the latest aspects of affairs, and then in the mood of panic some would rush back to town for a day's attendance at their

 [*All Rights Reserved.*]

offices because of the most trivial rumour which had reached them, which at other times would have passed unnoticed. In the same mood of fear men of comparative affluence take to exercising the most trivial and really unnecessary economies. They conceive that they may shortly be poor. It is the truth that motor-cars for which a thousand pounds were given only a few months previously have been offered for two or three hundreds, and even at such prices have with difficulty found purchasers. These rich men say they cannot afford to keep them and to run them. The first enthusiasm for motoring is no doubt over, and there is a reaction; but this general nervousness has also much to do with these sacrifices, which are largely responsible for the depressed state of the motor industry.

There is good cause for anxiety. Whether one agrees with the principle of old-age pensions or not—all are agreed upon the basic principle that in a State that is financially sound there must be no avoidable starvation—it is admitted on all sides, though tardily on some, that the initiation of a scheme, any scheme, lays the foundation for enormous difficulties in the future. In Australia the other day the system of old-age pensions was extended by raising the amount to ten shillings a head, while at the same time the age limit was reduced to sixty-five. When Mr Asquith first introduced his scheme the cost was estimated at six millions a year; but a reckoning shows that if eventually we followed in the path of Australia the charge upon the country would be from fifty to sixty millions a year. And who will say that, having given old-age pensions at seventy, we are not likely soon afterwards to be called upon to give them at sixty-five, as is done elsewhere, and that there will not be a demand for the increase of the pension? And how natural it will be that those who are in need and feel that they may not live to sixty-five or seventy should urge that they should receive some moiety of their pension in advance. At one time a Budget of a hundred millions sterling was spoken of as an almost impossible horror, and a thing that the country could not bear. Now, with new and heavy charges on the nation, and the likelihood that if naval competition between this country and another is to continue on its present lines, the present naval estimates will before very long need to be increased by ten millions a year, it is predicted that we are almost within sight of a two hundred million Budget!

* * *

Politicians and statesmen are searching for new methods of taxation that will hurt the people least. Why not put a tax on certain forms of sport—say cricket and football, particularly the latter? At the first thought such a suggestion may be regarded by a large section of people as outrageous, and by others as improper and dangerous. We have always considered ourselves as a nation of sportsmen, and it has to be said that we have lived very fully up to our idea of what we are. At any cost, sport has always been encouraged and never hindered. The champion athlete has always been a greater celebrity than the senior wrangler. To make an appeal in the name of sport has always been to be assured of abundant success. When this sport meant merely the playing of games and indulgence in exercises by the people, and that cultivation of the body which tended to the general physical and mental welfare, there was everything to be said for it, and hardly anything against; but in recent years what we call sport, and particularly our national sports, have come to be very different things. On the one hand they have been elevated to a plane of importance at which they are dangers not only nationally but internationally; and on the other they have come to be not games and exercises for the people, but spectacles and commercial enterprises. Cricket is a great pastime, to be greatly encouraged; but lately there was talk of concentrating the interest of the Empire during an English summer on tournaments in which the mother country and colonies would engage. Is any game quite big enough for this? In the case of football there are every Saturday scores of matches held all over the country, at which tens of thousands of people pay for admission, and so scores of thousands of pounds are taken at the gates on each day by the proprietors of the clubs. These are purely business concerns, although the profits may be spent in a ridiculous and in some respects shameful system of buying and selling players and in other such ways. In recent years scandals have been unearthed showing how utterly rotten is the professional football over which the multitude 'goes mad' on Saturdays for eight months of the year. There is nothing that is healthy, nothing that is to be encouraged, in this sort of thing. Then why not tax it? Why not build an extra ship for the Navy some time by claiming threepence from every shilling that is paid for admission to the football matches? The tax would not fall upon the spectator. He would get his football just the same, and the only result would be that the people who manage it for him would have fewer thousands to spend in absurd and improper ways, and the tendency would be to make the thing a little healthier. It does seem that there are good and serious possibilities in this suggestion.

* * *

It may be said with some confidence that, taking all things into consideration, the most discussed man in the world to-day, outside the limited circle of kings and emperors, the man whose name is most frequently uttered, is William Howard Taft, candidate for the twenty-sixth American presidency. And it is not merely that by his candidature, with an unusually bright prospect of success in the election, he is already lifted to a

position of magnificent importance in the home politics of America and the international politics of the world, but that for a period of four years from now he will be one of the dominating human forces of the world, the head of the richest and most independent community in existence, a man of much more consequence than the monarch of most States. What with one thing and another, the American people generally reckon to spend a matter of a million pounds on the election of their President, and their feeling is that, having done this, and having disputed about the succession to the office for nearly six months, they would then like their President to be a President in being, and to rule thoroughly with no mean powers at his disposal. In many respects the President of the United States is endowed with powers which might be the envy of an ambitious king who was anything but an absolute autocrat. Not a Bill that passes Congress can become law without his signature, unless, when he has returned it with his alterations, two-thirds of each House support it and pass it again despite his veto. He can call either House or both Houses together for special session, and he may dismiss them again to such a time as he thinks fit if they cannot agree as to the time of the adjournment. He can grant reprieves and pardons for offences against the State; if he has two-thirds of the Senate at his back he may make treaties and appoint ambassadors, consuls, and all other officers of the United States whose appointments are not determined by any special regulation. Generally speaking, he can fill the most important offices just as he pleases. He can interfere in Church matters according to his fancy and disposition. He is the master of all the ports of the United States, and, without making any excuse for his interference, he can prevent a ship from entering any of them, even though his action might plunge the country into serious difficulty with some foreign Power. When there is war he is the Commander-in-Chief, and from the White House directs the course of the campaign; but he cannot declare war, although he may make peace as he chooses.

The latitudes and restrictions that are attached to the American presidency are altogether curious. In the matter of the restrictions it is notable that the American President is not allowed to leave the United States for a visit to a foreign country a single hour while he retains his office; and not only that, but he is not eligible to visit any foreign embassy or any foreign ship that happens to be in an American harbour, since technically both embassy and ship would be foreign land. Although it is a constitutional principle that is freely made use of that the President is always available at the White House to every American who feels that he must shake him by the hand, but these Americans still have a vast regard for the dignity of their President when foreigners are out, and he is forbidden to make the first call on any visitor to the country if that visitor happens to be below the rank of king or queen. He must not ride on the left-hand side of his carriage, and he must not play games of chance or indulge in any form of sport on the Sunday! Every man who rules from the White House must observe these rules, and the men who have ruled from there have been such as have well and worthily upheld the great idea and the traditions of the United States. The American says to the European that the latter cannot make up a list of rulers that can beat the list of Presidents of the United States, and after some little reflection it has to be admitted that this is no idle boast. So this election that is pending is a thing of vast consequence, and it is inevitable that the general interest in it should be so great.

* * *

Now, the man who comes to be the most favoured candidate for the American presidency seems to the people of the outside world to rise up to great prominence and distinction from nowhere. We do not hear much of this man until full particulars concerning him are thrust upon our attention a little while before the convention selects him as candidate. McKinley and Roosevelt did not seem very important figures to the world at large until their people called upon them to take up the supreme office. The average Britisher may now reflect that he had just heard of a person called Taft before all the talk about this election began; but he was not sure about him in any way whatever. The fact is that there is generally only room for one great man in the government of America, and his personality shines out afar into the world, and the light of none of his subordinates can be seen. Yet America always knows very well all about her coming Presidents for a long while beforehand, and it is a certain fact that for the most part they are trained thoroughly for the high office during a long period of years. This remark applies particularly to Mr Taft, and the feeling among those who know of him and his career most intimately is that never since the office was established has a man been so well trained for it, and been so obviously predestined for it, as in this case. Mr Taft's ambition from the time when he was a young man up to the present was not to occupy the presidential chair, but to become a Justice of the Supreme Court, and time and time again he has undertaken onerous public posts because others persuaded him that it was his duty to do so, when the reward was very doubtful and the goal of his ambition was removed farther from him. When the problem of how to manage the Philippines was presented in its acutest form to President McKinley, the latter said that he wanted a very exceptional kind of man for the job, one who was willing to kill himself with work if necessary, and who would be strong, big, patient, tactful, and yet one of the firmest men in the country when occasion demanded firmness. Secretary Day, to whom he gave this description of his ideal Governor of the Philippines, remarked quietly,

'Why don't you send for him, then?' 'Eh, send for him? You need to find that man,' retorted the President. 'Oh, he's away down in Cincinnati, on the bench there. Will Taft's his name,' the Secretary said; and then McKinley telegraphed for him. Mr Taft was astonished when he came and heard what he was wanted to do; he said he wanted judicial and not executive work. McKinley told him plainly that it was one of the most difficult tasks that had ever confronted the nation, that he was the man to deal with it, and that in this crisis he was expected to do his duty. So he went, and the world knows now how well he did his work. He succeeded when there was an almost general fear that he would fail, and he rescued America from a very difficult position, and made order from chaos in those unhappy islands. He did that because he was tactful, and made the Filipinos like him, and because he was firm and showed them that they would have to do his bidding. In the middle of his work the President telegraphed him an offer to make him the man he wanted to be, a Judge of the Supreme Court, and he telegraphed back without hesitation, 'Thanks, but impossible to leave here now.'

They say he is just a big boy, his face is kind, and his manner is gentle; but this big boy can cow a mob with his determination when the need arises. It was when he was a judge in Cincinnati that there was a railway strike, and a case came before him in which the issue was between the strikers and their employers. A large number of the former squeezed into the court, and they made no secret of their resolution that if the decision was against them Judge Taft was not to be allowed to leave the court alive. He gave his decision against them in smooth, undisturbed tones, and when he had completed it he paused for a moment, while the smile on his face was converted to a look almost of ferocity, and then, banging his fist on his desk, he shouted out, 'When you leave this room, you men must do so with the knowledge that if there is enough power in the army of the United States to run these trains, these trains will run;' and, so saying, he got up and walked unmolested from the court. The men felt they were beaten, and the trains were not interfered with.

* * *

The betting on this presidential election will now begin, and as it is always the more curious wagering when there is a considerable disparity between the estimated prospects of the candidates, it is expected to be very interesting this time. 'You Britishers don't know how to bet,' said an American friend to us one time. 'You always bet in money which a man can pay when he loses and forget all about it by the next day. Why don't you bet the man so that if he loses he must wear smoked spectacles for six months though his sight is perfect, or insist on his walking to his work on one leg or eating something to every meal that he does not like? That is making him a real loser.' Then our friend gave us some examples of bets that were made, and which indeed represented quite a common type, at the last presidential election. A Chicago policeman agreed on his side that he would have certain teeth removed from his upper jaw if Mr Roosevelt were elected, while his opponent was to be penalised by wearing a golden ring through his nose if he lost. A shipwright of Maine had to drink sea-water with his meals for two days if Mr Parker was elected, while the other man had to appear in public in his wife's clothes if Mr Roosevelt won. At Ilion there was a terrible bet made. The supporter of Mr Parker agreed that if his man were beaten he would live in a pigsty for a week; while the man who believed most in Mr Roosevelt undertook to be covered with oil and ashes, and in that state to stand in an open field while his opponent threw rotten apples at him for an hour or until such time as he was thoroughly tired and could throw no more. Quite a common kind of wager is that in which the loser agrees to go on a long journey with the winner, the former wheeling the latter in a wheelbarrow all the way. In faithful fulfilment of such a contract one man duly wheeled another from New York to San Francisco after the last election. There are wagers which we should describe as being of a same type which are still more wonderful. Thus on the eve of the last election two merchants met in a New York hotel and began to discuss the forthcoming contest. As they held opposite views, the argument became heated, and eventually one of the men said, 'Look here, I will bet you my sugar refinery, which is worth sixty-two thousand pounds a year, against your miserable little cloth-shop, and I don't care whether you are making money out of it or not. I am certain that I won't lose, so it doesn't matter; Roosevelt can't lose.' And let it be said that this offer was accepted, the bet was made and the terms were drawn up in legal form, and it was mentioned in the document that the cloth business was worth a matter of one thousand two hundred pounds a year. Here in happy England we do say sometimes that the Government is ruining us, and different people say that of different Governments; but surely it is seldom that we are ruined in the simple process of making the Government, in the mere election to power of a party.

CASIMIR LE SOMBRE.

CHAPTER VII.

DEOTIMA was right in saying that the black morass was forty miles from the château. I had twice been there on hunting expeditions in happier days, so the road was not altogether unfamiliar to me; but it was a strange and weird ride that midnight gallop through the solemn glades of pine. The splash of my horse's hoofs on the moist ground sent the night-birds shrieking from their roost, the wind sighed mournfully among the trees, while a thousand fantastic shapes seemed to rise up menacingly from the tangled brakes and stretch out their crooked arms as if to touch me; occasionally a dripping bough would sweep across my face like the touch of an icy hand; the gray, lichen-covered stones flew by me in ghostly procession. Now we were crossing some open glade fitfully lighted by the pale rays of the moon; again our course lay through Cimmerian darkness, where the heavy branches closed overhead like a funeral pall; but still the brave horse pursued his swift career without showing a symptom of fatigue.

At rare intervals we reached a small oasis in the sea of forest, where the trees had been cleared away and a little hamlet nestled among peaceful-looking fields. It was pleasant to hear even the surly bark of the watchdog as I passed, so utterly alone did I begin to feel in the awful solitude of the night.

I had completed more than half my journey without meeting a living soul, when, in traversing a narrow glade, something struck my face more deadly cold than the wettest branch I had yet encountered, while Zampa gave a snort of terror and leaped to one side, almost unseating me. I looked up, and there, dangling white and bare in the moonlight, were a pair of human feet! They belonged to the figure of a man, clothed in a long sheepskin coat, who was hanging by the neck from the branch of a tree. I recognised the high cheek-bones and round head, with black matted locks cut straight in front but flowing loose behind, of a herd on the Count's farm who had often been with messages to the château. The large eyes were preternaturally dilated, and as the figure swung slowly backwards and forwards with the shock I had communicated to it, it seemed almost as if endowed with life. Similar ghastly burdens depended from other branches of the trees, for the paternal rule of the Czar had been enforced here.

Turning from this terrible spectacle with a shudder, I shook the bridle and dashed through the forest at the fullest speed of my horse.

We had not proceeded more than a mile when Zampa suddenly threw up his head and uttered a shrill neigh, which was immediately responded to by a dozen horses in a neighbouring thicket, while a rough voice challenged me in Russian. In my mad flight from the corpse of the herd I had almost ridden over a picket of Cossacks. I do not know if the Cossacks are more civilised now, but at that time the very name of Cossack was a terror in our ears, and a thousand stories were told of these wild riders from the Don, who spurred over the battle-fields with their long lances and mercilessly despatched the dying and the wounded. Already I could hear them unpicketing their horses, and as I galloped into the darkest shadow of the pines a dozen rifles flashed among the trees and as many bullets whistled round my head.

It was now a race for life or death. I had often hunted wild beasts before, but had never known what it was to be hunted myself. In vain did I urge on Zampa with knee and hand, and doubled through the winding glades before me. Two of my pursuers, better mounted than the rest, stuck close to my heels like bloodhounds, and I could hear their guttural cries as they incited their wiry little horses to fresh exertions. At last I got entangled in a piece of marshy ground that delayed my flight, and in a few minutes saw the long spear of the foremost of my pursuers gleaming behind me. Drawing a pistol from my belt, I turned in the saddle and fired, not at the man—I could not bring myself to do that—but at the horse; there was a heavy thud, a volley of oaths, and man and steed rolled splashing into a pool of water. The next instant Zampa gained firmer ground, and in a short time I found myself alone, for the second Cossack had not cared to share his comrade's fate.

I was now safe from immediate pursuit, but had completely lost my way, and it was only by catching occasional glimpses of the North Star that I was able to form any idea of the direction in which I was going; moreover, I had to be very careful not to fall in with another Russian outpost. The moon had sunk, and poor Zampa was beginning to show symptoms of distress. Thus we plodded on for two weary hours in doubt and uncertainty, till Zampa suddenly struck his fore-legs firmly in the ground with a low snort, and refused to advance. I peered into the darkness, and saw a wide expanse of dangerous bogland extending before me. On the right rose the whitened branches of a tall pine that had been riven by lightning, from the rotten wood of which proceeded a pale phosphorescent light. This was a welcome sight, for I knew that at last we had reached 'the black morass.'

CHAPTER VIII.

CAREFULLY skirting the morass, as I made my way in the direction of the river which I knew flowed through it, and just as the intense chillness of the air betokened the approach of dawn, my eyes were gladdened by the sight of the fires of the Polish encampment.

The sentinel on guard challenged me as I approached, but when he saw the White Eagle on my cap he lowered his piece and led me at once to the commandant's hut, a rude structure framed of pine-branches.

A tall man came out, and seizing a flaming bough from one of the fires, the better to regard me, asked in courteous tones what tidings I brought.

'That the enemy will attack your camp at daybreak, colonel,' I replied, assuming as manly a voice as I could.

'Ha! whom do you come from?'

'The Countess Deotima Czartoryska.'

'My sister! Have you a letter from her?'

'Only this,' I said, handing him the letter the messenger had brought.

He read it attentively by the flickering light, and then, turning to me, said warmly, 'Young man, you have done me a great service. What is your name?'

'Call me Casimir,' I replied, giving the first I could think of.

'Good. I will not seek to force your incognito. The service is none the less. It is too late for us to retire, but we may at least prepare for defence. When did you leave the castle?'

'At eleven.'

'Did you see anything of the Russians on the way?'

'I was chased by a Cossack picket about ten miles from here.'

'Ah, they will not be here for three hours at least! That is good news.' Then, regarding me kindly, 'Poor boy, you look tired! Go in there and lie down. I will call you when it is time. Your horse shall be well cared for;' and, leading the way into the hut, he pointed to a heap of fresh straw, on which I was soon sound asleep.

When I awoke the sun was shining brightly, and Colonel Ladislas was standing at the entrance of the hut buckling on his sword, while an unusual bustle seemed to be going on outside.

'Do you wish to take part in this affair?' said the colonel as I joined him; 'every hand is of value to-day. Have you had any experience of military life?'

'My father was a Cuirassier,' I replied stoutly, for I could not help feeling still a little strange in my man's dress, and above all I dreaded my secret might be discovered.

'Good! I have lost my lieutenant. You shall take charge of the cavalry. They will be in reserve, and may not have to fight at all; but if you are called on to charge I know I can depend on you. Ah! there is the first shot. We shall have warm work to-day;' and with a gay smile he strode away to where the infantry were posted in the wood.

Though our force was so meagre the position was well chosen. In the rear ran the river, which at this season was unfordable; on the left extended the morass, impassable for cavalry; while in the thick forest to the front and right four small companies of infantry were posted so as to form two sides of a triangle, and extended in such a way as to conceal the paucity of their numbers. Two more companies were in reserve, and behind all was posted the troop of about fifty horse, of which I had the command.

What would the good nuns at the convent have said if they could have seen me now?

I cannot describe the fight. At first every shot sent a cold shiver through me; but gradually, as the firing swelled into a roar, mingled with the shouts of the assailants, my spirits rose, and I longed to be in the thick of it.

For some time the Russian volleys did not do much damage, being scattered by the trees, while our sharpshooters made deadly practice among their closely packed ranks; but suddenly we discovered that some Finnish riflemen, the best shots in the Russian army, had crept on to the morass and were enfilading our position. This caused our line to waver; and with loud shouts and clapping of hands the Russian columns pushed forward with the irresistible weight of numbers, doubling our two lines back on each other.

It was in vain that Colonel Ladislas threw himself in front of his men with reckless devotion. A shot struck him under the arm as he waved his sword on high, and he fell to the ground in the midst of the open space which he had been defending, and on which the Russians were now beginning to pour.

This sight decided me. Calling on my men to follow, I charged down on them with my small troop so suddenly that they had no time for preparation. Three times we swept through their ranks, scattering them right and left; and then placing myself at the head of the infantry, who had promptly rallied, I ordered them to charge with the bayonet. The rout of our foe was now complete; for, entangled among the trees, they fell an easy prey to the fury of attack, those who were not killed flying through the woods in hopeless panic and confusion.

When I returned to the camp a sergeant approached, and, saluting, told me that the colonel wished to speak to me.

'But is he not wounded?' I asked.

'They say he is dying, but he has ordered me to find you and bring you to him as soon as possible.'

I followed the man sadly. A great reaction had come over my feelings; the excitement had passed; and as we picked our way among the bodies which still strewed the ground where the fighting had been hottest I shuddered to think of the dreadful work that had been done in the last few hours.

We had just reached the hut when a dark figure in a cowl came out. It was Father Ambrose, but he passed me by without a sign of recognition; and, remembering my disguise, I checked the exclamation which arose involuntarily to my lips.

Colonel Ladislas lay on the same heap of straw that I had slept so soundly on in the morning. He

breathed with difficulty, was ghastly pale, and indeed looked like a man whose hours were numbered; but his eyes still remained clear and piercing.

'You have done us noble service, Casimir,' he said, pressing my hand feebly as I knelt beside him. 'Had it not been for you my poor followers would have been even now at the mercy of the cruel Russians; for myself it does not matter, but I grieve to think what will be their fate when I am gone. Few of them had ever shouldered a rifle before the last two months, and those who are old soldiers only know how to obey, but have never had the responsibility of a command.'

This speech was not uttered consecutively, but in short, spasmodic sentences, broken by many painful pauses, while the sufferer struggled for breath. I was deeply moved and listened in silence, for there was nothing I could say. Presently he continued, looking at me wistfully:

'You are very young, but you have shown to-day that you have the true instinct of a soldier, the knowledge not only of how to fight but to act decisively in the moment of danger. It is a gift born in us, and cannot be acquired. I am a dying man, Casimir; promise me one thing—promise that you will take charge of my regiment when I am gone, and see my men safely through the dangers by which they are now environed.'

Here was a strange position to be placed in. I, a young girl of eighteen, who had never fired a shot in anger before the previous night, was asked to take command of a half-drilled band of insurgents in a country swarming with enemies! I was so frightened at the result of my own temerity that I could not speak, and knelt gazing at the colonel in utter confusion. At one moment I was almost on the point of confessing my sex and appealing to his generosity to keep my secret; but a feeling of shame prevented me, while at another I thought of flight.

'Well,' he said, observing that I did not answer, 'will you refuse me this boon? How can I die happily if I know that all these poor fellows who have served so faithfully will be left to perish? They are like children to me, you know.'

Thus driven into a corner, I sought a girl's last refuge, and asked for time.

'Colonel,' I said, 'I *cannot* answer you now. Give me an hour to think, and then you shall have my reply.'

'Be it so,' he said with a sigh, 'but let the hour be brief, for so are the hours I have remaining on earth.'

It had struck me that, as Father Ambrose was in camp, he might be able to counsel me; perhaps to him I could bring myself to confess my position. However, I was saved all difficulty on this point, for as I left the hut a hand was laid on my arm, and the Father himself led me a little way into the forest. When confronting me he observed quietly:

'Daughter, I perceive the hour for action in our cause has already come, and I rejoice to see you have not been found wanting. But you are perplexed. Colonel Ladislas, I know, has asked you to take command of his regiment. What answer have you given? It is on that subject I would speak to you.'

'Nay, it is your counsel I would ask, Father,' I replied.

He paced backwards and forwards in deep thought for a few minutes, and then, stopping abruptly, said:

'After all, 'tis a question of humanity. It is given to the many to obey, but to the few to command. You have shown to-day that you can do this, and without a leader these children of our cause will be lost. On the whole, I advise you to accept the command.'

'But, Father, you have recognised me; may not others do so? It would not be becoming, nor could I bear that my secret should be known.'

'Yes, I knew you,' he said, smiling; 'but you forget that I have often seen those rings on your fingers before.'

It was true I had forgotten to remove my rings: a large signet of my father's and a beautiful diamond hoop that the Countess had given me on my last birthday.

'But how can I leave Deotima?' I cried. 'If she were safe I might do it, but I cannot desert her.'

'Why not take her across the frontier?' he replied. 'Poland is no place for her now. Nay, why not take her brother also? He might perhaps live if properly tended. I am a man of peace; but if you will take your troop and see the Countess and her brother safe across the Prussian frontier I will remain here till you return. You need not be gone more than four days, and after the lesson they have received the Russians will not renew their attack till they can get reinforcements.'

'But, Father, if I do this you will promise to keep my secret?'

'It is my calling to keep secrets,' he replied grimly, and turned towards the colonel's hut, leaving me a prey to many mingled feelings.

That night, accompanied by forty of my troop and a covered cart in which lay the colonel, I started for the château.

(To be continued.)

THE MERCHANT SERVICE AND APPRENTICESHIP.

THE paper which recently appeared in *Chambers's Journal* on the subject of the officers of the merchant service has interested me greatly, and as part of the same subject I wish to write a few words about apprenticeship. The lessening of the supply of capable officers has several explanations, and I think I can afford one. The whole question is not only of widespread interest, but of national moment.

My youngest son has an exceptionally spirited temperament. When he left school it was plain that a sedentary career would be useless for him. He was a fairly good scholar, intelligent, and of good judgment. He understood ciphering, and was fond of books of adventure, but had distinguished himself up to that time mainly as a football captain. He often won games by clever tactics. It was thought that an outdoor life was most suitable for him; and accordingly, after some difficulty, I placed him with a farmer, to learn the trade of dairying.

The reports of his progress which we soon began to receive from the country were somewhat disquieting. We learned that he organised swimming-matches amongst the village boys, and also often led them through the village to the sound of music on the mouth-organ—for he is fond of music. We were told of conflicts with the rural police, occasioned, I believe, largely by his ignorance, as a town-boy, of rural laws and customs, and by his habit of climbing trees. We then heard with some dismay that he had been seen standing on the ridge of a high roof, with folded arms, proclaiming to the village that he was Nelson. After this we were not greatly astonished to hear from his employer that my son was not likely to make a good dairy-farmer. His character was good; he was honest, and had no vices; but he was not suited for the business.

He therefore left the farm and came home. After a time he told us that he wanted to be a sailor. He would be nothing else. He overcame his mother's reluctance, and I set about trying to find a shipping firm to whom he might be apprenticed. I applied to a firm who own sailing-ships, for I was told that it would be best to put him on a sailing-ship at first. I received a favourable reply; but whilst the negotiations were proceeding the boy, with his active disposition, got slightly injured in some rough outdoor sports, and was, in fact, confined to his bed for a few days. This was some evidence to me that his true sphere was the sea, and that he would therefore probably be safer at sea than on land. Unfortunately, whilst he was laid up a letter came from the firm saying that a sailing-ship of theirs would start soon, and requiring him to present himself immediately in order to sign the indentures. He wanted to leave his bed and go, but I prevented him, seeing also that the firm would hardly have accepted him if they had seen him in his injured condition.

I went myself, however, to the shipping-office, in the hope of somehow delaying matters. And here I had my first experience of a shipping-office. I do not say they are all alike. All I know is that, although I had got together a few pounds to pay a premium, and did not come to them at all as a suitor for favours, I was denied access to the principals, and only saw a clerk, who treated me with brusqueness bordering on incivility. I am, myself, accustomed to business, but I had never met quite the same thing in business before. I left the office, after ascertaining that there would not be another sailing-ship of theirs leaving England for six months.

As soon as the first ship had sailed the boy completely recovered, and as he was eager to go to sea, I sought about for another firm. This time I obtained superior introductions. It turned out that the new firm owned no sailing-ships, but only steamships. They offered to take the lad as an apprentice, without premium; but it is only fair to state that they suggested that it would be better that he should go first on a sailing-ship. But as the matter was somewhat urgent, I thought it best to accept their offer, and at once to get the boy to sea somehow, trusting that he would obtain some experience of a sailing-ship later. There I admit I made a mistake, and I believe it is true generally that the best way to start a boy in the profession of the sea-service is to begin with a sailing-ship.

However, the indentures were signed and everything was prepared. We got together his kit. We bought a proper sea-box and a bag to hold his bedding. We put into the box a full equipment, including new uniform, oilskins, sea-boats, and a lot of old clothing still serviceable. There were also included a few tabloids of medicine, some glycerine, a mosquito-net (as he was going to the tropics), and of course a Bible. I told him—as indeed he partly knew—that in the life of a seaman hardship and drudgery were to be encountered, but that he must go through it cheerfully in order to learn the trade or profession of navigation, so as to become in due time an officer, and to this end he should observe and learn everything he could, and do his duty loyally to the firm, who would, I believed, in return stick to him and recognise his loyalty. I also took him through some higher parts of Colenso's Arithmetic and some matters of geography, so as to refresh his school-memory, and these things he mastered with ready application, understanding them to be necessary to his career.

About this time we received some letters from the youths of the village where my son had been, expressing a hope that he might return to them

and revive the former glories. But this was out of the question.

In due course the boy joined his ship. Although extremely modest, he had displayed some little pride in putting on his new uniform and badge at home, in a way quite exceptional with him, for he generally hated display; but in this case no doubt it was natural that he should show some liking for wearing the uniform, as representing the profession he had chosen. But on the day when he joined the ship he put on some old things, because, he said, he wished to show that he came aboard to work; and, indeed, he was fully aware that the uniform is seldom worn except in port. Also, as we learned afterwards, he gave out that his name was Jack—which we call him at home—as he did not like to use the somewhat rare Christian name that he bears; and so he was afterwards called Jack on the ship.

The voyage was to be a long one, the ship touching at three continents, and being, in fact, of the 'tramp' species, concerned in carrying coal and grain, mainly; not passengers. We were dependent for news on the letters he sent at each port. These soon began to arrive. He described in a business-like way all the incidents of the voyage, under headings of date, and with simple brevity. From his writing the dates and arranging the facts clearly we thought he had been put to copying-out the log-book, but such was not the case. The first day he had of his own accord climbed both the masts, to practise in case he should be ordered up. Then there had come a storm—the worst, it afterwards turned out, that the ship had ever encountered—but he made little of it in his letters. There were the usual sea-incidents. But, amidst all the detail, two facts began to stand out. The boy stated them, but did not make much of them in his letters; he told us more fully afterwards. These facts were (first) that he was not being taught, and (second) that he was not being fed properly.

It transpired that, except that he did not sleep in the fo'c'sle, his food, work, and conditions of labour were exactly the same as those of the ordinary seamen—who themselves were treated badly—and that the bulk of his duty was to clean the iron and the paint of the ship. He had no objection to cleaning paint or doing whatever else was necessary. As a matter of fact, he shifted coal in the bunkers, performed all manner of menial offices, and acted as night-watchman in port without any great squeamishness. On one occasion in a foreign port he was kept shovelling coal at the bunkers for fourteen hours together, with but a short rest in the middle of the day, when he stretched himself on deck, tired, and black all over with the coal-dust, and on waking from a doze saw the face of a gentleman looking at him, a missionary in charge of some Christian mission in the port. The missionary asked who he was, and on being answered, 'An apprentice,' was overcome with astonishment and made many inquiries. But the point is, that with all this, the apprentice was taught practically nothing of navigation, and that whereas the seamen were paid, at all events, something, he was paid nothing. He did, in fact, a man's work for nothing. The food was rotten. He took it once or twice to the captain, and the captain, after judiciously throwing it overboard, ordered the cook to continue as before. The lad had not been brought up delicately. In fact, he despised luxury; but the putrid meat contained the ordure of rats, the biscuit was sodden and mouldy. It was bad in quality, insufficient in quantity. Several times it made the crew ill; and on one occasion, prostrate with a stomach disorder, the boy managed to cure himself by swallowing half the bottle of glycerine that I had given him.

The lad, with the faculty that belongs to him, had early become popular with the seamen, not the less because he resisted the invitations which at first they extended to him to drink with them, but which they soon discontinued when they understood his character. He could box, and displayed no lack of courage, and so he became rather a favourite. They all advised him, however, to quit the ship, which they said was no good to him or anybody else; and making all allowance for the grumbling habit of sailors, there is no doubt they were right. The second and third officers, indeed, said the same; especially the third officer, who often conversed with the boy at night on the bridge, and who was a true friend. The ship, it seemed, never had the same crew twice, nor did the apprentices stay; some had run away abroad rather than return home in her.

The inkling of these things that the letters conveyed, and a hint that he might come home on the completion of the voyage, caused me to write and tell him to do what he thought best. I confided in his judgment. Sure enough, as soon as ever the ship touched an English port, he put his box ashore in the dead of the night and escaped. Ashore he accidentally ran against the boatswain—an excellent seaman—who saw the situation, and then looked another way. Now, as I am not telling you or anybody else the name of the ship, I am not betraying any of the seamen or officers who showed such human fellowship.

So he came home again safely, bringing his sea-box containing his uniform—which he had never once worn outside the house—and all his things, except some old clothes that he had bartered for shells with black people at the tropical parts where he had been. He looked well, but this was largely because he had been able, out of his own money, to buy food for himself, during the latter part of the voyage, at European ports.

He likes the sea, does not mind the necessary hardships of a seaman's life, but hates the unnecessary hardships, and declines to go on a ship where he can learn nothing. He would try another ship but that his mother now hesitates, and he thinks too much of her to go against her wishes. So his career, as far as can be seen at present,

is spoiled; though perhaps a better ship may be found.

The shipping company wrote to me for damages for breach of indentures. I declined to pay, and have not heard further. It is quite possible that in the matter of food the company are not to blame, although liable.

I might write much more about the treatment of sailors as well as of apprentices. I think it a folly as well as a shame that needless hardships, as in the matter of food, are—despite all our legislation—still inflicted on seamen, not as a necessity of the sea, but simply for gain. From what little I now know of it, I think, too, that the whole system of training officers for the merchant service is defective and chaotic. Commercial development on unscientific and inhuman lines is eating the seed-corn. The supply of capable officers cannot be maintained unless shipowners, as a whole, treat them better. A youth who, as a necessity of his calling, is prepared to face with promptitude and courage all the risks of the sea, ought not to have foolish obstacles placed in his path in his attempts to learn his profession or have his health undermined by needless privation before he can attain promotion in it. In these days of scientific invention there is no longer any necessity for starvation even in sailing-ships. Yet if you ask officers you will find that most of them have been starved when they were beginners, and that others, through needless rigour or the extra work caused by undermanning, are afflicted with rheumatism, the result of sleeping in wet clothes, or are weakened by deprivation of sleep. The seaman does not want to be coddled, but if the merchant service is to maintain its supremacy he must be treated as a man.

THE CHAIRS ON THE VERANDA.

By Rosaline Masson, Author of *Leslie Farquhar*, &c.

COLONEL EVERETT tied his tie in front of the glass, on which the two tall candles from either side cast an uncertain but becoming light. He bent forward in order to see more clearly, and, having completed the little white bow to his satisfaction, shut the drawer from which he had taken the tie, and pushed the silver brushes into position. Then he stooped to blow out the candles; but in the act his attention was attracted to a vase containing three huge, exquisite roses of different shades of red, each proudly erect on its thick stem, surrounded by its own leaves. He took up the vase, and bent his handsome, elderly head to inhale the fragrance. Then he smiled. 'A pretty notion that!' he said to himself. 'We all know and like to put flowers to greet a woman; but a lonely old bachelor! He is generally accredited only with appreciation of his creature comforts. *This* gives one a feeling of coming home.' He looked round the room. A little fire burnt brightly, though it was August and the day had been warm. He smiled at that. 'A concession to my years in India,' he said. 'And my age,' he added.

He turned again to the glass, and glanced whimsically into it, as to an old and tried friend with whom he had shared many a joke and many a wistful thought. The dark, carved wood round the mirror framed for the moment one of those faces that conceal a history that would be well worth reading, and present to the world only a courteous and finely tempered present. The iron-gray hair was close-cropped, and much hard brushing had permitted its natural tendency to curl to show itself crisply only at the parting. The eyes were eyes that had seen much; but the lines on the face were lines of humour and of endurance, not the footprints of indulgence. It was a handsome, mellow face; and the assured bearing of the man, even here as he stood by himself in the candle-light, showed him a man of achievement and position.

He put out the candles and went to the window, drew up the blind, and opened it on to the fresh autumn tang of the rich Highland air.

'I believe it is the same room that they have given me!' he thought, straining his eyes, as they grew accustomed to the semi-darkness, and noting the outlines of the hills, and the nearer clumps of trees, and the gables of the great house. He betrayed his open-air instincts and experience by recognising the room thus, rather than by its interior; though the interior was characteristic enough—low ceilinged and high wainscoted, the walls at quaint angles, and the little window set deep into a recess formed by a gable of the house.

'Yes, it is the same room—thirty-five years!' he said. 'What a boy I was!' He looked again at the dim mirror, now lit only by the flickering fire. 'Did you recognise me?' he seemed to ask it. Then he suddenly turned, as if by some thought, and leant out of the window, over the tangle of ivy and creepers that surrounded the window-frame, and peered down below. Round the gable of the house the end of a veranda protruded; and there, hidden behind creeper-clad pillars, were grouped a few chairs, pushed back, as though their occupants had just quitted them. Colonel Everett drew a deep breath.

Thirty-five years, as he looked down at those chairs in the veranda, vanished. He was again a boy of five-and-twenty, eager, egotistic, confident, and in love. Again he was looking down from this same ivy-clad window at the chairs on the veranda and the lady of his dreams. It had not been autumn then, it had been an evening of early summer,

and the level rays of the golden sun had been on her, touching her splendid hair and the white of her girlish frock. And he had stood looking down at her for a moment, gathering courage to go to her and speak. And suddenly, round the angle of the house, there had come to her—the other man. And the boy above had seen the look in her face as they had met, had seen their meeting. And then he had turned away quickly.

It was the picture of that meeting—that look in the face of his lady of dreams as she had raised it to another man's kisses—that he had carried with him to India. It was the first of his gallery of pictures. For long it had been the only one, and he had seen it before him day and night—the listless, scented Indian nights, at his lonely station on the plains, where the denizens of the jungle would prowl by dark, and their footsteps be scanned by the natives in the morning. And he had thought of it as he rode at the head of his few men against the many fierce hill-tribesmen that day that had won for him his first promotion.

It was while he was recovering from his wounds in hospital that he had read it in a home paper: the announcement of her marriage. The other name in the announcement was not the name of the man at whose coming he had seen her face light with love, in whose arms he had left her, whose wife he had long since pictured her. It was the name of the owner of the house in which they had been fellow-guests that day—a distant cousin of Everett's, a wealthy man, vaguely remembered as elderly, dull, taciturn, unapproachable.

It was some years later that Everett had added another picture of her to the first—a picture of a proud, beautiful woman who swept past him in a crowded London room. He had known her at once—his lady of dreams. She was changed from the little, slender girl, her face alight and wonderful. She was again in white, and the diamonds flashed at her throat and in her hair, and others besides Everett turned to watch her with the elderly husband—the grave, tired man of much wealth—in her wake. To Everett, that second vision of her revivified her image, which had grown, during the years, into the blurred dream of a dream, only real in that it came between him and the realities. And, looking at her, he had remembered how the other man—the man she must have loved—had gone abroad, gained distinction, and only the other day had died. And, looking at her, he had wondered if his lady of dreams were a happy woman.

After that he had seen her again at various times, and met her often in gay crowds and brilliant scenes. Then the years had closed in upon them again, and distance had again intervened. His duties had led him to far places, and brought him into many contacts, and laid upon him large responsibilities and full days and anxious nights. And still, deep in his memory, was indelibly engraved her haunting face. Many other things had crowded the canvas of his life, had filled his mind and his thoughts. Other troubles, other joys, other people, other ambitions—fulfilled or lived down—had carved the lines on his face. And now, once again, he was come to stay at the house where he had stayed thirty-five years ago, when he had been a boy of twenty-five, and had loved so passionately! He smiled pitifully now as he remembered how his heart had been broken in this very room.

Was it the influence of the room, of that group of chairs on the veranda, or was he growing old, that it was the first faint blurred picture of her that stood out in his memory to-night, and not the later ones, more brilliant in their later colouring? For the last picture of her was recent; and, unlike the others, it stood alone in the canvas—the portrait of a widow, fine, tall, slender, much older, with her unforgettable face.

The house, hers to-day, would be her son's to-morrow. She had invited a gathering of relatives and friends, old friends and new, to celebrate her son's twenty-fifth birthday and his coming of age. There was to be a tenants' dinner, speeches, and toasts. Colonel Everett had been bidden as an old friend and an honoured one, and a cousin of the father's family. There had been additions to-night to the house-party, and the room was full as Colonel Everett entered it.

'We have not been so large a party here for many years,' the hostess said. 'It is like old times,' she added.

Yes, it was like old times! There was the buzz of happy talk and laughter; there were the groups of young people—pretty girls in white, and young men, college companions of the son's; and there were a few elderly folk, gray-headed, benign, smiling.

Yes, it was exactly like old times! But, ah, the change! He looked from the young girls in white to the lady of his dreams, stately in her sable robes, dignified, gracious, welcoming her guests. The carriage of her head was regal; and her glorious hair, that he had loved so well, was massed in waves as he remembered it, and diamonds flashed on it to-night in honour of her son. Yes, she was the most beautiful woman still, as she had ever been, the lady of his dreams. And, had he thought of it, Colonel Everett might have known himself now to be, what perhaps he had not been in his youth, the handsomest man present. The young girl who was confided to his care to take in to dinner felt it, and was a little overawed by the honour. He was gratified by her evident regard and admiration, pleased by her winsome prattle and her pretty eyes.

'I stayed in this house thirty-five years ago,' he told her, 'and I find that nothing has changed.'

The pretty eyes opened wide. 'Thirty-five years!' she exclaimed. 'Why, we were none of us born!'

'No,' he answered smilingly, 'you were none of you born; but you are all just the same. And so am I,' he added, as if he had made a discovery.

She thought him rather mad then, and looked

diffidently at him, uncertain what to say. And she found she need not make any answer, for he was looking past her, towards their hostess. And, as the girl hesitated, a hush fell upon the table, for some one had risen to propose the health of the young heir.

Colonel Everett sat looking along the table, between the shaded wax candles in the heavy, old-fashioned silver candelabra, over the massed flowers in the silver bowls and slender vases, at his lady of dreams. She was looking down and smiling as she listened to the ponderous commonplaces of the county neighbour. And then, amid much laughter and clapping, the boy himself, at the foot of the table, rose to return thanks. And suddenly his mother looked up, and Colonel Everett saw another expression in her face to add to his gallery—her expression of pride and love and yearning towards her son, as he stood making his nervous, boyish, stuttering maiden speech.

'Thank you all very much,' it ended. 'I 'm sure I—my mother and I—are awfully pleased to see you all here to-night.' And he sat down, amid much clapping.

Colonel Everett clapped too, and glanced kindly at the boy. He was accustomed to dealing with young men, to quickly judging them, to placing them. He liked this young man: liked his nervousness, his wholesome, frank face, his well-knit frame, his boyish phrases; liked, above all, his reference to his mother with himself. And yet—he 'felt chilly, and grown old.' Was there to be no place for him, then? Was there never to be any place for him? Was she never to need him?

When he had himself been a boy—the age of this boy now, young and strong, self-confident through ignorance and not through experience, eager, his heart on fire—he had wanted her. Ah, how he had wanted her! Wanted her first love, when she was but a girl—a child, he should think her now; and there had come the other man round the shadows of the pillars and the creepers, and her eyes had lit with the love-light. That was his first picture. What had prevented those two from marrying? Should he ever know? But, whatever had prevented it, whatever story lay in her past, it had not given her to him. He saw her again as he had seen her in the pride of her beauty, as she had swept past him in her heavy white robe and her jewels; and in her wake the gray, dull, apathetic husband. That was his second picture.

Was there always to be another figure in his pictures of his lady of dreams? For now, into his last canvas, had stepped this boy, careless, appropriating—'my mother and I;' and again there was the love-light in her eyes. Was she happy at last? Whatever her mistakes had been, whatever she had done or left undone with her life, it had at least brought her this. She had her son. *He* had no son. And Colonel Everett, the man of achievement, who had made and unmade so many careers, who stood there so tall and soldierly of bearing, so genial and courtly of presence, felt the sudden death-like prospect of loneliness.

They were dancing—the young people—and he slipped away, and went up to the little oddly-shaped room in the gable, flung a log on to the neglected fire, and went to the open window, where the soft night wind was stirring the curtains. The harvest-moon was shining down on the scene, cold and dead and burnt out, white and unfeeling. All the lawn was light as in the day-time, and so was every red rose that stood out of the little rose-beds cut in the turf; but lawn and roses were without colour. The pine-trees stood black against the pale, starry sky; and far off the dogs bayed and howled in the kennels, and over in the wood the owls hooted in the silences.

Colonel Everett sat long at the window. The moonlight fell on the veranda beneath and on the group of empty chairs. Thirty-five years!—a lifetime to the young, when it lies before them: yesterday to the old, when the years have passed.

A faint, pleasant odour of a cigarette; and the Colonel glanced down. One of the chairs was occupied; he could just see a man's foot, crossed over a knee. Some one tired of the dance, Colonel Everett thought, come out to enjoy a quiet smoke; and, as he looked, the man in the chair sat forward, as if listening, his cigarette between his fingers. The moonlight fell full on his face. It was the young son, the hero of the hour. As he listened he threw away his cigarette. The Colonel also listened, and heard a soft step and the rustle of a dress, and, smiling to himself half-cynically, was about to retreat from the window that commanded the prospect. But his smile changed. Across the edge of the ghostly lawn, behind the chairs, a slender, dark figure came, and paused for a moment in the shadows by one of the creeper-clad pillars. It did not need the little hand, white and flashing in the moonshine, that was put up and pressed against the pillar to hold back a loose trail of creeper, to tell the Colonel who it was.

So the boy waited for his mother! They were one, mother and son. It was the old drama of thirty years ago repeated. He must turn away once again: he must go out of her life again; he had no place in it. And once again he looked down, in order to carry away with him clearly this last picture of all, in which, as of old, there should be two figures.

But what was this? The boy had risen eagerly, but it was not to meet his mother. She still stood, in her trailing robes, in the shadows behind him, one hand on the pillar. Round the gable of the house, as in that earliest picture of all, came one to the tryst. It was a young girl in white, one of the many pretty young girls of whom the room had been full to-night. And the boy took a step towards her and held out both his hands. She stopped short when she saw him, and stood irresolute; but he went quickly to her, and led her away, and together they went across the moonshine and the shadows, and past the colourless roses on the lawn.

Then the older woman came from behind the pillar and sank into the chair he had left. The diamonds she had donned in his honour flashed and gleamed on her bowed head and on her clasped hands; and it seemed to the man above her that they held imprisoned in their depths all the colours of all the jewels she had ever worn. But he knew from that bowed head and those clasped hands that she was weeping bitterly. And Colonel Everett, looking down at the lady of his dreams, saw a solitary figure, and knew that she—who had never had the love of her youth satisfied, and to whom therefore this son was son and lover in one—was suffering the sharpest pang she had yet been called upon to endure, for she was facing the knowledge that it was the turn of another generation.

And suddenly he knew that she was wrong—that it was *their* moment that had come, the moment for which all the sorrow, all the years, all the courage, all the self-surrender had perfected them. Let the boy and girl lovers wander moonstruck among the colourless roses! They knew nothing.

And this time he went down to meet the lady of his dreams.

THE MONTH: SCIENCE AND ARTS.

HYGIENIC BED-LINEN.

THE equipment of the bed constitutes one of the most perplexing problems to the housewife, since it involves the study not only of the requirements and tastes of varying constitutions, but also of fluctuating climatic and season conditions. There are many who, for physical reasons, are compelled to sleep between blankets the whole year round, a necessity which in summer is particularly trying owing to the weight and thickness of the covering, which is oppressive, not taking into consideration any irritation that may be caused by the nap. Even so far as concerns persons possessed of robust health extreme care has to be observed in the use of ordinary sheeting, since, although it will absorb perspiration, it becomes damp and clammy, and often sets up a severe chill. In the cases of invalids and delicate persons the difficulty is more complex. There are, however, many maladies, especially of a tropical nature, where the slightest appreciable weight during the fever-stage is keenly felt by the sufferer; and although sheeting is used to improve the comfort, it has to be supplemented by a blanket to prevent the chilling reaction of the former acting injuriously upon the high temperature of the patient. Moreover, such clothing, owing to the closeness of the weaving, acts as a clog upon the pores of the skin. Under these circumstances, the new sheeting that has recently been placed upon the market should meet with a warm appreciation; it is made in accordance with the aertex cellular principles, the efficiency of which in regard to underwear has long been established. These sheets are made in one seamless piece, and from their cellular construction, while acting as an excellent covering to the body, still afford complete ventilation to the skin. Furthermore, they are very light, so that their presence is barely perceptible, yet at the same time they impart a feeling of sufficient warmth without any oppression. No matter how soddened they may become by absorbing perspiration, they never produce a cold or clammy effect; in winter they never impart that shock experienced when one jumps between the linen sheets, and never convey any sense of dampness. From the medical point of view, owing to their hygienic system of construction, they are in great request, many of our largest hospitals being exclusively equipped therewith, particularly for use in fever and consumption cases. Experience has demonstrated their efficiency for the last-named scourge when the patients reach what is called the 'night sweat' stage. The excessive perspiration which will make the linen sheet wringing wet, necessitating its immediate removal to avoid striking cold to the sufferer, does not so affect the cellular fabric. The perspiration is absorbed but never chills; while, owing to the porosity of the material, it ensures the skin being efficiently ventilated without any ill effects. The ease with which they can be washed is also an important point, since boiling is obviated. For children's cots they are eminently adapted, especially for those of tender years who require a textile thin, light, soft, and yet warm. Taken all round, this application of the cellular principle of weaving marks the most important stride that has been made in the hygienic equipment of the *lit* since blankets and sheets were first adopted.

A SAFETY-LAMP.

Despite the wonderful strides that have been made in regard to the evolution of various mediums of illumination which are supplied in bulk from central supply stations, the lamp is still extensively used by the poorer classes of the community and in those rural districts where other systems are unavailable. That the employment of such an article is attended with grave dangers a perusal of the numerous fatalities directly attributable thereto strikingly shows. But the lamp will never become obsolete. Under these circumstances inventors are devoting their energies to the contrivance of a simple, inexpensive article which is absolutely safe under all and varying conditions, while attractive prizes are still available to stimulate the inventive faculty. But the safety-lamp has so far resisted discovery. In the meantime, however,

the nearest approach thereto has been achieved by a Scottish scientist, whose invention promises to come into extensive vogue. Though petroleum, one of the most inflammable liquids known, constitutes the lighting medium employed, its use is carried out upon such lines that explosion or fire arising therefrom is quite impossible. The lamp is, moreover, of simple design. It comprises a special porous stone which is immersed in the oil and becomes thoroughly saturated therewith. This absorbent medium has a hole pierced through its centre extending to the orifice where the wick is generally placed. The stone is placed in a metallic receptacle which is so devised that a current of air can circulate through the channel in the absorber. The burner is placed in the usual position, and carries an incandescent mantle. To light the lamp one simply places a burning match to the burner. This causes an upward draught of air, through the stone, which in its passage mixes with a small percentage of the gas of the petroleum, and the mantle becomes incandescent. So long as the latter is alight the upward draught of air continues, but directly the lamp is upset it is extinguished. It cannot explode by any possible means, since the proportion of light hydrocarbon with the air is so small, while directly the absorbent stone becomes exhausted the flame simply expires. There being no free liquid in the vessel, it cannot catch fire. So simple and safe is the lamp that a child can manage it with absolute safety. For country-house lighting it is an ideal and economical system. The lamp is supplied in a variety of styles usually associated with oil illumination, ranging from a few pence to several pounds in cost, so that every requirement is met. It has been adopted with complete success in the lighting of the residential quarters at Holyrood.

FALLACY OF BACTERIA-DESTRUCTION IN MILK BY REFRIGERATION.

A short time ago one of our leading physicians strongly advocated the preservation of milk at a low temperature in order to secure the destruction of the bacteria present. That such a system is fallacious actual scientific investigation has conclusively proved. A small quantity of ordinary clean milk as taken from the dairy was immersed in a refrigerator and reduced to freezing-point. In the course of five or six weeks the milk was found to be teeming with millions of bacteria in a healthy and flourishing condition. This multiplication occurred despite the fact that the milk was in a semi-solid state of ice-crystals, and when a portion was raised to normal temperature no evidence of contamination was apparent to either the smell or palate, while when boiled it did not curdle. This result is quite in harmony with the theories of science concerning the non-influence of intense cold upon the propagation of bacteria. In regard to the liquefaction of gases, it has been found that, notwithstanding the intense degree of cold attained, it exercises no militant effect upon these organisms. It is for this reason that the recent liquefaction of helium, which it is hoped will give us absolute zero, is of far-reaching interest. It is anticipated that the temperature will be so low as to be incapable of supporting life of any sort. Incidentally, however, it may be pointed out concerning the foregoing experiments with frozen milk that although it may taste sweet it does not follow that it is free from bacteria.

WATER STERILISED AT THE TAP.

Ozone is one of our most powerful oxidisers, and advantage has been taken of this fact in a novel manner in France. Drinking-water, though passed through a lengthy cycle of filtering and purifying operations, is yet extensively infested with micro-organisms. This latest development is the introduction of a certain quantity of the gas into the water at the tap, so that when drawn the liquid is to all intents and purposes perfectly sterile. The apparatus is very simple and inexpensive to install. Mounted on a small panel some fifteen inches square is a small ozoniser, comprising sheets of glass covered with tinfoil on one side, and freely perforated. A current of air is drawn through these plates, which is ozonised under the influence of the electric current. The ozonised air passes into an inverted glass bulb into which the water is thrown by the main pressure in the form of a spray, and accordingly it combines with the gas, which immediately seizes upon all bacteria present, oxidising or despatching them immediately. The water drawn from the tap is quite germ-proof, while the addition of the ozone imparts a delightful sparkle and an invigorating taste to the liquid. The apparatus is very economical in operation, the ozoniser merely being connected to the holder of an electric lamp, while the simple task of turning the tap sets the ozoniser in action, switching off the current when the supply is arrested. The electrical consumption is very small, one unit sufficing for the sterilising of a thousand gallons of water. Over a thousand of these sterilisers have been installed in private houses in Paris, and recently they have been introduced into this country. The system has also been extended to the purification of public supply installations, a huge plant having recently been completed for the sterilisation of the drinking-water of Nice before its entry into the distributing mains, capable of treating over five million gallons of water per day.

NEW DUST-LAYING MEDIUM.

The dust-fiend has now assumed such huge proportions not only on our roads but in our buildings that any practicable means of subjugating its baneful influences should be to the public advantage. Several specifics have been devised to achieve this desideratum, but they have only proved moderately successful; while the primitive methods of watering and distributing damp sawdust have proved not only expensive but practically useless. One medium, however, which experiments have shown to be

unusually efficacious has recently been introduced upon the market under the name of 'crempoid.' By its use wooden floors can be kept as clean as polished linoleum, while the atmosphere is also kept free from dangerous dust particles with comparatively little trouble and expense. The specific is in the form of a liquid, which is sparingly distributed over the floor. Its effect is to weigh all dust particles so that they cannot rise into the air by any means, but roll along the floor when a broom is applied, so that they can be easily collected and removed. As it is not requisite to rub the floor with the medium, application can be effected very quickly, while, when swept, the boards are left perfectly clean and the atmosphere dustless. It is also a powerful germicide. The liquid is mixed with about 80 per cent. of water, and when administered may be left on the floor for four or six weeks, according to the extent of the traffic. Under these circumstances, it is well adapted for use in warehouses, shops, public buildings, theatres, offices, and so forth, where the accumulation of dust entails considerable annual expenditure. Crempoid is already being extensively used in schools, libraries, &c., while the executive of the Edinburgh Exhibition employed it for the treatment of the floors in the machinery and industrial buildings, greatly to the satisfaction of the exhibitors. It has the distinct advantage that it has no injurious effects upon the most delicate materials used for ladies' dresses, should they trail upon the floor.

A NEW PRESERVATIVE BLUE-BLACK IRON-PAINT.

The buildings necessary for carrying out what will prove to be a new chemical industry in this country are approaching completion in the Midlands. Here the ingenious process discovered by Dr C. F. Wülffing for the production of a new and valuable blue-black paint for preserving iron will be commercially exploited. The value of this chemist's invention is that not only does it provide a new and highly valuable and inexpensive protective medium, but it is prepared from what has hitherto been practically a useless by-product from another manufacture—the hydrochloric acid pickle used for the preparation of iron plates for tinning. In the Welsh tin-plate trade two such pickles are used, one made of sulphuric and the other of hydrochloric acid. The first-named, after its primary work is completed, is employed in the production of copperas, but hitherto the last-named solution has defied commercial utilisation. Dr Wülffing, who resided for many years in the centre of the tin-plate industry in the Principality, turned his attention to the question, the scope of his idea being to precipitate the oxide of iron by a cheap and commercially practicable process. There are certain agents which can effect this end, but although the oxide of iron is obtained, the precipitating substance employed in itself becomes useless. It occurred to this chemist that ammonia might be profitably adopted, especially since not only would the iron oxide be secured, but the resultant ammonium chloride obtained from the process would be more valuable than the ammonia used. He experimented on these lines, and finally succeeded in discovering a means of carrying it out profitably and without any appreciable loss of ammonia—one of the most difficult objects to achieve, bearing in mind its volatile nature. The iron oxide obtained is of a beautiful blue-black colour, absolutely insoluble in water, of excellent quality, and chemically pure. The paint is made up by mixing the oxide with boiled linseed-oil. That it is an excellent preservative for ironwork has been proved conclusively. Structures which were treated therewith two years ago, and continually exposed to the varying weathers, have a surface as fresh, perfect, and as varnish-like as when first treated.

HANDY PLEATER FOR LAUNDRIES AND CLEANERS.

One of the latest demands of fickle fashion is for fine pleating of frills and flounces sent to the laundry or cleaner, so that the wearing apparel may be returned home with an appearance practically identical to that it possessed when new. Hitherto content has prevailed with goffering, which was comparatively simple; but to achieve a pleating effect without removing the flounces or frills was impracticable. As is known in goffering, the fabric has a corrugated appearance, the channels being of U shape, due to the type of appliance used. With the new machine, however, a perfect pleated frill is obtained exactly the same as when new. The machine is small and compact, and capable of taking a pleat up to three inches wide. By its aid the embellishment of a blouse can be repleated in a few seconds, and by means of a patented device the frill is cleared directly the operation is completed. Any part of the frill, no matter how difficult, can be inserted. The machine is simple in design and operation, so that it is not liable to get out of order easily. Heating is carried out with gas, and the cost of running does not exceed three-halfpence for a day of ten hours. Its initial cost also is trivial. With this appliance the artifices of the laundress are appreciably augmented, and the appearance of the garment distinctly improved.

A NEW ILLUMINATING GAS.

A recent development in Germany should offer great possibilities in this country. This is the supply of gas in cylinders adapted for the lighting of country houses and rural districts. The gas has been invented by Hermann Blau, a chemist, and is distilled from oil and other materials. Manufacture is carried out upon new and novel lines. The oil is fed into the retort and distilled at a lower temperature than that employed in coal-gas manufacture. The by-products are secured, and the gas cleaned and scrubbed in the usual manner. It is then compressed at great pressure in cylinders similar to those employed for the transportation of oxygen, the effect of this pressure being a lique-

faction of the gases. The permanent gases which distillation has yielded, such as hydrogen, methane, and carbon monoxide, the chief constituents of coal-gas, are then dissolved to the required extent in the liquid gases. When the pressure is relieved the liquid volatilises, carrying off a certain proportion of the gases which were dissolved. The light obtained is of great brilliancy, while the gas is perfectly pure and harmless. The cylinders are of varying lengths and capacity, it being possible to acquire a small vessel holding one pound of gas, suitable for travelling, boating, or camping-out expeditions, up to large reservoirs containing heavy supplies suitable for extensive country seats. The medium size, adapted for use in small villas, will supply enough gas to meet requirements for some eight weeks. All that it is necessary to do is to install the charged cylinder in the receptacle supplied for the purpose outside the building, connect it up to a small tank in which the pressure is regulated, and then admit it to the ordinary piping-system of the house. When a cylinder is empty it can be easily and quickly disconnected, and a full cylinder replaced, the empty one being returned to the works for a fresh charge. There is no possibility of explosion, and no technical knowledge is necessary for its manipulation. In Germany several villages are being lighted upon this system. The distributing mains are laid in the usual manner, though small pipes need only be used, and are connected up to a small hut in which the gas cylinders are placed. The only attention required is the changing of the cylinders as they become exhausted. The system is cheap, highly efficient, and free from danger, and even the smallest villages can become possessed of a complete gas-distribution plant at a nominal outlay.

THE LATEST TRAM-CAR.

An ingenious invention for saving much of the time now wasted at stopping-stations, and at the same time adding to the comfort and convenience of passengers, is engaging the favourable attention of tramway managers throughout the country. After many experiments with types of one kind or another, American and German among the number, something like finality has been reached regarding the general design of car best adapted to British conditions of traffic in the shape of the double-deck vehicle in practically universal use here. One great drawback remains, however, by reason of the employment of a single door for both incoming and outgoing passengers, frequently giving rise to much confusion when the contending streams meet, and invariably causing serious delays. All this is removed in the new design submitted by Mr Kavanagh, of Liverpool, who has worked out a completely effective plan whereby the back-end of the car may be utilised, as at present, for entrance, and the front for exit, or *vice versâ*, and also introduced a variety of other improvements in the way of safety staircases and other novel contrivances calculated to facilitate the handling of traffic. In order to meet Board of Trade conditions, Mr Kavanagh provides—by means of automatically working doors—an exit absolutely free from danger, no matter in which direction the car is running. This is, indeed, the main feature of the design, and represents in itself the solution of the problem which has hitherto stood in the way of the adoption of the separate entrance and exit idea, since the safe side when the tram is proceeding one way becomes the danger side when it is going in the opposite direction. By isolating the driver and covering in the whole of the top deck, an improved system of ventilation is made possible, and passengers are completely protected from wind and weather from the moment they enter until they actually step from the car. In time-saving alone it is calculated that at least five minutes can be gained on the average journey, which means a large economy in towns with hundreds of cars and thousands of journeys daily, and no small consideration even in less busy districts. Then the separate doors clearly make for a better distribution of passengers over the car, and consequently for more expeditious handling on the part of the conductor, whose duty as regards fare-collecting is much facilitated owing to being enabled to make a complete round of the car, top and bottom, without covering, as at present, the same ground twice. From the passenger's point of view the extra comfort implied by the abolition of the crushing and struggling, sometimes for entrance and sometimes for exit, must be sufficiently obvious to all who are in the habit of travelling by tram. The model in which Mr Kavanagh exhibits his system has been visited by many tramway experts and others, who have without exception pronounced it not merely a beautiful and skilfully built piece of workmanship, but the embodiment of a design which marks a highly important and thoroughly practical advance in tramway construction.

THE LABOURER.

The day is nearly done; the air, grown chill,
Shivers among the poplars straight and tall;
From the old oak that yellows on the hill
The ripen'd acorns fall.

Not yet the hour of rest. There, where the field
Lifts a sharp shoulder to the deep'ning blue,
Stoops the bent back of patient toil, to yield
Its daily labour due.

Silent and sure he works, but half-aware
That the world needs him, lacking all its praise;
One with the slow, sure seasons, with a share
In all their silent ways.

Day unto day repeats its equal tale,
Night after night returns—a welcome guest.
Lo! the moon rising, large and round and pale,
Heralds the hour of rest.

PEDRO THE MULETEER.

A SOUTH AMERICAN STORY.

By FRANK H. SHAW, F.R.A.S.

IN FOUR CHAPTERS.—CHAPTER I.

A LONG-DRAWN bellow that rose in a swelling crescendo and culminated in a shrill yell ripped through the hot afternoon, and the dozing labourers about the docks at Puerto Bianca smiled sleepily.

'It is the man Pedro,' they whispered to one another; 'the poor Pedro—he who works when men sleep. Wherefore Pedro is a mule himself, together with his four mules, which make five—Pedro, who is like *el Presidente*.'

Once again the frenzied howls bit through the sweltering day, and a scuffling accompaniment added to the din. One man who was half-awake drew up his bare feet closer against the side of the big warehouse. For Pedro stood not upon the order of his going; he drove his sweating, scrambling mules up hill and down dale, over a thousand obstacles and through rushing torrents that would have been impassable to any other man. For Pedro had an aim in life: that aim, to provide many little luxuries in the way of *maté* and *torcillas* for an aged dame who dwelt up the hills in the shade of a waving deodar. Wherefore he worked while men slept, for pesetas were hard to come by, and vanished with amazing swiftness when gained, what with *cigarettos* and *maté*, with a little game at cards and a trifle of sugar for the mules.

With a halloo and a higher scream than ever from the man, the shaky wagon with its team of four stout animals rushed at a mad pace round the corner of the warehouse, and Pedro reined in his beasts within an inch of a slumbering peon's feet. He tossed his reins on to the backs of the wheelers, and sprang to the ground without a look about him. On the wharf, recently disgorged from a yawning tramp steamer's holds, was a mighty stack of cases and bales, importations from Britain, and destined for the scattered *estancias* up-country. Without a word, save that he hummed cheerfully, the muleteer began to load his wagon with the goods, and his great muscles seemed to crack as he flung weight after staggering weight over the tail-board. No man offered a hand, for the *peons* of Puerto Bianca were given to spending their leisure in sleep. Pedro worked alone, and the great sweat-drops hopped down his beaming face as he toiled on. Once he paused to wring the gathered sweat from his shirt, and for three seconds by the old watch in his pocket he allowed himself the luxury of a fanning with his sun-scorched sombrero, but the last tick of the three moments had hardly gone when he was at his task again.

'They make them heavier towards the end,' he grunted philosophically to the off-leader of his team—a mighty animal with the grace of an Arab horse and the strength of a traction-engine. But *El Lopos*, which being interpreted means The Wolf, made no answer beyond a choking scream, and lashed out with his heels. Well was he named The Wolf, for he bared his teeth to the tops of the red gums, and made a playful snatch at his master's shoulder as Pedro turned again to the bales.

'Back, pig!' shouted the muleteer without anger, striking the offender on the leathery muzzle. 'See, infidel, thou hast kicked the skin off *La Dolores*, thy sister! Pa! a hulking pig of a mule!'

The wagon was full and doubly full, and Pedro paused again. From his waistband he produced a packet of maize-leaves and a pinch of powdery tobacco. He rolled two *cigarettos*, one of which he stuck behind his ear pen-fashion; the other he kindled, and inhaled appetising gusts of smoke. Then he sprang upon the wagon-top, lifted the reins, and his shrill yell commenced anew.

The ill-paved roadway was a lurking danger to the tough wheeled cart. The railway lines gaped

 [*All Rights Reserved.*]

widely at the points, and The Wolf caught one lashing hoof in the cruel gap. He struggled madly, lost his footing, and fell across the track just as a loud-clanging bell denoted the approach of the shunting pony-engine that careered wildly along the dock-side.

'Get up, thou pig!' commanded Pedro, as he touched the ground at the screaming animal's head. He had sprung at one leap from the cart to the fallen animal's head, and was now laying on his quirt with all his strength. The Wolf made strenuous efforts to rise, but his hoof was held as in a vice. Then Pedro bowed his mighty shoulders to the work. In the midst of a sweeping hurricane of lashing blows from the free hoofs, he bent and seized the imprisoned foot. Once he heaved, and his shoulders creaked ominously. Twice he heaved, and the imprisoned foot came out with a rush, so that Pedro measured his length on the road. A circular gash on his forehead told where one at least of The Wolf's kicks had got home.

'Now, *holà!* up, pig!' and the quirt lashed out anew. The Wolf reeled to his feet and stood trembling, to be dragged out of the way by the head as the clanking pony-engine whizzed past to the accompaniment of a torrent of oaths from the engineers.

'Pedro has the strength of a bull,' exclaimed the watching *peons* as cart and driver vanished round the corner at a break-neck pace. 'No ten men could have dragged The Wolf's foot from that impasse. We know it; it clutches like Death himself.'

Racing madly round sharp corners, missing by a hair's-breadth the speeding tram-cars as they spun through the narrow streets within a foot of the pavement, into the very heart of the city Pedro drove; and as he went he sang to himself, for he had done a good day's work. It meant much *yerbe maté* for the aged woman up the hills.

A mounted *vigilante* gave him the time of day and a word of warning in the same breath; and, obedient to the latter, Pedro checked his headlong career for just long enough to enable him to pass out of the policeman's observation. Then, with a yell and a crack of the deadly quirt, he settled again to his furious pace. The springless cart bounded like a ball from the rough cobble-stones of the road; the cases and crates danced a devils' dance up and down; the snorting mules panted and quivered to the weight; but soon the stately rows of buildings gave place to rich avenues of trees, scattered here and there with cavaliers and ladies, until the open country was reached, and the road glared dazzlingly white under the noonday sun.

The road began to slope uphill at a sharp incline, but Pedro did not check his onward career. Instead, working himself into a perfect frenzy, he shrieked and yelled to his animals, while the squirming whip curled in resonant loops about the leaders' ears, so that the first two hundred yards of the slope was taken at a mad gallop. Presently, however, the struggling mules were reined in, and Pedro rolled himself another cigarette.

He sat listlessly on the front of the cart as he smoked it. His hands drooped inertly from his wrists, his heavy hat was thrust back from his brow, and his dusky beauty was fully revealed in the glaring light of the full day. Undoubtedly he was a handsome man, fit to pose as a model for a statue of Apollo Belvedere, as the firm round column of his throat rose in muscular perfection from the open collar of his spotless shirt. His great breadth of chest was scarcely apparent in his indolent attitude; but the swell of his mighty biceps was plainly to be discerned under the loose white sleeves, and his great hands had the appearance of a grip that would never relax until death claimed its own. In repose his face was almost melancholy, for he carried the true Spanish type of beauty, which depends more on its expression than on its actual features. It was not until some pleasant memory crossed his simple mind that the brooding eyes lit up with a gay sparkle, the long moustache curled up under his nose, and his cheeks wrinkled merrily. When Pedro smiled the girls of the roadside *posadas* stopped to chatter, and when he went his way, with a careless jest or an utter disregard of their inviting glances, they sighed, for they said he was a king among men.

And yet, in all his thirty years, he had never felt his heart quicken by a single beat at the smile of any woman save his mother. His hot blood was almost boiling in his Southern veins, but all the affection of his strong heart was lavished without stint on the aged mother in the hills. His tenderest smiles were for her; his few thoughts were of her alone. And she—she worshipped her handsome son with a mad worship that was half-jealousy and half-pride.

The white road wound sinuously up from the sun-baked plains into the torrid hills. A few dusty cactus-plants grew at the roadside, but there was nothing green in all the land. The heat lay in a quivering haze over the scorching rocks and the arid soil; it burned up every blade of grass and withered every flower; and the hot dust parched the muleteer's throat to madness, so that he drew his mules to the roadside as he reached a lonely *posada*, and called humbly for wine. It was brought to him in a mighty beaker, and the serving-girl would have dallied coyly to watch him drink—and would have considered herself well paid for the draught by a single kiss; but he had eyes for nothing save the city on the plain behind. As he looked over the swaying landscape his eyes were attracted by a sudden flame of dazzling white. He smiled sadly and shrugged his shoulders.

'What then, Pedro?'

'It is nothing, Juanita. I see the white wall where they shoot the presidents, that is all. It is now seven months since there was a revolution, and the wall is white as snow. I have seen it splashed

with red as high as a man's shoulder. Blessed be the peace, I say.'

The girl tossed her head saucily. Her big Southern eyes were revelling in Pedro's beauty, but he was all-unheeding.

'Nay, then, I love the war, Pedro. For then the soldiers come up the hills, and they are men who love a jest, these soldiers. They have eyes for a pretty face and a pair of ripe lips, these soldiers, *amigo mio*.'

'Ay, and for a wine-bottle. But I have noticed they look the other way when payment is due. *Buenos tardi*, Juanita.'

'Go with God,' she replied, with the common salutation of the land; and as the road was now level, Pedro sprang to his seat with one bound and yelled himself into a lather of sweat. The mules sprang forward with a rush, but before a mile had been traversed The Wolf checked in his stride and came to a limping halt.

'What ails thee, pig?' cried Pedro, dismounting and approaching the leader. 'Ah! blood on thy hoof. So, it was torn in the city? I will examine the mischief.'

He knelt incautiously at the mule's heels and passed his hand over the wounded part. Had he not so handled The Wolf for every year of his short life? There was no danger, for the mules loved him well. But the acute pain had driven the recollection of a thousand caresses from The Wolf's brain, and when the hand touched a gaping wound in his fetlock he lashed out savagely with his unhurt hoof and laid Pedro in the dust.

'*Diavolo!*' muttered Pedro. 'Be still, accursed one!' But the mule was wild with pain, and when his master approached once more he lifted his hoof deliberately and kicked him with savage strength just under the ear. Then the world went out in flames of fire, and Pedro knew nothing of the stampeding team and the roadway littered with broken cases as the cargo jolted from the wagon.

His forehead was wet and cool when he awoke again, and he put up a listless hand to brush away the drops. Then he looked at his fingers curiously, but there was no blood on them—nothing, indeed, but a few drops of chilly water. In surprise he lifted his eyes to a vague shadow that lay between himself and the sunlight. It was not often wayfarers passed on the hill-road, seldom that any stopped to inquire into the case of a stunned muleteer. The passers-by knew only too well that feigned stupor might simply be a ruse to entice them to their destruction. But here was somebody bending over him, and whispering words in a most entrancing voice. Pedro raised himself on one elbow, and looked earnestly into the most beautiful face he had ever seen.

'So, it is better—no?' asked the slim girl who was bathing his aching brow. 'The heat of the sun on an uncovered head, was it not? Or too much wine at the last *posada*?'

The muleteer attempted indignantly to repudiate the statement, but found himself curiously listening for his own voice, which would not come to his aid. So he put his hand up to his ear, and then heard a faint scream.

'Who has done this evil?' asked the dulcet tones again; but Pedro merely wagged one finger knowingly, and his face broke into a gay smile.

'It was—The—Wolf,' he said at length sleepily; 'he is surely accursed.' Thereafter he let himself fall back in easeful inanition, for it was surely good that such a vision of loveliness should stoop to tend him—Pedro the silent one. After long minutes had passed, it percolated to his consciousness that he was not yet dead and in heaven, in the presence of the angels, but that he lay in the middle of the hard road, and that a girl, clad in shimmering white silk, with a mantilla thrown back from her face, was regarding him with grave eyes. His inherent gallantry came to his aid, and he essayed to rise.

'It is not fitting,' he said huskily, 'that a great lady should stoop to tend one of the people. *Madonna mia*, but the beauty of her is as the stars of night!'

She affected not to have heard his last words, and smiled encouragingly. 'You are afflicted and helpless,' she said briefly; 'that is enough for me. So, now, can you rise?'

He arose with the assistance of her arm, and staggered drunkenly to the side of the road, where a rock formed a convenient seat. As he sat down giddily, clutching at the steadying hand, he became aware that a luxurious carriage stood at some little distance, and his eyes widened.

'The wife of the President?' he asked unbelievingly. 'Madonna, but I should have known! No, *Excellenzia*, I am again well and strong. The blow? Poof! it is nothing. I am used to such; but it is surely wrong that you should kneel in the dust at my feet.'

He remembered her more clearly now, and the tender look of pity in her eyes made his heart leap wildly. He had seen her in her state carriage less than seven months before, riding at the side of her husband the President; and he had been taken with the determined set of her shoulders and the carriage of the dainty head. 'Yes,' he murmured in drowsy content, 'it is she assuredly. It is well to be Pedro and wounded.'

She laid her wet handkerchief across the wound on his temple, and he bent humbly to kiss her hand. It was a strong, capable hand, he noticed, one formed for such acts of mercy as these. But he threw off the lassitude that was claiming his senses again, and stood erect once more.

'You will permit me to lead you to your carriage, *Excellenzia?*' he said gravely; and, seeing that he would not be denied, she assented. He handed her into the softly cushioned vehicle with all the grace of a cavalier of Old Spain, and stood, his head bared to the scorching sun, his eyes drooped to the dust, as she drove away with a gay wave of the hand. Then, when the carriage had disappeared in a golden haze, he struck himself on the breast.

'I was right,' he said simply; 'she is indeed one

of God's angels. And she tended me. Pedro, that is a debt to be repaid some day.'

He hobbled painfully back to the *posada* he had left, and made arrangements for his conveyance to his home. On the way he came up with his runaway team, feeding unconcernedly on a few scraps of alfalfa grass at the roadside, with the reins hanging about their feet. He dismounted from the cart in which he was seated, and ran to his mules.

'Oats in plenty and a blanket to thee, my Wolf,' he cried to the cause of his catastrophe, 'for thou hast shown me an angel of heaven.'

Thereafter began a long period of glorious dreaming for the muleteer. His chivalrous soul surrounded his remembrance of his succouring friend with a roseate glow; he deified her; he loitered about the Government Palace for long hours in the cool of the day, hoping that he might catch a glimpse of the girl who had taken compassion upon him in his pain.

'For she saved my life,' he explained to his mother simply when she chided him for his abstraction; 'had she not stayed to aid me the men of the mountains would have slit my throat for the sake of the few pesos I carried.'

'She has forgotten thee, of a surety, Pedro mio,' said the old dame mumblingly; 'why then, be a man. The stars are overfar above us; and she will know thee not again.'

But Pedro fed upon his worship, so that daily he grew more desirous to serve his goddess. He loved her, not with an earthly passion, indeed, but as he might have loved some radiant vision from the skies who had smiled down on him upon the sordid earth. And his mother seemed to understand, for when she noticed that the saint's picture in the little recess in Pedro's room was gone from its frame, and that a gaudily coloured portrait of the President's wife had taken its place, she said nothing, even though a chance gust of mountain wind once blew aside the curtain and showed her son bowed in reverence before his new shrine. Morning and night Pedro said his orisons with a simple faith to the reproduction of his wonderful vision, and grew in happiness with every passing day.

(To be continued.)

DO WE EAT TOO MUCH?

By Frederick A. Talbot.

PROBABLY at no period during man's history has the question of diet become so acute or so strenuously debated as at the present day. The crank and the faddist, like the poor, are always with us, but their pronunciations either for or against count for nought. On the other hand, the community has split itself into numerous camps, each of which has initiated its own tenets as to the proper laws of feeding, and by proudly pointing out one or two members of its particular coterie who, having attained a ripe old age, are hale and hearty, in possession of all or at any rate the most useful of their faculties, steadfastly assert that such examples substantiate incontrovertibly the fact that their mode of diet is that which is the most correct and in consonance with the laws of nature. But a little reflection soon tends to prove that any such examples only serve to uphold the old-time axiom that 'the exception proves the rule.' The greater proportion of the community, who pursue the even tenor of their way in regard to the science of diet, in reply to the foregoing arguments produce hundreds of beings who, never having given a thought to the question nor attempted to effect their feeding upon any methodical basis, have yet managed to reach twenty years or more beyond the allotted span of life. The result is that neither one nor the other is convinced, and consequently the battle continues.

Yet, at the same time, the advocate of either of the various dietary camps, or the average member of the larger community who does not pay much attention to such a question, has but a slight idea of either the design or functions of the human body. In reality it is a complex, beautiful piece of mechanism, requiring as much nursing and care as a steam-boiler. If the latter is improperly pulled with fuel it fails to work, while if overstoked a severe breakdown or disaster is precipitated; similarly, if improper fuel is used the working is spasmodic and unsatisfactory. At the same time in the hands of the amateur it is apt to play strange caprices which invariably have but one determination—irretrievable ruin. It is the same with the human body. It is so delicately constructed that it is much more susceptible to break down than the prosaic steam-boiler. If insufficiently nourished the thousand and one organisms constituting the complete machine fail to work up to their normal level, and if overfed the mechanism becomes clogged and unable to act, resulting in a complete collapse of the whole fabric, which can only be repaired by the judicious stimulating of the various organisms in the hope of restoring them to their correct balance. Then, again, improper feeding, while it may be adequate to maintain the human machine in running order for a time, invariably terminates in a collapse when any undue strain is imposed, and unless the harmonious development of the composite organs and tissues is quickly restored serious disaster is in store.

It is a well-known fact that quack dietary is more responsible for the early failure of the organic structure than underfeeding or overfeeding. The

reason is that the bodily activity is forced up to a high pressure, which it is able to maintain for a time; but the cells of the frame, upon whose extraordinary power of rehabilitation life is entirely dependent, being unable to withstand the strain, succumb. With correct nourishment the possibility of such a contingency arising is diminished, but it is the lack of knowledge upon this vital point which propagates many of the ills to which mortal flesh is said to be the heir. This deficiency, however, may be repaired by a perusal of Dr Chittenden's recent volume, *The Nutrition of Man* (Heinemann), which is the most exhaustively informative work upon the stoking of the human furnace that has appeared within recent years. The author is an advocate of no particular system other than that required by discriminating Nature herself; he holds no brief for or against any particular dietary system. He has only investigated the subject from the unbiassed and stern physiological science points of view, and the result of his researches admirably enlightens us upon a salient point, and serves to elucidate many of the problems of feeding which have hitherto been in a more or less chaotic condition. The work is not a mere scientific hypothesis or ethical digression, but embodies the results of actual experiments with human beings and animals purposely carried out to prove or disprove the contentions of former investigators and to unravel the many debatable points which they left in mystery.

The process of sustaining life is a chemical one; that is to say, the food you eat undergoes three distinct chemical actions: disintegration, decomposition, and oxidation, by which is evolved the requisite energy to maintain the heat of the body and the power for mental and physical effort. You partake of your meal, and the ensuing digestion of the same is the common expression of this chemical change. At the same time, the various articles you eat are or should be resolved into three fundamental constituents: proteids or albuminous food-stuffs, carbohydrates, and fats. The first are the most essential. In composition they comprise on the average 52 per cent. of carbon, 7 per cent. of hydrogen, 23 per cent. of oxygen, and from 1·5 to 2 per cent. of sulphur. Without partaking of proteids it would be impossible to support life, since they provide the material for the reconstruction of all the cells. The eminent scientist Liebig went much farther. He contended that proteids or nitrogenous food-stuffs constituted the real source of energy. Consequently many so-called food-experts, on the strength of this assertion, and not troubling to ascertain whether the argument was subject to controversion, developed into proteid cranks, and with the eminent testimony at their command soon gathered together a large following. But subsequent investigation upon the part of the scientific world has disproved Liebig's assertion. Nature is not so easily gratified. Although she demands a definite form of nitrogen, at the same time she seeks for its combination with some other elements to maintain the rhythm of physiological evolution. Hence the need for the carbohydrates and fats. The first-named include the two closely allied compounds sugars and starches. These substances are absolutely free from nitrogen; the other gas, oxygen, being the predominating element, which exists in the proportion of 49·4 per cent., followed by carbon 44·4 per cent., and hydrogen 6·2 per cent. It is obvious that the absence of nitrogen precludes any possibility of the carbohydrates serving as cell-builders, but at the same time they perform another vital function. By oxidation they yield energy for the heat of the body and muscular effort. The fats, though also without nitrogen, have a greater proportion of carbon, which aggregates 76·5 per cent. The fats thus, as it were, constitute an auxiliary to the carbohydrates for the furnishing of heat, since they are less oxidisable than sugars and starches, and require a larger supply of oxygen to secure their combustion. Thus the three natural food-stuffs perform two allotted tasks: the proteids serve as tissue-builders essentially, though capable of providing by oxidation a certain amount of energy for heat and work; but the carbohydrates and fats are required for no other specific purpose than as a fuel to the bodily machinery.

Under these circumstances, then, what constitutes the ideal diet? Certain standards have been drawn up in which the proportion of proteids is adjusted to the percentages of carbohydrates and fats, the proteid being about a fifth of the carbohydrates, and fat about half of the proteid in bulk, for a man of about eleven stone in weight and performing a moderate amount of work. In this respect Dr Chittenden states that 'my own conception of the true food-requirements of the body has been expressed in the statement that man needs of proteid, fats, and carbohydrates sufficient to establish and maintain physiological and nitrogen equilibrium sufficient to keep up that strength of body and mind that is essential to good health, to maintain the highest degree of physical and mental activity with the smallest amount of friction and the least expenditure of energy, and to preserve and heighten, if possible, the ordinary resistance of the body to disease-germs. The smallest amount of food that will accomplish these ends is, I think, the ideal diet.'

After all, however, no hard-and-fast rule can be laid down as to how much we should eat; but it is an incontrovertible fact that the majority of us eat too much. It is purely a question of environment, occupation, and circumstances. It is obvious that the man who follows an active calling involving the expenditure of much muscular energy requires a greater proportion of heat and energy yielding food-stuffs—that is, carbohydrates and fats—than the man who leads a sedentary life, while similarly the man of light weight needs less proteid than his heavier confrère. At the same time, simplicity in dietetic habits ensures a higher level of perfect

health. As, however, the limits of our financial resources extend we are apt in a single meal to partake of a wider range of edibles in a greater variety of forms than formerly. What is the result? The production of maladies such as indigestion, dyspepsia, and other kindred complaints, the cure of which is only possible by a return to the more simple and plainer foods. Neither habit nor instinct affords us any criterion as to how much the body requires to maintain equilibrium, since such results are influenced by the caprices of the palate. It is a curious though noteworthy circumstance that in one dietary article the three necessary constituents incidental to the support of life are found, and that, too, in relatively large quantities—that article being milk, the natural food of young life and of the invalid, in which the assimilation of large proportions of proteid is imperative to meet the demands for material in the construction of the tissues and cells.

For the purpose of practical experiment, Dr Chittenden selected a company of thirteen men from the hospital corps of the United States army, and they were kept under surveillance for the purposes of the test for a period of six months. Well-trained cooks and assistants were available, together with every facility for the preparation of the food, which was carefully weighed before being given to the subjects. Regularity of life was insisted upon, while the men had to perform their usual duties. In their case their ordinary food was rich in proteid, especially in meat. Throughout the period of test a daily dietary was drawn up, the composition of every comestible known, and the nitrogen content of each day's ration so graded as to bring about a gradual reduction in the quantity of proteid ingested, while every test was made to ascertain if the men were in a state of nitrogen equilibrium. The meals were of a very varied character, and although the quantity of meat was greatly reduced it was not entirely eliminated. Simple foods only were used. The amount of proteid food consumed by each man per day averaged about one-third of his accustomed quantity. Now, if this small proportion were insufficient for the sustenance of the physiological equilibrium, evidences of the fact would be bound to be manifested by at any rate one or two of the subjects, since there would result a diminishing of the body-weight, showing that Nature was drawing upon her available reserves to compensate for the insufficient quantities of food administered. Out of the thirteen men five either retained their weight during the test or made a slight gain; four others lost slightly, the falling off occurring within the first few days of the experiment; while two others lost more appreciably, also in the first stages. In these last two instances, however, the loss in weight did not detract in any way from the subjects' muscular appearance. The greatest reduction in weight was in the case of one man who lost practically eighteen and a half pounds during the period; but in view of the fact that he was somewhat stout, the change of diet, combined with hard work in the gymnasium, caused a loss which was beneficial rather than otherwise.

The sum of this experiment was that mankind is capable of maintaining nitrogen equilibrium with a far lower percentage of proteid food than that generally prescribed by dietary standards, with a corresponding improvement in the general health. Nor is the muscular energy impaired in any way by such restriction, since in this case at the end of six months the men all showed a phenomenal gain in strength, a factor totally unexpected and partially due to the change in diet.

In another experiment the subjects were eight athletes who were 'in constant practice and in the pink of condition,' and who were in 'training form' when the experiment was commenced. During the six months' test their daily allowance of proteid food was reduced 50 per cent. Yet at the end of the period every man had attained increased strength, thus testifying conclusively that prolonged low-proteid diet had not affected progressive muscular development and the attainment of a high degree of muscular strength. What does such a result show? Simply that 'the normal requirements of the body under which health, strength, and maximum efficiency are best maintained are on a far lower level than the ordinary practices of mankind would lead one to believe.' This is diametrically opposed to the general contention which favours rather a diet rich in proteid. Moreover, in the case of these athletes, after they had become accustomed to the dietary change they found that they could carry out their work with less fatigue.

While, then, proteid is imperative to keep the human furnace going, it is very evident that its proportion must be kept within limits owing to the fundamental action of the nitrogenous food-stuffs being merely for the building up and rehabilitation of the cells and tissues. An excess of proteid brings in its train a long line of maladies, and the thesis of Liebig that proteid furnished the most important portion of the energy requisite for physical effort has been once and for all exploded. It is quite safe to say that the greater proportion of our maladies—such as liver troubles, biliousness, gout, indigestion—are entirely attributable to excessive eating of rich proteid foods. Mankind, being an omnivorous creature, must steer his way perforcedly through the channel between the carnivorous animals which require a high proteid diet and the herbivorous class which thrive upon a very low proteid food. On the other hand, the demands made upon the system in order to furnish the energy necessary for any physical exertion are more advantageously met by consumption of the non-nitrogenous foods—the carbohydrates and fats. Muscular activity does not require stoking with proteid fuel. Yet care must be exercised to avoid underfeeding, since penalties arise from insufficiency as readily as from

excess. A perusal of Dr Chittenden's momentous volume will lay bare the evil effects of both in all their nakedness. Incidentally it will serve to show many who suffer from either one or the other cause how to avoid their accentuation if not bring about their elimination entirely. The work will emphasise, if nothing else, the necessity of a simple and temperate diet as affording the best health, combined with the maximum of muscular energy, activity, and efficiency, and will solve many of the problems incidental to present-day living. The life we follow is no doubt very artificial; Nature is being kept at a point of high pressure, and we must pay the penalty for such liberties. How to prevent the human machine from deteriorating, how to keep it at the highest pitch of efficiency, and at less expense to the household than at present prevails, this book will show.

CASIMIR LE SOMBRE.

By Lady Rollston.

CHAPTER IX.

WE travelled slowly, following the least-frequented roads, and it was near noon when we approached my home.

Being anxious to prepare Deotima for the meeting with her brother, I halted the escort in the forest, and proceeded to the castle on foot by a path which avoided the principal entrance and led round to the Countess's garden, for I knew that at this season the glass door of the library was seldom fastened, and that I might thus perhaps gain access to my friend unperceived.

Nor was I disappointed. As I sprang lightly up the iron staircase the swelling notes of the organ fell on my ear; and, pausing on the threshold, I beheld Deotima sitting before it with her fingers straying gently over the keys, and her fair head and shoulders bathed in a flood of mellow light which poured through the richly painted glass in a thousand rainbow tints, here gleaming on the ancient gilding of the organ, there broken by the heavy carving of the bookcases, but everywhere falling lovingly around her, and throwing out her dark, graceful figure in bold relief.

She was playing a sad, sweet meditation by Bach, which was a great favourite with her husband, and I was glad to notice this, as it was long since she had touched the instrument, and I thought that though its deep, tender tones might bring tears to her eyes, they would surely also bring comfort and relief to her troubled spirit.

Entering the room, I ran forward to embrace her; but, to my surprise, she sprang from her seat, and drawing herself to her full height, asked who I was and what I wanted.

In the pleasure of seeing her again I had quite forgotten my change of dress, and I was secretly glad to find that the disguise was so complete, and that she who knew me best took me for a stranger.

But it would have been cruel to keep her in suspense; so, holding out my hands, I cried reproachfully, 'Do you not know me, Deotima? It is I, Gabrielle.' And in another moment she was in my arms.

'My brother!—tell me of him,' she said, at last releasing herself and searching my face with anxious eyes.

'He is safe. I left him not long since.'

'Ah, but you look sad; he is wounded—perhaps dying,' she added with quick intuition. 'Oh, do not deceive me!'

'My darling, I will not do so;' and I told her briefly the events of the past day.

'And now,' I said, 'you must be brave and prepare for the journey. Let no one know that you are going but old Karl; he can be trusted, and will get the carriage ready. What money and jewels you have take with you, but as little luggage as possible, for we must travel fast, and the sooner you can get medical aid for your brother the better it will be for him.'

These words acted like a charm, and she dried her tears and proceeded quietly and swiftly to make the necessary preparations with that wonderful self-control that I have often noticed in Polish women, and which is born of the many trials to which they are exposed.

In less than an hour the carriage was at the door, and leaping on the driver's seat, I took the reins in my hands. Some of the waiting-women stared at seeing their mistress going off with a stranger, and old Karl peered at me very keenly from under his shaggy brows; but whether he recognised me or not he made no remark, and turning to the maids, ordered them sharply to go indoors and attend to their work. Then I cracked the whip, and we were soon lost in the forest.

The meeting of Deotima and her brother was a very touching one, for he had been an exile for many years; but we had little time to spare, and he was soon transferred from his jolting cart to the more comfortable carriage, after which we started at a brisk pace for the frontier.

That night we halted to rest at a small, out-of-the-way hamlet in the midst of the forest, and it was early on the following morning when we at length caught sight of the black-and-white Prussian colours on the telegraph-posts of the railway, and knew that our journey was over.

A few Custom-House officers ran out of a little

hut to stop the carriage, but prudently halted at sight of the drawn sabres of my troop. I dismounted, and taking the principal official by the arm, led him back into his office, where a conversation took place between us, in the course of which I managed to slip a heavy purse of gold into his not reluctant hand, and extracted a promise, after some grumbling, that he and his men would keep their eyes conveniently shut to the irregularity of our proceedings, and signal the train to stop and take up my companions. Then, withdrawing my troop into the forest where they could watch the line without being seen, I got into the carriage and waited.

My own French passport, with another that the colonel had procured before entering Poland, was properly vised so as to enable Deotima to reach Berlin in the character of a French lady travelling with her invalid brother; and before placing her in the train I gave into her hands a small russia-leather bag containing the Czartoryska diamonds. Then I bade her adieu with a formal military salute. It was a sore parting, for Deotima was in despair at my resolution to remain behind; but, not to betray my disguise, we had to control our feelings, and no one knew what was passing in our hearts. At last the whistle sounded, the wheels creaked, a white hand waved for a moment at the window, and I turned back to join my troop—alone!

CHAPTER X.

HOW dreadfully alone I felt, severed from all womanly companionship, and turning back into an enemy's country to take command of a band of reckless insurgents, you can readily understand; and for some time I rode sadly and silently at the head of my troop, with difficulty keeping back the tears that *would* force themselves to my eyes.

My reverie was rudely broken by the troop-sergeant, a brandy-drinking old soldier who had served in many armies, laying his hand on my arm and saying in a voice meant to be kindly, but husky from past potations, 'Young captain, you look sad; a slight tenderness in that direction, eh?' and he jerked his thumb towards the frontier. 'Well, she was pretty enough to excuse it. But cheer up, sir; there are as good fish in the sea as ever came out of it. *A la guerre comme à la guerre* is my motto, and I have been a soldier these forty years, though I am only a poor sergeant still. Why, when I was your age—*dix milles tonnerres!* but I could tell you such stories.'

I started violently. Was I, by joining my fortunes to the Polish cause, to degrade myself into becoming the boon-companion of every roistering trooper who might choose to din his ribald oaths in my ears? No, that must *never* be; and, turning on the man a look of the coldest scorn, I said in a voice which even to me sounded strangely harsh, 'Sergeant Dzikowski, listen to me. Your duty is to obey your officer, not to tell him stories. Fall back at once, and order two men to the front as an advanced guard; yourself follow in the rear with two more. Do you hear?'

'No offence, captain,' said the man, saluting sulkily, 'but you know that we *powstancy* relax our discipline on the line of march.'

'And if you did not you would give a better account of the enemy,' I replied sternly. 'Away with you!'

As the abashed sergeant fell back I heard him whisper to a comrade, 'Our young captain can fight, but he has the temper of a demon. Why, I only just opened my mouth, and he nearly snapped my head off. Silence in the ranks there! You are like a set of chattering magpies.'

This incident made me think deeply. It was clear that if I was to retain my command and my self-respect I must check all friendly advances on the part of my comrades that might lead to familiarity, or sternly restrict my communication with them to matters of duty. So rigidly did I afterwards adhere to this resolution that often when I passed among the camp-fires the men would whisper to each other, 'Hush! here comes the young captain; he does not like our idle talk. And thus I acquired the name of Casimir le Sombre.

I had spurred my horse ahead of my party, trying in vain to outride my troubled thoughts, when the tones of a violin fell sweetly on my ears, and I saw a young man of pleasant appearance sitting under a tree plying his bow vigorously. He was poorly dressed, but had a certain air of refinement about his face and figure that seemed at variance with the meanness of his apparel. As I approached he rose, and, lifting his hat politely, said in French, 'From the White Eagle on your cap I conjecture, sir, that you belong to the national army. Can you tell me where I shall find an officer in command? I wish to offer myself as a volunteer.'

His voice went to my heart and aroused pleasant reminiscences of home, for it had a ring of my own Alsatian accent; but I was still so soured by Sergeant Dzikowski that I replied coldly, almost rudely, 'The nearest regiment of *powstancy* is under my command; but it strikes me, sir, the instrument you carry will hardly be of much use to the national cause.'

'And yet,' said he good-humouredly, as he tenderly enveloped his fiddle in a green bag, 'it has enabled me to cross the frontier unsuspected, and has often beguiled the tedium of my journey. Do you know, my indignation was so aroused at what I read of the wrongs of Poland that I have come all the way from Alsace to join your cause. I am a soldier's son, and have been through a military school.'

'Indeed! May I ask your name?'

'Maurice St Hilaire.'

'Not the son of Colonel St Hilaire of the Old Guard?' I cried, recognising the name of one of my father's comrades.

'The same. Did you know him? But no, you are too young.'

This speech grated on my then state of feelings—for why should I always be treated as so young?—and I answered briefly:

'I have heard of him, that is all. However, as you have been through a school, I will for the present attach you to my staff; but you must remember that if you join me there are two things I require of my followers.'

'May I ask what they are?'

'Entire devotion to duty and implicit obedience.'

He raised his hand to his forehead in military fashion, without saying a word.

'Very well; you will now have to share a horse with one of my men. When we reach the camp I will give you further orders.—Sergeant Dzikowski, take this young gentleman up behind you.' And I rode on.

Early on the following day we reached the camp, and Father Ambrose took leave of me, promising, however, that he would keep a constant watch over my movements, and follow the regiment from place to place whenever it was possible, so that I might feel that I had a friend near me in case of need.

CHAPTER XI.

DURING the next few months we were engaged in a constant series of skirmishes with the Russians, a sort of guerilla warfare in which we were often attacked by overwhelming numbers and forced to retreat to the deepest recesses of the forest, but always managed to elude our pursuers, and re-emerge at some unexpected point to deliver a counter-attack when opportunity offered. Our object was to prolong the campaign in the hope that we should at last receive succour from some friendly Power, and be able to unite our forces for a great final effort—a hope which, alas! was never realised.

During all this stirring time of forced marches, night bivouacs in the forest, and ever-present danger, Maurice St Hilaire was the life and soul of the camp. Often, as I sat solitary in my little shelter of pine-boughs, would the notes of his fiddle reach me pleasantly from the camp-fire, cheering my drooping spirits or soothing my overstrained nerves to rest; while in the fight he was always at my side, striving to be abreast of me in the charge, and sometimes vexing me by throwing himself between me and the enemy.

The reckless gallantry and cheery spirits of this blue-eyed boy—for he was little more—won their way to my heart, and a feeling that he was my own countryman and from my native canton made the tones of his clear, frank voice peculiarly sweet to my ears. But I adhered strictly to my resolve, and held rigidly aloof from all intercourse with him, as with the others, except on matters of duty.

Notwithstanding my cold and reserved manner, he seemed to conceive a strong liking for me, and was never tired of trying to win my regard by acts of kindness and devotion, though his sense of discipline prevented him from attempting to force an intimacy which he knew that I shunned.

Once, indeed, he asked me gently why I refused to accord him a friendship which he said he had hoped would be all the closer that we were both strangers in a foreign land. 'If I have offended you,' he added earnestly, 'tell me my fault; but at least let me try to win your regard, for that you have a heart hidden away somewhere under your captain's tunic, and that it is worth winning, I am sure, or I should not feel so strangely drawn towards you. Tell me, has no young lady ever been able to wake you from your reserve, or have you been unfortunate in your choice? If so'—and here his voice was full of compassion—'forgive me the question. I will ask no more.'

'No, Maurice,' I replied—and the frankness of my smile must have convinced him—'I have never been in love with any lady. But do not talk to me of love or friendship while Poland is still in chains; till this war is over I have vowed never to think of either, and am the friend of Poland alone—she can have no rival in my heart. Perhaps'—for here the heart which he had truly said was hidden away began to feel touched at his disappointed look—'when Poland is free, and we are no longer fighting her battles, I may be able to show you that I do not undervalue your friendship. But now duty, and that *alone*, must be the one thought and object of our lives. To-night I purpose moving farther east. You will order the men to fall in at ten o'clock, when the moon will have risen; and, mind, they must keep strict silence. Till then let them take what rest they can.'

For a long time I was very fortunate in my encounters with the Russians, and more than once succeeded in turning what seemed a certain defeat into a brilliant success; while the number of my followers increased in proportion as I gained the reputation of being a daring and skilful leader.

How I became so successful I do not know, unless it was that my father's early schooling in the science of war as practised by Napoleon's generals served me now in good stead, or that I threw myself into my new career with my whole heart and soul.

It no longer seemed strange to me to be dressed like a man. On the contrary, I strode about and shouted my orders in a fine, deep voice, as if I had never been anything else; nor did any of my men—among whom, though there were many fine

characters, there was also a leaven of bad—have the slightest suspicion that it was only a poor lonely young girl whom they followed into the fight so devotedly and who required such implicit obedience to her authority.

On one occasion I even fought in company with the two gentlemen who had challenged me to shoot a rifle-match with them at the castle, little thinking how stern a rifle-match we should shoot together afterwards; but they never guessed my identity. And you may be sure I took care to remove the rings that had betrayed me to Father Ambrose.

But at last there came a turn in my good fortune, and it began with the death of my brave horse Zampa.

(To be continued.)

THE RED SEA SHORE.

St Medard dwelt on the banks of the Nile,
He had been living there years fourscore;
And now 'taking the air,' and saying a prayer,
He was walking at eve on the Red Sea shore.
Ingoldsby Legends.

AND a fine, hearty old gentleman St Medard must have been to dwell on the banks of the Nile and take his evening promenade on the 'Red Sea shore.' And did he, one wonders, keep up these little post-prandial excursions during the months of July and August? For, if he did, the climate must have undergone a considerable change since that time. And where are the palm-trunks, one of which was overtaken by such an unfortunate fate? Perhaps they have all been *lean'd on*, and have disappeared long ago. Or possibly the elucidation of these mysteries lies in that *hiatus valde deflendus* which precedes the stanza quoted.

Be this as it may, there is probably no place in the world where the heat is more intolerable and the general aspect more desolate and barren than on the shores of the Red Sea. There is a terrible sameness about the scenery: the long brown line of desert, lapped by the calm blue sea, and in the distance a range of gaunt, inhospitable-looking mountains. These are the main features on both sides of the Red Sea. On the African side these mountains start at Gebel Gharib, near the Gulf of Suez, and continue with very few breaks right down to the great north-east escarpment of the Abyssinian highlands, whose foothills at Massowah abut almost on to the sea.

A few Arab towns may be found along the coast; and, few and far between as they are, one would wonder to what they could possibly owe their existence. Outside of their diminutive confines the eye searches in vain for a sign of cultivation or of human habitation. Yet there they stand, as they have stood, most of them, for more centuries than any one can tell. They are said to date back to those days when the kingdoms of Egypt took their places among the kingdoms of the world. Time has swallowed their history even as the sands of the desert have swallowed the still more ancient cities of the interior. A huddled little group of white buildings, dominated by the inevitable minarets, stands quivering and winking in the everlasting heat-haze just on the line where the deep-blue sea meets the brown monotony of the desert. It might be an architectural group in sugar taken from some titanic wedding-cake and planted there holus-bolus. Take a walk through its narrow, tortuous streets, and you will find them busy enough in their dreamy Eastern fashion. Arabs, turbaned and spotlessly attired, are passing to and fro or bargaining at booths with the half-naked rustics who have come in from the desert. Long strings of camels laden with the produce of the far interior are halted at the merchants' doors. Pilgrims for Mecca arrive and embark on the dhows that ride at anchor in the roadstead. Many of these poor Faithfuls have come from the uttermost confines of the Mohammedan world, from the western Sahara, from Kano, from Timbuctoo. They will have been away three, four, and even five years from their countries by the time they get back—if they ever do get back. Now they are poor in the world's goods, most of their little hoards have been spent on the road, but faith and hope is to them an endless store. Mecca is near, and having reached it, what matters afterwards? Formerly the traffic in slaves played a considerable part in the affairs of these towns. Now, though the trade may and does go on surreptitiously, the vigilance of those masterful, interfering English makes it but a poor speculation for the 'city man' of the Red Sea.

The rainfall in these regions averages on the coast about five inches a year, and occurs at about the end of October or the beginning of November. From October to the end of April, though the heat is intense during the day, the nights are fairly cool. Then comes summer, and with it the terrible *haboob*. July and August appear to be the worst months, the thermometer frequently registering one hundred and fifteen degrees and more in the shade, and averaging from eighty-five to ninety degrees during the night, the intense humidity rendering this heat far more trying than would be the case in the high desert, where the air is comparatively dry. The *haboob* is a hot wind, laden with fine sand, which blows over the country for many hours at a stretch, rendering travelling difficult and often impossible. Take a typical day during July or August. Up to ten o'clock in the morning perhaps not a breath will have stirred the atmosphere, which on the coast is something like

that in a tepid swimming-bath. Then suddenly comes a blast as from a furnace, and a vast opaque cloud is seen rolling along the land, rapidly obscuring everything in its path. It sweeps with fury over the town; the inhabitants rush to close their doors and windows, whilst the eyes, ears, and nostrils of any unfortunate pedestrians who happen to be out are quickly filled with the driving sand. This storm will probably last all day, giving place to another breathless night. Sometimes an extraordinary heat-haze will rise almost as thick as a fog, partially obscuring the sun, though the heat remains undiminished.

It would perhaps seem strange that in these uninviting regions there should live and flourish a tribe of the *genus homo*. Yes! Man the ubiquitous, who makes his home in the Arctic snows, in Europe, in the Pacific Isles, in the Congo forests, even in ships on the ocean, finds a refuge here, and a refuge which he would probably not exchange for the most verdant paradise you could offer him. Those arid plains and barren mountains, and the right to wander over them at will, represent home to the Hadendowa—the 'fuzzy-wuzzy,' the 'man who broke the British square.'

Take a ride into that desert, which to your inexperienced eye would not appear to contain as much as a single blade of grass. Here and there at long intervals will be found the humble shelters of matting which form the movable habitations of these nomads. Let us stop at one of these places and see if we can gather anything of the life that is led by these people who seem to thrive in the least favoured places of the earth, and with scarcely any artificial aids to comfort.

We will assume that it is the best season of the year—the winter—when the life-giving breezes from the north are blowing over the desert. At the opening of the structure sits the head of the family, a gray-bearded, handsome old man withal, as lithe and well knit in the autumn of his days as in his youth. His brown complexion and fine-cut features tell of his Arab origin. He is whittling at a piece of wood intended for the framework of a pack-saddle, which he has just cut from one of those dwarf mimosa-trees that seem to be fairly abundant along the edge of that dry watercourse despite the apparent barrenness of the land. A little farther on is a young girl sitting under a bush, to which is attached a skin bag which the girl is rocking to and fro; the bag contains milk which is being converted into butter. Yonder are a couple of women, each with a baby on her back. They are pounding at some millet in a wooden mortar and singing cheerily enough a somewhat dirge-like song.

Towards evening the sounds of laughter and conversation come floating across the clear desert air, and shortly afterwards three or four young men ride up on sleek, well-conditioned camels, with two or three pack-animals. They come from Suakin—to them a wonderful metropolis—whither they departed by moonlight last night, taking with them skins, butter, and perhaps a young camel or so for barter. They have brought back millet (a luxury for the desert dwellers), cotton cloths, and possibly money. The young men, having removed the loads from the camels and turned the animals out to graze, now approach their senior, whom they salute with every token of reverence, and then, sitting around him, they proceed to relate all that has befallen them since their departure from the encampment.

Later on the bleating flocks are driven in by the youths who have been herding them up the *khors* (dry watercourses), where quantities of nutritious vegetation are to be found. The camels are milked and then turned over to their frantic young ones, who have been prevented all day from taking their natural sustenance by means of an ingenious contrivance attached to the teats of the mother. Then comes sunset and evening prayer. The mantle of night descends upon the desert, the murmuring voices of the men soon die down, and every one is wrapped in slumber.

Such is the life of the Hadendowa in times of peace, and one would think it to be a happy and all-sufficient one. Unhappily these simple tribesmen are just as prone as the rest of poor humanity to covet and desire that which is not theirs; and as there is little or nothing lying between them and the attainment of their wishes but their own valour and enterprise, raids, tribal feuds, and warfare are no uncommon features of their existence.

Towards the end of June these people move from the coast into the hills, where light rains will have renewed the sparse vegetation. In this range of hills there is one spot which presents such an extraordinary contrast to the barren aspect of the surrounding country that it is well worthy of description. It lies about thirty-five miles west of Suakin, at an elevation of three thousand five hundred feet. It would appear that at this place, which extends several miles along the top of the range, the mountains, by some strange accident, had got just a little too high—high enough at all events to attract a greater rainfall, for here trees and shrubs in an amazing variety cover the upper slopes. On the top are beautiful stretches of green-sward, flanked by ridges and hillocks, which are covered with clustering masses of vegetation, in which the candelabra euphorbia, palms, creepers, and shrubs figure largely; the granite boulders of fantastic shape which everywhere peep out from the foliage complete the peculiar beauty of these giant 'rockeries.'

Thousands of baboons make their home up here, the bush swarms with a species of silver-gray francolin, whilst the variety of doves and smaller birds seems to be literally uncountable. There is no running water to speak of, but the torrent-beds contain pools. There is no more fascinating occupation for a lover of nature than to lie hidden near

one of these pools and watch the movements of the innumerable birds which come to quench their thirst and perch in the tall trees which overshadow the *khor*. The writer has often tried, though without success, to observe the baboons in this way. These animals must be possessed of remarkable powers of perception. They would advance to within thirty or forty yards of the pool without suspicion; then suddenly the senior 'old man' of the troop would give vent to a hoarse shout, and all the baboons would stop or retire, chattering with the greatest excitement; then if nothing happened they would quietly sit down on the rocks and wait; until at last, my patience quite worn out, I would get up and reveal myself, and then retire crestfallen, followed by the (to me) derisive shouts of the baboons.

Erkowit, as this charming locality is called, was once the snug retreat of Osman Digna. Here in these sylvan glades he was wont to assemble the Hadendowa tribesmen and preach to them the Madhi's gospel of poverty and bloodshed, and from here he made many of his successful raids. That this man of an alien race (he was a Suakin 'Arab' of Turkish extraction) should have succeeded in drawing these shepherds from their flocks and herds and involving them in a prolonged and bloody contest speaks much for his powers as an apostle. The Hadendowa grew tired of it at last, and by 1894 most of them had fallen away from the Khalifa's standard and returned to their own country. Osman Digna, however, continued for long to be a thorn in the side of the British. At one time, being hard pressed, he had abandoned this place, first wantonly cutting down the beautiful groves of date-palms which existed here. He was betrayed at last into the hands of his enemies by the friend in whom he had most trusted. This occurred as late as 1901, at a place called Irba, a little to the north on this range, where he was in hiding. Having conceived the plan of embarking on a dhow for Jeddah and thence going as a pilgrim to Mecca, he despatched the friend to Suakin to arrange for a vessel to pick him up on the coast. But this same friend, thinking less of honour than of the English gold which rewarded his treachery, laid information with the authorities, and guided the expedition which effected the capture of his chief—a sad story, but perhaps not an uncommon one in its essentials. Osman Digna is now a lonely prisoner at Damietta on the Mediterranean—out of harm's way, it is true, but far from his beloved desert and the scenes of his former triumphs and intrigues.

One of the most striking views in the neighbourhood is that obtainable from the top of a conical sugar-loaf hill. A short but steep climb up the sides of this eminence, which are richly clothed with shrubs, mosses, and maidenhair-fern, and we reach the massive heap of granite boulders which crowns the top. The panorama which now reveals itself is one that would be difficult to match in the Sudan, and possibly in many other countries. All around is a tumbling expanse of wooded hills and dales. The air is heavy with the scent of flowering acacias. From the gorges comes the crowing of the francolin, and from every hill the whooping calls of the baboons. To the east, far, far below, lies the desert stretching away to the sea, which is now flashed with silver, for the newly risen sun is hidden behind a bank of cloud. A curious notch in the coastline indicates the tortuous passage of Suakin harbour. Of the town itself nothing can be distinguished—it is lost in the immensity of the desert. This place would make an ideal watch-tower. One can imagine Osman Digna sitting up here straining his eyes in the direction of that obstinate little stronghold which, in spite of all his thousands of men, he was never able to take. Perhaps he would see the drifting line of smoke from some steamer taking supplies to the garrison. This should have been irritating enough.

Just behind us is another group of hill-tops and ridges, terminating in a peak which is still higher than the one on which we stand, though strangely enough there is not a sign of vegetation on any of them. They are apparently just outside of the fertile circle. The sides of these hills are covered with curious mounds and depressions which are thought by some to be the remains of ancient gold-workings. This is very probable, for there are many such in the Sudan. Another curious feature of this part of the country is the presence of large mounds of carefully piled stones of which no one seems to know the origin. Perhaps these hills once looked down on the toils of great slave-gangs, and echoed the shouts of their Egyptian task-masters.

Our reflections are somewhat prosaically interrupted by the sounds of distant hammering, and, looking along the valley, we see that many of the hillocks and ridges are ornamented by the unmistakable frameworks of modern wooden bungalows. Presently a puffing, grinding noise is heard; this is a steam-roller at work upon a new road, the why and wherefore of all this being that twenty-five miles away runs the Nile-Red-Sea Railway (which we degenerate moderns find to be more practical than old St Medard's way), and Erkowit has just been discovered as possessing great possibilities as a health-resort for the jaded officials of the Sudan. The Governor-General in his recent visit quickly succumbed to the charms of the place, and now the work of building bungalows and establishing a water-supply is being rapidly pushed forward. Arrangements are also being made for a racecourse, golf-links, polo-ground, &c., and Erkowit bids fair to become the Simla of the Sudan.

Thus turn the cycles of time. This place, which once witnessed the delving of the ancients, and was but yesterday the retreat of an outlaw, is to-day once more turned to account by the conquerors. To-morrow? A thousand years hence?

TASMANIA AS A FIELD FOR EMIGRATION.

By F. A. W. Gisborne.

THE colony or rather state of Tasmania contains an area of approximately twenty-six thousand square miles, and is, therefore, about the size of Ceylon, or of Scotland if we exclude the Hebridean archipelago. Its position, the map informs us, lies intermediate between the fortieth and fiftieth parallel of south latitude, and corresponds with that of southern France, central Italy, and the principal territorial unit of the Japanese Empire. Though but an islet compared with its gigantic neighbour across Bass Strait, Tasmania is distinguished by diversities of climate and physical features which almost entitle it to be called a continent in miniature.

Roughly speaking, the island consists of a rim of undulating plains, seamed by innumerable rivers, encircling a central tableland, from which rise isolated mountains to a height of upwards of five thousand feet. The strip of low country is widest in the north and east, and extremely narrow in the south and west. No other island in the world, authorities state, contains proportionately so large an extent of tableland. Along the east coast, where the low lands are sheltered from the prevailing westerly winds by the plateaus of the interior, a warm climate prevails similar to that of south Italy, without the sirocco. Subtropical fruits readily ripen, and the rainfall is light; but serious droughts are practically unknown. Throughout the eastern portion of the high lands the climate is yet dryer, but cool and bracing, and experience has proved it to be singularly adapted to those who are troubled with pulmonary ailments. Owing to the abundance of native grasses, large sheep-runs are here to be found. Unfortunately, mainly owing to the gradual disappearance of the trees which were once lightly sprinkled over the whole region, droughts seem to be increasing in duration and intensity. The deplorable denudation the country has recently undergone is only too visible to the eye of the traveller journeying by rail from Hobart to Launceston. The chief causes of the mischief have been the indiscriminating use of the axe, bush-fires (generally attributable to gross carelessness), and, worst of all, the depredations committed by the sheep. The latter nibble off the tops of all the young seedlings that spring up round the already existing trees, and so prevent their renewal. It is to be feared that unless an intelligent system of reafforestation is soon introduced this portion of the island will in the near future present nothing but the melancholy prospect of bleak, treeless steppes like those of Spain, scourged alternately by hot and cold winds; instead of the charming expanse of park-like plains which formerly refreshed the eye.

The pastoral district is a comparatively narrow belt lying between the lake-country in the middle of the island and the main railway-line. Westwards of it are to be seen, firstly, a beautiful group of mountain lakes, famed for their salmon-fishing, the largest, called the Great Lake, covering an area of some twenty-eight thousand acres; and then a wild and picturesque tract of mountains, tarns, elevated plains, and swamps, studded with clumps of pines and other trees, and intersected everywhere by deep gorges through which flow numberless streams. These ravines are so precipitous and so thickly wooded that they form most serious impediments in the way of the traveller and explorer. From the neighbourhood of the Cradle Mountain, the highest summit in the island, streams flow north, south, east, and west, adding their waters to those of three oceans and a strait. Severity, naturally, marks the climate of this region; the snow lies in sheets from two to four feet deep over the plains throughout the winter and far into the summer; and the writer remembers spending a regular old English Christmas in a hut near the Roof of Tasmania a few summers back. But the inconveniences referred to are worth undergoing for the sake of the marvellous views to be obtained on a clear day. From any eminence fully forty or fifty peaks from four to five thousand feet in height may be counted; and the masses of columnar basalt that cap them assume the most varied and fantastic forms, suggestive of cathedrals, pyramids, and ruined feudal strongholds. The vivid green of the gorges, the deep blue of the lakes, the white flecks of snow on the loftier heights, and the varied tints of the rocks present delightful contrasts. So far this portion of the island has been little visited; but rich mineral discoveries recently made in various portions of it will undoubtedly attract population very soon. To the prospector it is indeed a land of rich promise, for it abounds in extensive deposits of copper and silver ores which only require capital to develop.

Farther west the tableland falls abruptly to the Indian Ocean, and along the borders of the latter lie the wettest portions of the island. The rainfall is well over one hundred inches yearly, a quantity about five times as great as that which the opposite coast receives. This great difference is mainly due to the fact that the prevailing wind—a kind of backflow of the south-east trade-wind, similar to that which drenches with its precipitated vapours the south-west shores of South America—blows almost constantly from the west, bearing with it vast quantities of moisture drawn from the warm waters of the Indian Ocean. Over this damp and broken region luxuriant forests of the Tasmanian myrtle, blackwood, and stately eucalyptus extend

in waving sheets of verdure; and large rivers are numerous. Much of the country in the extreme south-west is still practically unexplored, owing to its impenetrable character; but as there are prospects now of a railway being constructed from Hobart in the south to Queenstown, the centre of the chief western mining-field, the prospector, timber-getter, and pioneer agriculturist will probably soon find most promising fields for their enterprise in its yet untrodden recesses.

In the north of the island a wide strip of rolling plain, with frequent belts of hilly country, separates the Western Tiers and the other ranges that form the northern scarp of the tableland from Bass Strait. Originally dense forests covered the whole of this region; but now most of the country is cleared and settled. This division of the island may be said, roughly, to embrace a tract one hundred miles long and about twenty broad. The climate is mild and equable, snow is very seldom seen except in the distance, the rainfall is regular and sufficient for all requirements, and the rich volcanic soil is unsurpassed in fertility throughout the world. This is the great agricultural region of the island, and the chief products grown are wheat, oats, hay, and potatoes—the latter being the most valuable. Tasmanian 'redskins' are now exported to the extent of upwards of one hundred thousand tons annually to the chief Australian markets, and command the highest prices. So rich is the soil that on newly cleared land crops averaging fifteen and even eighteen tons per acre have frequently been grown. As an example of the extremely remunerative character of this branch of the agricultural industry, it may be mentioned that a farmer on the north-west coast last season bagged ten tons per acre of marketable potatoes from a field of thirty acres, selling his crop at an average price throughout of nine pounds per ton. In other words, a single field returned him in one season a clear profit of over two thousand pounds. Of course this is an exceptional case; but the writer has heard of many instances where the first year's yield of potatoes from land just brought under cultivation returned to the gratified settler a sum exceeding the whole cost of the land and expenses of clearing and cultivation combined.

Wheat, although formerly a leading crop, is now losing favour with Tasmanian farmers. The latter find they cannot compete successfully with their brethren in Australia, on whom Nature has bestowed vast areas of perfectly level ground, free of timber, which can be cultivated at a minimum of expense. The Riverina of New South Wales, the mallee country of Victoria, the plains of South Australia, and the Darling Downs of southern Queensland are the natural granaries of the Commonwealth. The wheat-field in Tasmania is giving place to the meadow, and the flour-mill to the butter-factory. Dairying is a thriving and expanding industry; and with abundance of milk, potatoes, &c., pig raising and fattening are also highly remunerative occupations.

The east of the island is devoted chiefly to pastoral industries, sheep in particular being kept. Population is sparse, for the holdings are large.

To the farmer in the south, also, Nature has been somewhat unkind. The orchardist and the timber-getter are supreme. Of the fourteen thousand acres of orchard-land now in a productive condition in Tasmania, about twelve thousand acres are to be found in the valleys of the Huon and the Derwent, with their tributaries. In 1905 the writer contributed to this *Journal* a short description of the apple industry of Tasmania, so he need say no more about it now. Perhaps, however, he may be permitted to remark that, after reading with much interest two articles on the orchard industry of Nova Scotia, evidently written by a well-informed contributor from that province of the Dominion, he is emphatically of opinion that Tasmania offers superior attractions to the intending orchardist. Two points may be just mentioned: the apple-tree in Tasmania is in full bearing ten years after planting, while in Nova Scotia, apparently, twenty years are required to bring it to maturity. Again, our fruit ripens at the time when the demand for it is greatest in the northern hemisphere, and consequently higher prices may be relied on.

Besides its flourishing fruit industry, southern Tasmania prides herself on her magnificent forests and giant timber-mills. Some of these employ over two hundred men, and one turns out daily a quantity of sawn timber exceeding thirty thousand superficial feet. Nevertheless, merely the fringe of the forest country has yet been touched. When it is remembered that so dense is the growth and so enormous the size of the Tasmanian blue-gum and stringy-bark that competent judges estimate the possible average production of extensive areas of still untouched woodlands as exceeding two hundred thousand superficial feet per acre, one may form some conception of the dormant wealth that awaits development by the exercise of human skill and energy. The want of roads and railways still grievously hampers the men engaged in the timber industry, and without the expenditure of large sums in providing these facilities little can be done. Since federation, unfortunately, the Tasmanian Treasury has been sadly depleted, and individual enterprise must now do what in former days the Government did for the pioneer.

I have now briefly outlined some of the chief attractions that Tasmania offers the intending emigrant. She possesses a healthy and delightful climate, warm or moderately cold, wet or dry, according to choice of location. In the way of scenery, the tourist may choose between rugged cliffs, spacious sandy beaches, lovely fern-gullies,

and waterfalls, caves, lakes, mountains, moors, and forests. Equal diversities of occupation may be found. The sportsman will find first-rate fishing, and in some parts of the island very good duck, quail, and kangaroo shooting also. The magnificent harbours and estuaries on the south coast afford ideal opportunities also to the yachtsman. In fact, it is no exaggeration to say that the island is a Switzerland and Riviera combined; but it appeals at least as much to the man who has his way to make in the world as to the mere tourist and pleasure-seeker.

For the benefit of the former, I will conclude this article with a few prosaic details. The possible settler will naturally desire to know something about the laws regulating the acquisition of land. These are of exceptional liberality in Tasmania. Crown land, of which there still remains a large quantity open to selection, is divided into three classes. First-class land, usually heavily timbered but of inexhaustible fertility, is valued at one pound per acre; but before acquiring the freehold the selector must spend an additional pound per acre in improvements. Each applicant for such land is limited to an area not exceeding two hundred acres. If he likes to pay for his land by instalments he is allowed a period of fourteen years to clear off the purchase-money, with one-third more added for interest, and to complete his improvements; should he be able to comply with the required conditions at once, he can pay for his land and obtain his deed as soon as his improvements have been finished. Second and third class lands are valued at ten shillings and five shillings per acre respectively, and can be selected in larger areas and on similar terms of deferred payment and improvement to the value placed on the land itself. Most of the country thus classified is suitable only for grazing purposes; but a fair quantity well adapted for fruit-growing can be obtained at these cheap rates. The man who selects a block of first-class agricultural land usually has the timber ring-barked and the scrub felled early in summer, and in autumn burns off. Grass-seed is sprinkled over the ashes left by the fire, and, failing the appearance of caterpillars meanwhile, an abundant growth of grass is visible by the following spring. The seed obtained from this will probably pay the costs of clearing and sowing, and if stock are then put on they readily fatten. As soon as a butter-factory is built within reach dairying becomes the settler's chief resource, for a good milking cow is expected to bring in one pound per month, and a small herd yields a very respectable income. In his spare time the pioneer farmer occupies himself in fencing, 'cleaning up' the partially cleared land by collecting and burning the huge tops that are scattered about, grubbing up the stumps, and preparing the ground for the plough. Finally, when the rough bush-track to his holding has been converted into a metalled and graded road, he turns his attention to oats and potatoes, and soon finds himself the enviable proprietor of a valuable farm.

If he object to leading a secluded life and 'roughing it' in a bush-hut, the immigrant with capital at his command can buy an improved farm near a town or railway. But such properties are expensive, and prices range from ten pounds to thirty pounds an acre. The soil, too, in many cases has been impoverished by wasteful cultivation, and expensive fertilisers have to be applied to restore its productiveness. If young, energetic, and industrious, and possessed of not less than one hundred pounds to start on, the new-comer (unless an absolute novice at farming, in which case he had better serve a couple of years' apprenticeship under a skilled agriculturist) would do best to go into the bush and select for himself. Two companions or partners would have the best chance of success and enjoy the greatest degree of comfort; for one hut would suffice for their accommodation, and they could give each other mutual assistance and encouragement. Moreover, it is highly unadvisable for a single man to undertake the dangerous work of clearing new land, for in the event of an accident his position would be almost desperate.

The mining industry of Tasmania is exceedingly important. From seven shillings to ten shillings a day are the usual wages earned by working miners on the mining-fields, and boundless opportunities lie within the reach of the persevering prospector. For its size, the island may claim to be the richest country in the world in regard to mineral wealth. Within the space of about thirty years Tasmania, with the population of an English provincial town, has actually produced minerals to the value, according to the latest official figures, of twenty-six million two hundred and thirty-five thousand two hundred and thirty pounds, and more than half the quantity has been obtained within the last ten years. The total for the year 1906–7 has been two million three hundred and thirty-eight thousand two hundred and fifty-two pounds. The list of minerals worked includes gold, silver, tin, copper, lead, zinc, wolfram, bismuth, iron, coal, and asbestos—practically all of the most commercially valuable minerals that the world requires. In tin and copper the island is particularly rich, and the Tasmanian production of the former metal will most likely within the next twenty-five years equal that of the Straits Settlements. Large coalfields and enormous bodies of first-class iron ore are known to exist, but difficulties of transport prevent their utilisation. If but a fraction of the British capital invested in Argentina and on the Rand were directed here both shareholders at home and colonists abroad would be equally benefited.

Just one drawback candour compels us to admit. Living in Tasmania, thanks mainly to the medieval legislation of the Federal Parliament, is decidedly

expensive. Taxation is heavy, for a debt of some nine million pounds presses heavily on the shoulders of less than one hundred and ninety thousand people. With increased population, however, the burden would be lightened; and it is to be hoped that even Antipodean legislators will ultimately learn that the whole art of government does not consist in the multiplication of taxes. At present the only reward bestowed on the honest and industrious citizen, who has by his own efforts earned a modest competence, is that of being plundered unmercifully for the benefit of predatory politicians and the extensive class described by Bismarck as 'gentlemen of the pavement.'

The facetious and envious visitor to Tasmania from the mainland used to be in the habit of calling the island State Sleepy Hollow. This stale and foolish old gibe is now being abandoned. Let us briefly sum up the claims Tasmania possesses to so uncomplimentary a designation. She supplies the English market with a necessarily limited quantity of the very choicest wool that enters it, and Australian flock-owners are willing to pay enormous prices—one thousand six hundred pounds for a single ram in one case—for Tasmanian stud-sheep. She exports to Europe annually about half a million bushels of excellent apples, besides sending an additional million to Australian ports. The quantity of fruit produced is increasing rapidly every year. She has also the largest jam-factories and fruit-preserving works in the Commonwealth. She furnishes Australian consumers with tens of thousands of tons of the finest potatoes, besides oats, chaff, &c. She possesses the two largest tin-mines in the world—the Briseis, now producing over one hundred tons of metal monthly, and the Mount Bischoff, which since the commencement of its career about thirty years ago has added considerably over sixty thousand tons of tin to the world's supplies, and still yields about sixty tons every month. She boasts also the possession of one of the three greatest copper, silver, and gold mines combined in the world in Mount Lyell, which has already within the space of ten years enriched its shareholders with sums amounting roughly to a million and a quarter pounds sterling. There are strong evidences to show, one might add, that there are several more Mount Lyells yet to come. She can show the largest and most completely equipped sawmill south of the equator, and vessels laden with the spoils of her forests sail for ports as remote as Antwerp and Valparaiso. Her manufactures are as yet but trifling; still, her woollen goods easily hold their own for durability and excellence against the best fabrics of the kind manufactured in Europe and America.

These represent but some of the achievements of a small community numbering barely one hundred and ninety thousand people—a population less than that of a single suburb of London! Surely few will deny that the Greater Briton who inhabits this small outpost of the Empire has worthily played his part, and has shown himself to be as amply endowed with the genius of colonisation as any other member of the race from whom he has sprung.

CHILD FANCIES.

I SEEK to tease no tortured rhymes,
Nor vaguely twist the tangled thought;
Through simple ways my versing climbs
To reach the goal that fancy caught.

What things are plain to infant eyes,
The wonderment that children feel
Who watch the glow when sunset dies,
Or mark the rose-blush dawning steal

Its tender pathway through the mist,
When hill and stream their form disclose
In beauty, where the daylight kiss'd—
Herein my rhyming fancy goes.

Such things I picture, as a child
That builds cloud-castles in the air,
And cares not if cold science smiled
And said those castles were not there!

For in the handiwork of God
We find the poem all-complete;
Yon golden clouds—where He has trod,
Yon sunbeam—pathway of His feet!

I feel the beat of angel wings,
Which duller senses call the breeze,
And catch loved spirits' whisperings
When evening zephyrs stir the trees!

The moonlight dancing o'er the stream
Is where God's messengers have sped,
And left behind a silver dream
To cheer some pain-tossed mourner's bed.

Nor wholly vain the lark's clear notes
In throbbing rapture upward fly,
If, borne with these, from meaner throats,
Our hymns get nearer to the sky.

J. S. REDMAYNE.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SOUND INVESTMENTS FOR THE MIDDLE-CLASSES.

By the Author of *An Ideal Friendly Society*, &c.

IF every reader of these lines were in good health and in receipt of a salary of a thousand a year he ought to be a contented man. But he ought also to be a wise one, and of a surety his wisdom or his folly would be displayed by the use he made of his money. Note that I speak of a salary of a thousand a year, not an income. An income may be a certainty; a salary is, as a rule, subject indefinitely to a time-limit, without hope of compensation for its sudden stoppage. The wise man who is blessed with a salary of a thousand a year, therefore, makes provision not only for the life that now is, but for the life that may follow when the salary shall have ceased or diminished. If he lives at the rate of a thousand a year he is a fool, no matter though he have the promise, yet not the certainty, of still wealthier days. In proportion as he keeps the curb upon his spending and husbands his resources, not confounding niggardliness with frugality, he is wise and prudent. What is true of a man in the enjoyment of a thousand a year is, if possible, more true of a man who has to be content with less; and it is with the men with less—the average middle-classes of this country—that the writer is now concerned.

It is often said that the middle-classes, in proportion to their income, are the most heavily taxed. They are taxed by the State, and they are taxed by custom, by fashion, and by pride and ambition that are for the most part honourable. State taxes are a necessary evil; self-imposed taxes may be a necessary help. Every high-principled man, be he Tory, Radical, or Socialist, is at heart an Individualist. For his wife and family he desires the best that can be got in education, in culture, and in social advantages. He desires that they shall maintain with himself what is called his position in life. His self-respect demands it, and in many a case his continuance in that position depends upon it; and so long as these things are made compatible with frugality and with social duties, nothing but good to the man and his household can result. It is in fixing up the right relation of comfort and retrenchment that the problem of successful living is solved—a commonplace, of course; but commonplaces, as Joubert says, are of eternal interest.

It follows, therefore, that whatever a man's income, if its continuance depends upon his own hand and brain, he should save and invest as much of his resources as he can reasonably at present afford to do without. Every man is at times urged by a still, small voice within him to gather gear 'for the glorious privilege of being independent.' Adam Smith appraised this motive—'the principle which prompts to save'—as of great value, not only for individuals but for communities and nations. This principle, he says, 'is the desire of bettering our condition, a desire which, though generally calm and dispassionate, comes with us from the womb, and never leaves us until we go into the grave. In the whole interval which separates these two moments, there is scarce perhaps a single instant in which any man is so perfectly and completely satisfied with his situation as to be without any wish of alteration or improvement of any kind.' Yet, having within their hands or within themselves the means of securing this improvement, how many men there are who weakly stifle the desire and stagnate in thriftless unconcern! The way to wealth, using the word in its relative sense, is as plain as the way to market; but they walk not in it. They do not invest their surplus in sound securities, which stand beckoning at their very door, be that income large or small; they take no thought for the morrow; they simply live unfrugally, and therefore expensively, from hand to mouth, from year to year.

In speaking of middle-class investments let us exclude all thought of speculation. The man who invests should invest all he can afford to save. If he speculates, it should be only with what he can afford to lose, and the man of whom we are now thinking—the average middle-class citizen who is in receipt of a precarious salary, or at the head of a small business which, though now prosperous, may

 [*All Rights Reserved.*]

not always be so—this man cannot afford to lose anything. He will, therefore, prefer small certainties to large uncertainties, tempting though these be. Small certainties are in general not for present enjoyment, except for what they bring in peace of mind. They are prospective—for the days in which the salary may have ceased, and the business may have passed to younger hands, and the man has reached what should in some measure be the harvest of his life.

There are several ways in which the average middle-class citizen can, with gilt-edged security, invest his surplus income, but only two or three need here be mentioned. He can make use of a building society, or insure his life on the endowment system, or purchase stock as indicated below.

In the case of the building society, as indeed in that of life assurance, the earlier he begins the better, because the lower will his periodical payments or investments be; and if he live until those investments mature, the longer may he live to enjoy them. The simplest and most profitable way to make use of a building society is to become a shareholder at the earliest possible age. The mistake so many men make is that they delay until middle-age or later this most commendable method of thrift, and therefore lose the advantages that accrue to the accumulation of small savings invested at compound interest. It would greatly encourage thrift amongst young men if their parents would invest in a thoroughly sound building society on behalf of their sons. Suppose, for example, our middle-class citizen's father, when his boy was ten years of age, had taken up one building society share in the boy's name. This would have entailed the putting by of half-a-crown a week, ten shillings a lunar month, six pounds ten shillings a year. By the time the boy had reached his fifteenth birthday his father would have paid into the society thirty-two pounds ten shillings, which at 3½ per cent. interest would have stood in the books at thirty-five pounds nine shillings and fourpence; by the time the lad had reached twenty-one the amount paid in would have been seventy-one pounds ten shillings, which would then have grown to eighty-seven pounds one shilling and fivepence, of which fifteen pounds eleven shillings and fivepence would have been interest. This would have been an instructive present to the boy on his coming of age, an object-lesson in the actual and potential value of thrift. Such a lesson ought to be of lasting help to any young man. Of course, if he rightly esteemed his father's good example he would leave the eighty-seven pounds one shilling and fivepence in the society, and, so far as his means allowed, continue the monthly payments. If he did so for a little over three years, he would find that his share had matured—that is to say, one hundred and eighty-five and a quarter monthly payments would have amounted to ninety-two pounds thirteen shillings; the addition of twenty-seven pounds seven shillings interest would have increased the amount standing to his credit in the society to one hundred and twenty pounds, one fully paid-up share. If two shares or more were in this way subscribed for, the amount standing to the credit of the young man before he was twenty-five years of age would be correspondingly greater. But let us suppose that he has only one share. He might do one of two things with it. He might let it remain in the society as an investment earning 3½ per cent. compound interest and a bonus, and begin to subscribe for another share, or he might use his one hundred and twenty pounds as a letter of introduction to the lending department, and at once set about the purchase of a house.

Building societies vary in their practice both as to the proportion of the value of property upon which they advance and the interest they charge; but it may be taken as sound in principle to advance three-fourths of the value of the property to one who has been an investing member of the society, and to charge him 4 per cent. interest. The society, of course, employs its own valuer. Our young man, therefore, may find himself at twenty-five years of age in possession of a house of the value of four hundred and eighty pounds. If in addition to his investment with the society he can find another hundred pounds, he can take up a mortgage for a house worth, in round figures, eight hundred pounds.

It has here been assumed that the young man has had the foundation-stone of his good fortune laid for him by a thrifty father. He starts with a great advantage over his neighbour who has to provide and lay that stone for himself. But the stone may be found and truly laid at any age, and, as already stated, the sooner the better, because the essence of the building society system as a method of thrift is that a man should as early as possible begin to be his own landlord and pay his 'rent' to himself.

The amount advanced by the society for building or buying the house has to be repaid by fixed monthly or quarterly instalments spread over a fixed term of years—thirteen, seventeen, or twenty-four as the case may be—with the 4 per cent. interest. The borrower knows exactly from his pass-book how he is paying off his mortgage, in principal and interest. He pays the society, but in reality he is paying himself. If his house is worth forty pounds a year, and he is merely the tenant, in five years he puts two hundred pounds into his landlord's pocket (less taxes). Being a member of a building society, he puts that two hundred pounds into his own, which is far better. Of course he pays something besides rent—there is the interest; but he should remember that it is the interest that buys the house and makes the man his own landlord. It may at first seem rather heavy; in the earliest payments there is such a lot of interest, and relatively so little principal. But time adjusts all things. At the end of five years the disproportion is more nearly balanced; at the end of ten

there is very little interest remaining, and in another three, if the loan is for thirteen years, the borrower goes to the office of the society, has a pleasant little interview in the secretary's private room, and comes away with his title-deeds in his pocket and joy in his bosom—the house is his own. Nobody can run away with his property. It is true, there are vague rumours in the air that a time is coming when private ownership of property will be abolished by the State, and building societies will no longer be suffered to exist; but the prudent man will not be unduly disturbed in mind. What he has hitherto paid in the form of rent to himself he can now save in other ways or spend, and in all probability his thirteen years' experience of thrift and the tangible results of it he now possesses will induce him to do either wisely.

Then think of the tranquil joy the man feels in that possession. He has made a profitable and an entirely honourable investment. He has the approval of his self-respect and a substantial reputation amongst his neighbours. If, from year to year, he had spent his surplus, as so many men do, in frivolous luxury or worse, he would still be a tenant—for a man must live somewhere—paying thirty pounds or forty pounds a year as rent to a landlord. He is now his own landlord, and the money which he would pay as rent he now pays into his private banking account or makes other wise use of. The facts need only to be stated to prove the value of the building society as a medium for thrift. There is another consideration, too. As the owner of the house in which he lives the man has a personal zest and interest in improving his property. His garden is doubly prized. It may and probably does cost him annually more than he would otherwise spend upon it; but he can now afford it, and the satisfaction he finds in beautifying his little estate must be experienced to be understood. Ruskin was right in saying that we must buy what we would find real pleasure in. The man whose thrifty investment has enabled him to purchase his house probably has a fuller pleasure in it than the man to whom his house has been bequeathed.

Life assurance on the endowment system is a form of investment which is safe and profitable if conducted upon prudent lines. Great care should, of course, be taken in the selection of the office in which to insure. The writer has now in mind only mutual offices, in which the whole of the profits are distributed among the assured. There are proprietary insurance offices which are perfectly sound, but an endowment assurance in a mutual office is recommended as the steadier, if not always the more profitable, form of investment for the man who desires above all things ample security and peace of mind.

Unprejudiced expert advice in the selection of an office cannot always be had, but two or three very simple precautions any man can take before choosing. He should select an office which accepts only first-class lives, which does its business efficiently on a low percentage of management expenses in relation to its premium income, and which has a substantial reserve fund. The earlier the age at which he insures the better, because the lower will his premiums be, and if he live until his policy matures, the higher the total amount of interest his investment will earn. To take a moderate example: suppose that in his twenty-fifth year he takes out an endowment policy for five hundred pounds, payable at fifty-five or earlier death, with share in profits and bonus distributions, his annual premium will amount to about seventeen pounds seventeen shillings. On his reaching his fifty-fifth birthday the office will pay him a sum of money representing the whole of his premiums, with 3½ per cent. compound interest added. If he can afford to pay an annual premium of thirty-five pounds fifteen shillings, he can insure for one thousand pounds payable at fifty-five or earlier death, and be sure of his investment maturing at the same rate of interest. If the policy be payable at sixty or sixty-five, the premiums are, of course, lower, but fifty-five is a convenient, a 'popular' age. The average man can look forward to his fifty-fifth birthday with the expectation of being at that age young enough to appreciate with some zest the maturity of a good investment, and old enough to enjoy release from the strain of systematic economy. During the thirty years his family will have been provided for in case of his death, and with his five hundred pounds or one thousand pounds and 3½ per cent. interest again invested, his gray hairs need not worry him. If, happily, he has practised double-barrelled thrift, by means of a building society and a life assurance office, he will be able at fifty-five to twiddle his thumbs at his own fireside and sing with old Ben Jonson, 'Here is one that wishes to live longer!'

'The glorification of selfish ease,' does some one say? Not so. Since thriftlessness and extravagance bring their own misery and condemnation, do not thrift and wise investment merit comfort and esteem? The thrifty man who has honourably made himself independent in his old age can laugh at envious sneers.

Coming to investments on the Stock Exchange, it is easy to venture upon treacherous ground. Some time ago a reader of *Chambers's Journal*, who had read an article in these pages on thrift, asked for advice. Many people in India, he said, would like to improve their savings by means of investments which he specified, 'but,' he added, 'are deterred through fear of fraud.' He went on to ask for some explanation of how the fraud is worked. The writer does not feel qualified, nor would it be prudent if he were, to explain in detail how financial swindling is done. There is no doubt that it is done to a much larger extent than is commonly supposed, and there is every reason for putting small investors, whether in India or at home, upon their guard against plausible advertisements and

clever trickery. The best advice, perhaps, is: Don't be persuaded to invest your money at a high rate of interest. Be satisfied with a small return for good security. Limit your choice to investments yielding from 3 to 4½ per cent. Remember that honest business is neither philanthropy nor sharp practice. British Funds afford a safe 3 per cent.; Corporation and County Stock, including Corporation loans at fixed rates of interest, and Home Railway Debentures, from 3½ to 4. These are less subject to fluctuation in value than any other securities. Colonial and Foreign Railway Debentures yield from 4 to 5. A class of investment which is greatly favoured by those who want to plant a few hundreds safely is a mortgage on freehold property, care being taken to secure a good margin of value over the amount lent. On this class of investment 4 to 4½ per cent. is a fair return. 'Guaranteed mortgage debentures' are also commended on the ground of safety. It is a form of debenture given by a limited company over its properties, and guaranteed as to principal and interest by some of our best insurance companies. With respect to a mortgage on property, it must be borne in mind that a solicitor has to be employed to safeguard the interests of the mortgagee, both on entering into and terminating the mortgage. And this, of course, means costs; and, moreover, it is not always possible to obtain possession of one's money as promptly as might be desired. On the other hand, the Funds, Foreign Government securities, and Corporation and County Stock are realisable at will, which to an investor, especially a comparatively small investor, may be of the greatest importance.

As a general rule, the soundest investments are those which the investor reaches through unquestionable business channels; others that are eagerly commended to him and attractively advertised may be quite safe and profitable, but they may be otherwise. With so many sound and old-established banks and insurances offices, and openings for investments, to choose from, there is really no excuse for the man who makes mistakes. The middle-class investor cannot afford to yield to temptations which promise abnormally high rates of interest. For him old paths and old, well-founded institutions doing business as nearly as possible on old-fashioned lines are best. More modern methods of management sometimes yield better returns, but sometimes they yield none at all. For the speculator who can afford to wait ''tween fall and rise' they may in the long-run be more profitable; but, as already stated, the middle-class investor should not speculate.

Discussing another branch of this subject, Professor Muirhead, of Birmingham, has remarked that 'a thrifty attitude of mind is an essential part of civilisation.' From this statement two lines of thought may be suggested. The first is that all men can be thrifty; at all events, the contrary cannot with truth be maintained in excuse for such as are thriftless. A man does not need to be earning five pounds a week before he begins to save. In a recent will-case tried before Mr Justice Bigham it was stated that a working-man who earned one pound a week, and whose wife added to the household income by 'spinning,' managed in fifty years to save and wisely invest one thousand pounds. Thrift seems too mild a word by which to describe such household economy, and doubtless Professor Muirhead had in mind something easier. The working-man's one thousand pounds represents one almost incredible extreme; on the other hand we have an appalling amount of waste, in spite of examples on every hand encouraging to frugality. Thousands of men are to-day living in their own houses simply and solely as the result of a little wholesome self-discipline in earlier life; they have saved money systematically, often out of very moderate wages, and invested it prudently, and now in the autumn of their days they are enjoying the reward of what it seems absurd to describe as self-denial.

The other suggestion that arises from Professor Muirhead's remark is that the possession of property is the basis of civilised life. The doctrine is often disputed. Socialism is in theory opposed to it, though Mr H. G. Wells has declared it to be 'a doctrinaire and old-fashioned Socialism which quarrels with a little hoard.' Apparently what it quarrels with is a big hoard — an inconsistency which Mr Wells may be left to escape from in his own way. But really the writer ought to apologise for dragging in Socialism, for after all what has it, or can it have, to do with 'Sound Investments for the Middle-Classes'?

CASIMIR LE SOMBRE.

CHAPTER XII.

POOR Zampa! I grieve still when I think of his loss. It was on a Friday—a day of which my father, with a fatalism not uncommon among the followers of the first Napoleon, had a superstitious dread. We had been surprised in the morning by a party of Cossacks, who had only fallen back under our fire to return again to the attack, accompanied by a strong force of infantry and a couple of guns.

Fortunately, I was in the habit of protecting my camp with a rude breastwork of felled pine-trees, placed end to end, the projecting boughs of which formed a sort of chevaux-de-frise very difficult for cavalry to cross, while they afforded shelter to my riflemen, and we were thus able to hold our

position; but, owing to the nature of the ground, our line of defence was rather extended, and I was riding from one end to the other when a fragment of shell came fluttering and whistling towards me as it ricochetted from the stump of a tree.

I plunged my spurs into Zampa's sides, but too late; a shriek rang through the forest so terrible and unearthly that there is nothing to which I can compare it, a shriek that is only known to those who have been in a battlefield—the terrible cry of agony that on rare occasions escapes from the throat of a horse. And the next instant poor Zampa fell headlong to the ground.

As I took his head on my knees, his soft, dark eyes turned on me reproachfully as if to ask why I required him to bear this suffering, then a tremor ran through his limbs, and I knew the brave horse had taken his last gallop.

I bowed my head down and wept like a child. Through all my strange, solitary life in the midst of a crowd, Zampa had been the one friend to whom I need not act a part; on him I could lavish those gentle caresses that it is in the nature of a woman to bestow, to him I could whisper the deepest secrets of my heart, knowing that he would keep them safe, and stroke my hand with his soft nose and look at me intelligently with his large dark eyes to let me know that he sympathised with me. Zampa and I understood each other, and we were almost always together; often, when halting on the march, had I laid me down and slept with my head resting against his soft mane, and in the fight he had once saved my life by the quickness with which he eluded the thrust of a Cossack's lance.

A hand was laid on my shoulder, and Maurice St Hilaire stood beside me. 'Poor beast!' he said. 'I will bury him myself to-night. I did not know that you could feel so deeply, Captain Casimir; but you are wanted now.'

I sprang to my feet and dashed the tears from my eyes, for I was vexed that he had been a witness of my emotion; and I turned again to the scene of conflict, determined that *there*, at least, he should see nothing womanly in my conduct.

'Stop,' he cried, following me; 'take my horse; you must not go on foot.'

But I waved him back, saying, 'I have lost Zampa, and will ride no other horse to-day,' and was soon among my men.

It was true that I was wanted. Distressed by a flank fire from the cannon, and hotly pressed by the enemy in front, the centre of our line was beginning to give way; and had I not seized a standard and thrown myself among them, the Russians would have been over the breastwork. Fortunately my men were used to rallying to my voice, and, closing around me with fresh courage, they drove their assailants back at the point of the bayonet.

I looked for Maurice, but he was not as usual beside me, when suddenly there was a deafening Polish cheer, and I perceived that the two guns which had so harassed us were turned against the enemy. Maurice St Hilaire, at the head of a few resolute horsemen, had surprised and captured them.

This feat turned the scale in our favour; but though we had held our ground successfully, when we came to count our losses we found them so severe that after burying the dead I thought it prudent to retire during the night to another position.

CHAPTER XIII.

HOW can I describe that *other* terrible loss? Though the day and the scene are graven indelibly on my memory, even now the old sickening pain comes back to me as I recall the dull, leaden sky, laden with rain, the yellow fields of trampled corn, and the little village of brightly painted houses nestling in their midst, the dark line of fir-forest all round, and the dank, green, treacherous bog in front, along the borders of which our sharpshooters were skirmishing.

The Russians held the village in force, but it was important that we should dislodge them, and my men were advancing gallantly to the attack. Maurice St Hilaire was beside me, full of life and spirits.

Then came that soft, gray, harmless-looking puff of smoke from a garden wall, and—and the fatal bullet sped which laid him in my arms.

My poor, noble, handsome Maurice! in a moment to be stricken down like that from all the strength of his manhood by a little piece of lead that a child might have played with.

My pride was all gone now. I held him close in my arms and called on him by every endearing name to speak to me, to hear me only once before he passed to a world beyond my reach. Just once his eyes opened and turned on mine with a strange, sweet, wondering expression, as I laid my lips on his forehead; then, with a deep sigh, he closed them again and was past the power of hearing.

How long I sat thus I do not know. Some one pulled me by the arm and whispered in a hoarse voice, 'Come, captain; it is all over. We must fly!'

It was Sergeant Dzikowski, his hair stained with blood, his face blackened with powder.

'Come away,' he said again; 'there is no time to lose.'

I looked up. The Russians were pouring out of the village, and my men were flying before them.

'But I cannot, will not, leave him!' I cried despairingly.

The old soldier bent down over the prostrate figure and shook his head.

'It is no use, captain,' he said; 'he will never fight again. 'Tis the fortune of war. Come, we shall be taken prisoners if we stay.'

'Save yourself, sergeant,' I said doggedly. 'I will not leave him to be mangled by the Cossacks.'

'Well, if it must be, it must be,' he exclaimed resignedly. 'I have fought too long beside you to leave you now. Give him to me, captain. I will

carry him to the ambulance;' and he lifted the slender figure on his broad shoulders. 'But for heaven's sake try to steady the men; they won't listen to me, but they may obey you.'

Thus adjured, I ran forward and endeavoured to stem the retreat, which had now become general; but it was of no use. It seems the Russians had been reinforced during the night, and by concealing their numbers had led us into a trap. All I could do was to collect a few faithful spirits around me, and cover the flight of my men by halting and firing from time to time at the Cossacks, who pressed closely after us. During five weary hours we fought our way back step by step, retreating farther into the forest, till at last the shades of night closed around us, and we found that we had shaken off our pursuers.

Then I called a halt and mustered such of my men as I could collect. Their ranks were sadly thinned; but though we had lost nearly all our baggage, the ambulance cart was safe, and my first care was to have its occupants lifted out. One by one the poor fellows were stretched beside the fire beneath the dark, shadowy canopy of pines; there were a few wounded and many dead who had been carried off the field by their friends, for the Russians gave little quarter. But Maurice was not amongst them.

In vain I scanned each of the calm, upturned faces; he was not there. Then I sternly called for Sergeant Dzikowski, but he also was absent. I questioned those around me, but none of them could give me any clue to his fate till late at night, when some stragglers came in who said that they had seen him cut down by a Cossack at the edge of the bog, as he was carrying a wounded comrade to the rear. Then I knew that all hope was over, and that I might not even have the sad comfort of laying the remains of the poor boy in their last resting-place.

Gallant and chivalrous, he had come from my native land to fight for Poland's freedom; and this was to be his reward—an unknown grave in the black depths of a morass!

I was not even free to mourn alone, for the safety of my followers depended on me, and had I not promised their late leader to be true to my charge? That night Father Ambrose came into the camp, having heard of our defeat and hastened to meet us; and early the next morning he conducted us by an unfrequented path to a little village in a remote clearing of the forest, where the peasants greeted us kindly and supplied our most pressing wants. In their humble graveyard we buried our dead; they were mostly beardless boys, and the young maidens of the village bore them on their shoulders to the grave and scattered flowers over them.

Father Ambrose performed the service, and could not help noticing my emotion; after it was over he drew me aside and said kindly:

'Daughter, I fear this work is preying on your health. I have decided that I will not again absent myself from you, and if you find that the task you have undertaken is too heavy I will seek to find some one to relieve you.'

'No, Father,' I replied sternly, for a sullen rage against the Russians was burning in my heart; 'I will fight to the bitter end. It is good of you to promise not to leave me again, and to lend me the strength of your counsel; but do not fear that I shall break down because I seem moved to-day. We have had a reverse, but erelong it shall be wiped out; and it is on that hope I live now.'

CHAPTER XIV.

WE stayed some days at the village till all the stragglers had come in and the strength of my men was somewhat recruited. Then I again set out in search of the enemy.

I was now more than ever Casimir le Sombre, for a black cloud had fallen over my soul. In vain did the call of the cuckoo and the coo of the turtle-doves ring sweetly through the woods; they only deepened my pain, and my heart was fiercely bent on exacting stern retribution for the murder of Maurice.

Though I hope and believe I never killed a man with my own hand, many a human life had been sacrificed by those under my command; yet now, in the madness of my grief, I said that the Russians had murdered Maurice, and that I would have vengeance.

'Vengeance is mine, saith the Lord,' and I was mercifully prevented from carrying my wicked desire into execution. In the very first encounter we had with the Russians after my defeat I was wounded in the side. A dull shock, a sharp, burning pain, a strange tingling through every vein, and then a deadly sickness as the landscape seemed to whirl around me—that was all!

They ran to support me, and would have torn open my shirt, but I still had sufficient strength to bid them not to touch me, and called for Father Ambrose. They thought it was the command of a dying man asking for the priest, and they obeyed. I saw the Father dimly, as if through a mist; a scarf was tied tightly round me; then I was lifted from the ground and placed in some sort of cart that moved away at a rapid pace, jolting and bumping over the roots of the trees; and after that I lost consciousness.

When I awoke I was lying on a neat little bed in a long, whitewashed room, with a black crucifix nailed against the wall, which reminded me of the convent where I had been at school. A nun in a white cap and gray dress was sitting beside me, and as I opened my eyes she smiled and held a cup of some cooling liquid to my parched lips.

A lazy, dreamy sensation was upon me that I felt no inclination to shake off; and, closing my eyes again, I sank into a soft slumber and dreamt

of my old home in Alsace, and the hazel-wood where the rabbit-warren was, and little Eulalie, the schoolmaster's child, and Scaramouche, my faithful dog. Then a dull booming sound fell on my ears, which troubled me, and from which I tried vainly to escape, and at last I awoke with a start.

I was indeed in a convent, and the bell was summoning the nuns to vespers.

I afterwards learnt that my wound had been severe, but the bullet had been extracted, and careful nursing and a good constitution carried me through. Gradually my strength returned, and I was able to sit up; then I became very hungry, and longed for more substantial food than the beef-tea and toast which I was allowed; from beef-tea I progressed to chicken; and at last, when the snow was once more lying softly on the branches of the fir-trees, I was able to rise and take my first walk through the galleries of the convent.

Father Ambrose now came to see me frequently, and told me how he had brought me straight to the convent after I was wounded, and that no one had discovered my secret; how the insurrection was nearly at an end, and my own regiment had succeeded in reaching the frontier and dispersing.

'So,' said he, 'there is nothing for you to do but to wait patiently till you are strong enough to escape from the country.'

This was no easy matter, as the Russians kept a strict watch on the frontier; but a journey which the abbess had to make to Presburg furnished me with an opportunity. Disguised as a nun, in which costume the most vigilant official would hardly have recognised the insurgent leader Casimir le Sombre, I accompanied her to that place. From Presburg I went to Paris, where, Father Ambrose had told me, the Countess Czartoryska was staying with her husband, who had also been obliged to fly from Poland; and one day early in March I left my hotel in the Rue St Honore and started to seek her apartments.

(To be continued.)

PAPER-MILLS IN SCOTLAND.

THE SEARCH FOR RAW MATERIAL.

TO the sojourner in Midlothian the paper-mill is a familiar and insistent feature of the landscape. Judging by the aroma when he gets to leeward on a windy day, he may be pardoned if he holds the opinion that the county can produce all the paper that is wanted by the inhabitants of the United Kingdom. While Scotland has a very thriving industry in the manufacture of paper, yet it is a bad second to England. In number the mills of Britain are: England, two hundred and seventeen; Scotland, fifty-six; Wales, seven. The sister isle has only six, although Ireland's water facilities are surely ample enough for the trade.

In Scotland, the county of Midlothian heads the list with fifteen mills; but Lancashire far exceeds that total with forty-three mills, followed by Kent with thirty, and Yorkshire with twenty-eight. In looking at the Scotch counties it is interesting to observe how the Highlands have escaped. There is no mill in either of the big counties Perthshire or Inverness, nor anywhere north of Aberdeen; and with the exception of Berwickshire, where there are two firms, none of the Border burghs has a factory. Ayrshire has none, nor Kirkcudbright; in fact, there is only a small mill at Dalbeattie to represent the South of Scotland.

But in quality of work the Scotch factories are inferior to none. The directors and managers are a far-seeing class of men, and have no hesitation in adopting new processes and introducing the latest plant. Owing to the high price of raw materials, paper-millmen have been forced to look ahead. So great is the foreign competition in the cheaper kinds of paper, especially 'news,' that Scotch makers have to put the utmost value in their raw material before it leaves the mill. To do this means the best technical knowledge and the most improved plant. Electric power has been introduced by some owners in place of steam, and motor-wagons have superseded horse-traction. Skilled chemists are inventing new methods of economical treatment, and the machine-maker installs a machine to turn out a larger quantity of better paper at a cheaper working-cost. This is a trade in which there is no standing still.

One of the curious things about the paper-trade is the change that has taken place in raw materials. Not so long ago esparto grass was the chief commodity, and immense quantities arrived from Algeria and Spain; but esparto has given way to wood-pulp. Figures will prove this. During the nine months ending September 1907 the total quantity of esparto imported into the United Kingdom was only 150,671 tons, whereas the weight of pulp-wood imported for that period was 471,954 tons. Of linen and cotton rags imported from the Continent the weight was 14,825 tons. It may be stated, however, that London is the chief source for rags, with Manchester next. Another interesting fact is that while this country imported in 1906 manufactured paper to the value of £5,728,000, yet British makers exported a large quantity of paper. Were it not for the heavy tariffs there would be much more paper shipped abroad. A Scotch manufacturer, when in France and Belgium last year, showed samples of his paper to merchants in these countries. They were highly pleased with the quality; but the heavy duty of 25 to 30 per

cent. made it impossible to do business. Notwithstanding this exorbitant tariff, the singular spectacle was seen at Leith Docks on one recent occasion of a steamer from the Continent landing foreign paper for Scotch buyers, and at the same time loading into another hold packages of paper from a Midlothian mill to be delivered at the same port from which the vessel had brought the foreign stuff.

What troubles the Scotch makers most of all is the question of raw materials. They cannot make paper out of air and water, and have to search around considerably for stuff at a reasonable price. Unfortunately the cost is always trending upward. Wood-pulp is the backbone of the mill to-day; but how long will this continue? Just consider the vast volume of wood devoured by the pulp-grinders in 1906. In the United States the estimated total was 8,000,000 tons, in Germany 2,000,000 tons, in Canada 1,000,000 tons, in Sweden 1,000,000 tons, in Russia 250,000 tons. Britain's bill for pulp—the money paid by the mill-owners to the lumber-owners—was £3,000,000 sterling.

So great is the demand for wood-pulp in the United States that the forests are disappearing wholesale. Every year sees a rapidly decreasing average. There are twelve hundred paper-mills in the States producing 4,000,000 tons of paper each year; and new factories are constantly being erected. In Sweden and Norway the 'stumpage'—to use an American word—is quickly vanishing, and as new factories are getting to work the demand will get keener and keener. One huge machine built by an Edinburgh firm of engineers was shipped from Leith to Sweden. It weighed in all 550 tons, and a special steamer was chartered to convey it to Norrköping. It runs off two sheets of 'news,' each seventy-five inches wide, at a constant speed of five hundred feet per minute. Multiply similar or smaller machines, and then calculate the number of logs necessary to supply the pulp, and that is only for home consumption: the Scandinavians regard this country as a profitable market for pulp.

Fortunately the Swedish Government has become fully alive to the necessity for making good the ravages on the timber-lands; and there is now in force a very extensive system of cheap planting. Numerous small boys are engaged in the work. They go in a row about three or four feet apart, dig out small holes in the ground with a hand-iron, and drop in a few seeds. By this method ground is now being planted at the marvellously cheap rate of two shillings per acre! Spruce and larch are the woods most wanted; the great bulk of the paper used is now made out of spruce, and perhaps Scotch landed proprietors may turn their attention to the market in this country for wood for paper purposes. There are many thousand acres lying waste which could readily be converted into a boon and a blessing to the mills. In Norway 1,500,000 trees are planted yearly in the public forests, in addition to a large number planted by private owners.

Meantime the price of paper is ruled by the price of wood, and the American newspaper proprietors are getting restive. Sunday papers in the States run to thirty or forty or more pages, and as 'news' has advanced fifteen cents per hundred pounds, and is likely to continue advancing, these papers may have to be reduced to normal size, which, after all, may not be an unmixed evil. Everything is being done to unearth a substitute for wood-pulp. In Jamaica a company has been formed to make paper out of banana-skins. One of the latest achievements is converting waste cotton-stalks into a suitable pulp. Bamboo, which the Chinese use in a primitive fashion, is said to be capable of profit-yielding treatment under scientific methods. A syndicate is being or has been formed to convert the dried stick of the sugar-cane into paper; and there are 2,000,000 tons of waste sugar-cane annually produced in the Hawaiian Islands alone, not to speak of Mexico and other sugar-growing centres. On the banks of the Nile attention is devoted to the cultivation of the papyrus plant, and a consulting chemist reports that its adoption is only a question of quantity obtainable and cost. An expert is touring through India, accompanied by a portable laboratory, testing the innumerable fibres of the country as to their suitability for paper-making. At Capac, Michigan, machinery is now in operation transforming peat into paper, the only admixture being 10 per cent. of sulphite screenings. Perhaps our Irish friends may follow this example. Enormous heaps of rice-straw are burnt in the fields of Burma to clear the ground for tillage, and it is said to be excellent material for paper-making. A large mill is now being erected in Los Angeles, California, with a capital of two and a half million dollars, for the manufacture of paper out of fibres heretofore not used in paper-making; but what these fibres are or where they come from is kept a secret meantime, except that they are not grown in the United States. In short, almost every country, tropical or temperate, possesses abundant raw material; but what the Scotch paper-maker wants to know is, when that raw material is going to be deposited at the mill gates, and the price.

There is an important adjunct to a paper-mill—namely, the smell. Some of the odours are very agreeable. When a rag-boiler containing starchy cottons is being blown off the aroma of coffee is quite appetising. Esparto also boils sweet, and so do hemp and divers straws and grasses which are being experimented with. But there are others! Certain types of soda-recovery plants send forth sulphur odours the reverse of pleasant. Sulphuretted hydrogen fouls the atmosphere after a blue paper coloured with ultramarine is made. The dominant smell is that of bleaching-powder, ably supported by carbolic acid or formalin or sulphurous acid. Lime-salt in contact with acid and hypochlorous

acid will make a stranger decide to keep clear of paper-mills in future.

China clay is one of the substances much used in mills, and many shiploads arrive at Leith, Granton, and other Forth ports from Cornwall. Like everything else, the great demand—even from America—has raised the price at the Cornish mines. Probably to twenty hundredweight of pulp will be added two hundredweight of china clay for certain kinds of paper, and Scotland does not seem to possess any clay of her own.

Even to enumerate all the substances that are used in the many varieties of paper would take up too much space. Of rags alone, from Germany there are eighteen different brands, varying from new white cuttings at £27 a ton to housecloth at £4. Each country has its own marks and descriptions. English thirds are as low as one and sixpence a hundredweight, and they must be pretty bad at that. Wastes sell at all figures, from £15 a ton for gray or coloured or white threads to £1, 10s. for jute waste. Esparto is as high as £5, 2s. 6d. per ton from Spain. Wood-pulp has a dozen grades, sulphite bleached going at £14 a ton, and unbleached at £9, 10s. Pine, air-dry, is £5, 15s. per ton, and aspen air-dry £7, 10s. Straw-pulp, bleached dry in sheets, is £12, 10s. per ton. Waste-paper is of many descriptions. Books and pamphlets sell at £4, 10s. per ton; white waste-paper, blue papers, and light browns go for about £4 per ton; mixed papers, £2; and crushed news, £3.

Specially interesting are the materials bought for sizing the paper. Rosin is a standby, and starch is coming into vogue for the art enamel papers; but glue still retains first place, and the bill for glue and gelatines may be anywhere from £22, 10s. upwards per ton. Of the chemicals—the sodas, ammonias, potashes, acids—their name is legion; they have one thing in common—they all cost much money. As regards colours, since the days when an absent-minded lady dropped her blue-bag in a vat of pulp, and thereby was the medium of introducing coloured paper to the world, makers have advanced exceedingly. Sometimes the colours come when they are not wanted. Old ropes off ships, when boiled for a long period with caustic soda, may give a reddish tinge to the pulp, as the result of the chemical action of the lye on the tar left in the rope. When parts of corsets or hose-supporters are cut in the hollander into hundreds of small pieces, stains from the rubber may be left on the machine wires.

Paper-mills are not now the bugbears to disciples of Izaak Walton that they once were. Modern methods of treatment of offensive waste products prevent the streams from being polluted. Take for example what has been done in the case of the Water of Leith. Although there are half-a-dozen factories, several of large size, on the banks of that small river, yet trout thrive and multiply and afford ample sport. The chemical expert is an important member of the paper manufacturer's staff: every mill of any size has its own laboratory. And it may just be mildly hinted that Scotch chemists, and Scotch foremen and beatermen, and machinemen and engineeers, are in considerable request south of the Tweed. There appears to be something in the training obtained in Scottish mills which makes skilled employés acceptable in English factories.

Poetry and paper-making are so far apart that mention must be made of a little-known poem by Thomas Churchyard, of the year 1588. It was written in eulogium of the first mill built in England—at Dartmouth in Kent—by a German, who was knighted—Sir John Spillman. This poem on the 'Paper-Myll' is in no fewer than forty-four stanzas, ten of which describe the water-wheels, the beating of rags by stampers, and the production of the finished sheet. The fourth stanza introduces the subject:

I prayse the man that first did paper make,
The only thing that sets all virtues forth;
It shoes new bookes and keepes old works awake,
Much more of price than all the world is worth;
It witnesse bearcs of friendship, time, and troth,
And is the tromp of vice and vertue both;
Without whose help no hap nor wealth is won,
And by whose ayde great workes and deedes are done.

PEDRO THE MULETEER.

CHAPTER II.

FOR a whole year did Pedro make his daily journey down to the city docks, returning in the full blaze of the day to the mountains. At times—which he treasured in his memory as things of incalculable worth—he caught a passing glimpse of the woman who had saved his life, and on one glorious day she smiled full in his face as he knelt on the kerb when her carriage passed him. She knew him! He went about for a month with a song in his heart, and wondered how best he might serve her. The time was coming, had he but known.

Pedro was not deaf to the common rumour, as it flew about the dockside *posadas* and the city taverns. He knew as well as any man that the people were groaning at the so-called tyranny of the President, who was doing his utmost for the ultimate good of his nation. Besides, there had arisen a new leader in the land, a man of the people, who promised them much that was good and nothing that was evil. General Manuello had risen

from the ranks because of a certain bulldog courage, and this success had fired his blood with a wilder ambition. Then, too, a certain section of the community were wont to flourish on the misfortunes of others, and a revolution was a happy hunting-ground for these wild spirits. Manuello's fiery oratory, poured forth in the quiet cafés of the water-side, fired the malcontents' hearts with mad lust for battle and spoil. Murmurs were heard when the presidential carriage passed through the city; and once, when one of the President's horses accidentally struck down a gutter-snipe, the murmurs rose into an open roar of rage. It mattered nothing that the carriage was stopped and the boy lifted in to be carried to the great public hospital; Manuello made this accident the theme of his most impassioned appeal to his followers, and the meeting broke up in waves of animal passion.

But Pedro knew that the President was a strong man, and waved the ominous forecasts aside airily as he rolled his interminable maize-leaf cigarettes. '*Holà!*' he exclaimed once suddenly, to the great surprise of his mother, and after two hours' steady thinking, 'let him but ask Her Excellency to unveil her sweet face, and the people would worship him again.'

But when one morning brought to Pedro's ears the dull roll of musketry from the city beneath, he dimly understood that things were going awry with his country. He knew that there would be no work done about the docks that day; so he donned his cleanest shirt and his smartest jacket, and made his way down the hill on The Wolf's back to a certain snug café which he was wont to patronise in his moments of affluence.

'How then, Pedro?' said the woman of the house when he entered. 'There be great doings afoot. Already the people have turned against *el Presidente*, and it remains but for the soldiers to go with them. It is a matter of no moment to me, who have seen many revolutions. A little blood spilled in the streets, a few red splashes on the white walls, much custom at the cafés, and then—peace once more.'

'What would the fools have?' growled Pedro. 'They will run their necks into a smaller noose, that is all. This Manuello, I know him, by the saints!—a villain of villains, without blood or breeding. Woe to the men on whom he climbs!'

There arose outside the vociferous outcries of a revolutionary city and the tramp of hurrying feet. Scattered shots sounded above the tumult like the bark of an angry dog. Then a mighty cheer, which echoed and re-echoed throughout the labyrinth of white-walled houses, resounded; it swelled and grew like the lashing of a stormy sea on a pebble-ridge.

Pedro started to his feet as he heard some incoherent words from outside. A man was hurrying past the door—a man who brandished a deadly *machete* in his hand, whose very elbows were wet with something red and sticky. As he saw Pedro he started back a little, and then, with the knife upraised, made a fierce cut at the muleteer's head.

'*Diavolo*,' he yelled, 'it is the accursed President himself!'

But Pedro had been trained in a hard school. As the blood-stained hand flew up he threw his scarlet-lined *capa* about his arm and guarded his head. The knife sank into the soft folds, and at the same instant a hand that had no equal in all Puerto Bianca shot forth and seized the lifted wrist in a death-grip. There was a loud scream from the would-be assassin, a feeble snip, and the arm fell useless at his side.

'Fool!' muttered Pedro, 'dost not know Pedro the Muleteer and his grip?'

The man's face was distorted with pain and chagrin, but a slow grin creased his cheeks. '*Caramba!* It is indeed Pedro. Hide that face of thine, my friend, or others will make the same mistake as I. It is bad to have a face like the President's to-day, Pedro *mio*. He will assuredly be shot, that President.'

'What then, ass?' asked the muleteer, tenderly examining a rip in his cloak. 'His soldiers are still true. No?'

'The soldiers are wise men. They revolted half-an-hour ago. Already the palace is in their hands, and they have opened the gates to the citizens. There is much plunder. I must go. Devils a thousand! how am I to take my share with a broken arm? You have done me an evil turn this day, Pedro.'

'And—and the President?' asked Pedro, unheeding the other's almost tearful remonstrance. A sudden fear had seized upon his heart, so that he was choking. As in a vision he saw a sweet young face, the eyes alight with pity that was all but divine; and he knew—for was it not the current rumour of the city in happier times?—that the young wife worshipped the very ground on which her husband trod. If the men on whom Balcazia relied were untrue, what of the man who had pinned his faith on them?

'The President!' said the man with a grim chuckle. 'Ah! they have caught him. He would not run; he would not fight. He is now in the prison, where he has sent many honest men. To-morrow, with the dawn—eh?'

He made a gesture with his hands, and stood himself against the wall of the café with folded arms and closed eyes. Then he gave a dramatic start, leaned forward slightly, and sank slowly downward in a huddled mass.

'So!' he explained. 'You understand, Pedro? He is an enemy to the cause; therefore he must go—thus.' And he rolled a few grains of dry tobacco with his sound hand and blew them into the air. 'Poof! it is all over by to-morrow.'

A fresh roar of cheering broke from the streets ahead, and the surging tide of men who were rushing past madly paused and turned. Here

and there were men who had gone mad with blood-lust, and these irresponsibles were firing revolvers into the midst of their fellows. Already the gutters at the sides of the street were streaked with red, and here and there a fallen man lay in the middle of the road. The mob took no heed, but rushed on, trampling the dead under foot with grim callousness.

'It is Balcazia,' gasped the man whom Pedro had worsted, as he reeled back into the café from the press of the crowd. 'He goes to his trial.'

Pedro sped forth into the street and joined the tumult. He made for a cross-street, and forced his way through the raging medley of maddened men as a cruiser ploughs her mighty way through the foaming surges of the stormy seas. Men shrank back from the glare of his eyes; they fell before the sweep of his great arms. So he reached the Plaza, and there he saw what he had come to see.

A rough platform had been erected before the Government palace. It was shrouded with black and surrounded on every side by the mutinous troops, who leaned on their rifles and cracked foul jests with the screaming mob. But Pedro had no eyes for the revolutionists; he saw only the one tall, fearless figure on the dais. Manuello, a cruel grin on his crafty face, was seated in a gold-coloured chair, and was reading a long indictment from a parchment he held in his hand. Balcazia was proudly unconcerned, even though, when the newly elected President paused in his reading, the entire crowd in the Plaza broke into a blood-curdling yell. These were the men whom he had striven for with all his strength. He had wasted the best years of his life on their behalf, but they had forgotten that. A new idol had arisen; the old must be trampled down from its high place.

Wave after rolling wave of hoarse cries reverberated through the square as indictment after indictment was read out in a sonorous voice that rattled across the tossing sea of humanity like thunder. They were all lies, but no man spoke a word in the fallen man's behalf.

'And the verdict of the people is?' asked Manuello briskly, rising to his feet and pointing dramatically at the fearless ex-President.

'Death!' The scream came from every throat save one. 'Death! Down with the tyrant!'

'Shout thou too,' cried one evil-faced fellow, advancing a threatening face towards Padro, 'or, by the saints, this goes through thy heart!'

Pedro waved aside the levelled poniard with one hand, and smiled calmly.

'Shout!' again cried the murderer—his clothes were decked with finery torn from ladies' garments.

But as he spoke a second time he advanced his face still more, and laid bare the vulnerable spot beneath the ear. Pedro struck once, and the man sank to the ground without a moan.

In that reeking atmosphere of blood there was no time for nice discrimination, and Pedro's action passed unnoticed. He surged forward on the resistless tide of men, and strained his eyes to see over his fellows' heads. A fear that he could not name was in his heart; but he thanked God the wife of the President was not on that draped dais. Evidently she had escaped, or—— Pedro's knees trembled under him. If she were dead!—struck down by the frenzied murderers!

He broke through the crowd, hearing as he went Manuello's last words:

'To-morrow, at the dawn, then. To be shot.'

The muleteer made for the palace steps, and confronted the sentry there.

'Her Excellency—she is dead?' he asked breathlessly.

The soldier curled his fierce mustachios and said killingly, 'No; she escaped. It was the doomed man yonder who sent her away in time. But, my friend'—he tapped Pedro confidentially on the shoulder—'knowing what we know—that she loves him, eh?—it were better for her that she died with him. She will live in hell.'

Pedro had heard all he desired to know. His angel, his divinity, was safe. No idea was yet born in Pedro's brain, for he was but a simple man, whose face was like the President's, a fact on which the sentry commented as the muleteer turned away.

'Hide thy face,' he cried warningly. 'It is a dangerous one.'

Pedro mounted The Wolf and broke through the howling masses. Out and away from the reek of blood and smoke he rode at a hand-gallop, his heart full of a song of thanksgiving that his goddess had escaped; and so riding, he came to the *posada* on the hill where he had rested after his wound. The girl was no longer there, but the old man who owned the place had much to say. He spoke ramblingly of revolutions in the past; but when Pedro turned to go, and threw down a peseta impatiently, the old fellow grinned.

'A girl on a horse, her hair flying in the wind, her eyes starting with fear!' he cried, shaking a palsied hand towards the hills. 'She passed an hour agone. Her face was like Death himself.'

'What manner of face was this?' said Pedro.

'Very fair indeed. *Si, si;* but such a face as a man might love to have upon his heart. A beautiful face, with raven hair about the white brow. She rode a mottled roan.'

Pedro remembered the mottled roan. It was rather a curiosity in that place, where the horses were chiefly bays or browns. What if this flying fugitive were Her Excellency herself?

He leaped upon The Wolf and struck the big spurs home. Like a thunderbolt the mule leaped forward up the slope, and the watching innkeeper saw nothing save a cloud of sun-sparkled dust.

'He is a deep one, that Pedro!' he said as he ambled back to his brazier.

(To be continued.)

OUR MOTHER MOSCOW.

By MAY BALDWIN, Author of *Peg's Adventures in Paris*, &c.

PART I.

'MON dieu! it is madness—sheer madness.'

It was a bright, spring-like day, although it was midwinter, and the boulevard in Paris where the above words were spoken was gay with the spring toilettes of the light-hearted Parisians, who on the smallest encouragement put on cheery spring garb.

'It is madness,' they repeated when I announced my intention of leaving their gay capital and going to Moscow, and that as soon as our ambassador should be convinced that I was a fit and proper person for the British Government to extend its protection to in the shape of a passport.

'Wait at least until the weather is warmer,' they protested, 'and then things may be more settled. Why, it is full revolution there now! The trains may even stop, as they did last year, and you will not be able to come back.'

Thus, and with many more warnings, did they implore me not to be so rash as to run into certain discomfort and possible danger. But 'woman convinced against her will is of the same opinion still,' and two days later saw me off to the 'Heart of Russia,' having but one word of Russian to carry me through that always disturbed country. That one word was *da* ('yes'), and it has its limitations.

'I must say,' I observed to my travelling companion—a pleasant Russian lady—as I peered gloomily out of the window of the German train on our way through German Poland, and saw snow, snow everywhere—'I must say that it was more cheerful in Paris.'

'Having previously explained, in answer to her inquiries as to why I was going to Moscow, that I wanted a complete change, she reminded me of the fact, and began to talk enthusiastically of 'Our Mother Moscow' and the beauties of the Kremlin, to see which had long been one of the desires of my heart.

At last we heard all along the train the word 'Alexandrovna' and knew that we were at the Russian frontier, so braced ourselves up for a tussle with the Russian custom house.

They seem to be in no hurry to augment their population—the Russians—to judge by the time they kept us and our train waiting before they took any notice of us, though the sparseness of their population, we thought, might have suggested the advantage of encouraging desirable visitors.

But this same desirability is a point upon which they have strong doubts, as is well known, and just now they are more nervous than ever. We were locked in our train, and three Russian soldiers—tall, bearded men in long, thick, blanket-like overcoats, with black leather belts, black astrakhan caps, and regulation sabres—came to the door of our compartment and demanded 'Passports,' which word is wisely the same in most European languages. They were examined always with the same suspicious air that is so irritating to the average free-born Briton, who is accustomed to be considered an honest man until he is proved to be a rogue, and objects to be considered a rogue until he is proved to be honest, as is the way in Russia.

As an example of their point of view on this matter, here is a 'discussion' I had with a Russian official when I wished to leave Moscow for England without having asked the leave of the police, which leave they refused to give because I had not mentioned to them that for the last three days I had gone on a visit to friends and (heinous offence) 'slept in an unknown house' without previously notifying the police. Indignantly I pointed out the distinguished position of the Russians with whom I had been staying. With stolid countenance, though perfectly polite, he replied in French, 'Madame, you did not tell us you were going to stay there. *Why* did you not tell us [that is, the police] that you were going to stay with this lady?'

Naturally I replied that I had not seen the necessity, nor did I see it then.

Patiently he explained, 'Madame, we must know what you were doing those three days.' When I in my turn demanded 'Why?' he replied in the tone of one giving interesting information, 'You might have committed a murder.'

'In that case you ought to be glad to get rid of a dangerous criminal,' I suggested; and then, my patience being out, I added, 'And if you were to spend your energies in looking after real criminals of that sort (instead of wasting your time on me), and keep them in your own country, we should be obliged. We are not keen to have your Nihilists in ours.'

What might have been the result of this rash remark will never be known, for a suave member of a foreign consulate—not the English—who had been listening with amusement to this passage of arms, and at my request not interfering, as I was 'sure I could arrange the matter myself,' now interposed, and handing his card to the official, settled the matter in two minutes.

But to return to the custom house, out of which one does not get much more easily than I did out of Moscow, I got off fairly well compared with our two travelling companions, both Russian ladies, one of whom tried to smuggle, and was so heavily fined for having hidden a new silk gown that she had to leave some of her wardrobe for

which she refused to pay; and the other of whom, a gentle, timid-looking little woman, unfortunately had the same name as a 'wanted revolutionary,' and was only allowed to pass on with her passport after she had been well scrutinised by a number of officials and her features compared with those of the suspected person. After this I was relieved to escape with having my boxes ransacked—which they do most thoroughly—so that one wonders how any contraband literature or other matter gets into the country, as get in it does.

As a matter of fact, though my boxes were eventually passed as innocent and labelled to that effect, for reasons unknown to me two of them were detained at the frontier and only followed two days later. When they did arrive they were frozen, and the effect of touching the icy contents was to make one start with cold, and hastily carry the clothes to the hot-air pipes to thaw.

Having received my passport back, to my relief—for I had begun to realise its importance—I made for the Russian train, and from that moment until I left Russia I ceased to breathe (figuratively speaking) while under Russian roofs.

No words can describe the heavy weight of the air, nor the torture it is to English people fond of fresh air to be imprisoned in a Russian interior, whether it be a train, hotel, house, or public building, in winter; but some idea may be gathered from the fact that for the six winter months all windows are double, hermetically sealed, and have wadding between the two windows to prevent the slightest breath of air penetrating into the interior.

Oh, that two days' journey from Alexandrovna to Moscow! No air within, and nothing to distract your attention without. Every traveller has expressed his feelings on the subject of the long, endless, weary, dreary, snow-clad plain with forest and apparent desert, apparent desert and forest, succeeding each other in monotonous melancholy procession, and never a town or village, in the English acceptation of the word, to relieve the monotony of the scene. Even Russians own to feeling the depressing effect of the landscape, and do not attempt to defend it or find beauty in the ocean of snow which stretches as far as one can see to the horizon. Occasionally a lonely peasant wending his way through a field of snow would be seen, and arouse one's compassion for his solitary lot and one's curiosity as to where he could possibly live; or a sledge with a muffled-up driver would be driven across the plain, where no roads or hedges could be distinguished, and only a few snowy heaps told the initiated that some *isbas* or peasants' huts were there, half-buried in the snow.

How glad we were when one of the conductors came to collect tickets for Warsaw, and we were informed that we were near the Polish capital, though we could see no sign of a great city being near! We had to change trains here, which would make a diversion and give us breathing space.

A friendly Russian lady in the train took compassion upon my helplessness and limited vocabulary, and told me that if I liked to join her in a sledge she would take me across Warsaw to the other station and see me into the train for Moscow. Needless to say, I accepted the offer with gratitude and alacrity, and we were soon jolting along the streets of Warsaw (Varzava, as it is pronounced in Poland), in a sledge through a bitter snowstorm.

It was half-past eight o'clock in the morning, but we had not gone far before my companion, touching my arm, said, 'Look—prisoners;' and following the direction of her eyes, I saw for the first time a Russian political prisoner being conducted to the police office. Whether because he was the first or not I cannot say, but he made a deep and painful impression upon me. He was a tall and intellectual-looking Pole; my companion surmised him to be a professor or barrister, and he looked very ill as he walked along free so far as his custodians were concerned, for the two gendarmes or soldiers—I could not tell which, for at that time I had not learnt to distinguish the uniforms of the two, both consisting as they do of long overcoats and fur-edged turbans—walked behind with a yard between them and their prisoner, though near enough for their fixed bayonets to transfix him if he was so ill-advised as to try to escape.

He was the first, but in that quarter of an hour before nine o'clock in the morning we saw no less than five political prisoners, the other four having students' *serviettes sous le bras* (that is, the black brief-cases used by students abroad).

We were both glad to say good-bye to poor Poland and delighted to find that by our speedy crossing of Warsaw we had just caught the Moscow express—save the mark!—and were soon off to Moscow in a *train de luxe*, as my new friend called it; after hearing which I wondered what an ordinary train was like. I wanted out of curiosity to travel in one, but the sight of it damped my ardour; a cattle-truck in England would be preferable.

Our 'express' stopped about every half-hour at what was ostensibly a station, but as no passengers alighted or boarded the train, some of us who wanted to get to our destination failed to see the object of these endless delays. How tired we were of the glaring snow plains and the skies laden with unfallen snow, and how glad we were when, after another day and night, we were told that we were near Moscow!

Here again there was no sign of an important city being near—no suburbs, no habitations even—but we soon came to the station at Moscow, and I saw my friends on the platform. Then I learnt my second Russian word, the word I heard the oftenest in Russia. It was *Pojaluista* ('please'). The Moscow equivalent to a 'cabby' taught me that.

In order to engage a sledge a good deal of bargaining is absolutely necessary, and the same performance is gone through a hundred times a day no doubt by the sledge-drivers. The hirer mentions his destination and the sum—from twopence halfpenny to

eightpence—which he proposes to pay. The driver doubles it, you repeat your price, he descends kopeck by kopeck until, tired of the discussion, you walk away, he following at a walk till finally he says, '*Pojaluista*.' He has accepted. No one thinks of walking in Moscow, so that first day I had six drives in six separate droskys or sledges, and six times did we, or rather my companion, go through exactly the same ceremony, and so did everybody else. It sounds futile, but such is the custom in Moscow, and at all events it is less unpleasant than dealing with some London cabbies.

There is a Russian proverb which says, 'He who has not seen Moscow has not seen what is beautiful.' That may be a matter of dispute, but the day I arrived at Moscow, after a timely thaw which had melted the snow on the roofs of the houses and the domes and cupolas of Moscow's four hundred and eighty (so they say) churches, it was bright and frosty, and Moscow was beautiful with an Oriental beauty.

It is probably the first impressions which are the most truthful, and what struck me most that first day was the predominance of green—green roofs, green walls (to some of the houses), green domes to the churches, sometimes spangled with gold or silver stars, sometimes not, and green on the officials' gray uniforms. Later on I became aware of a perfect riot of rich colours, pink, blue, gold—in fact all the colours of the rainbow; but I remember that my first remark was, 'How fond the Russians seem to be of green!'

Opposite my hotel was a pink church with sky-blue cupolas spangled with gold stars. I grew to dislike that church after a time. I mean its colouring, and only forgave the artist when it helped me to 'find myself' one day when I had hopelessly lost myself and could find no French or English speaking person to tell me where I was.

I was told that any well-dressed person would be sure to speak either French or German. I do not wish to be critical, but people in Moscow do not dress well in the street; or, to put it differently, well-dressed persons do not walk in Moscow. In winter, as a rule, they take horrid little sledges, only wide enough for one person, properly speaking, unless they are rich enough to have their own sledges.

The second thing which struck me was the beggars, and they taught me my third word, *niet* ('no' or 'not'), which I invariably said when they asked me for alms. Lest I should be thought stony-hearted, I may mention that one day I gave to a most deplorable-looking object, whereupon during that (my first) walk alone in Moscow no less than fifteen beggars followed me, to my great alarm. Before I ventured out alone again I had learnt to say *niet*, and it was quite enough; they always took it for a final answer, without insolence or dispute, poor creatures!

A Russian told me that it is only since the revolution that they have become so troublesome, for now the Government 'dare not interfere with them, and they swarm in the streets'! Once I counted the number outside a church on a feast-day. There were forty, and they stood in two orderly rows, through which the worshippers had to pass, each with his fur-edged cap in his hand.

The third thing I noticed was that no one seemed to laugh in the street, or if you did see a smiling face it was that of a French or German man or woman. I asked whether this also was the result of the revolution, but was told that the Russians are 'like that.' Perhaps this struck me more from the contrast between Moscow and Paris, where people smile through life.

Perhaps also it was owing to the fact of my having spent the previous few months in the Vosges Mountains, where the cold was intense, that I did not feel the cold so much—that first day, I mean, for there came days when I did indeed feel the cold till it numbed me so that I felt nothing.

We drove up, with the flourish peculiar to Russian drosky-drivers, to the door of my hotel, and half-a-dozen hall porters of kinds came forward to help us to descend from our sledge—which, as it was not a foot off the ground, was not such a difficult matter—to take my luggage and my goloshes (which I did not happen to wear, to their surprise), and to usher us into the hall. When I left the hotel there were ten men in the hall and a row of servants in the passages, of which custom I had fortunately been warned and told to provide myself with change to tip them—not such a deadly matter after all, as they are satisfied with a small coin.

My rooms, one inside the other, had been engaged, and I was glad to get to them and see a bed again, and if the windows had opened, instead of being, as usual, hermetically sealed and double, I should have been quite happy.

'You will soon get used to it,' my friends assured me; 'you must wear very thin things in the house and only dress warmly to go out.'

Excellent advice no doubt, but as one generally went out to see people or 'sights' (that is, public buildings), which meant going into other overheated and underventilated rooms, the advice was not so practical as it sounded. The Russians, of course, are enveloped in furs from head to foot, and spend enormous sums on furs; but these are not 'walking' attire. However, as I have observed, one does not walk much in Moscow, so I soon took to a cumbersome wadded cloak and light house dress. Thus protected from the wind, I felt a sledge drive to be most exhilarating, especially with the sun shining brightly and making the snow sparkle and causing icicles to form on the eaves of the houses. I never saw such enormous icicles in my life nor such fantastic shapes as they assumed, those first days when Moscow was recovering from the sudden and unexpected thaw to which I was so grateful for letting me see the minarets of Moscow and the Kremlin in all its glory.

(To be continued.)

LONG-RANGE PHOTOGRAPHY.

By Captain OWEN WHEELER.

ABOUT seventeen years ago the scientific world was a good deal interested by the introduction of a new form of photographic lens which bore to the ordinary lens much the same relation that the telescope bears to the ordinary eye. Previously it had only been possible to photograph objects at long ranges by using lenses of very long focus, which required an equally long extension of the camera. To render satisfactorily an object only a mile or two off a lens having a focal length of five or six feet might be necessary, and a camera with that extension, however beautifully built, is a cumbersome piece of apparatus. In such cases enlargement is a help, but it has its limitations. If you take a photograph with a lens of, say, eight inches focus, and then enlarge it nine times in order to get the same effect in point of size as would be obtained with a lens of six feet focus, the result will be woolly and unsatisfactory. For in the film of the finest grain plates there is a granularity, due to the sedimentation of silver particles, which when enlarged more than five or six diameters become disagreeably perceptible.

Accordingly, when Dr Miethe in Germany, and the late Thomas Dallmeyer in this country, began to discuss the telephoto lens, as it came to be called, the new arrival was rather eagerly welcomed. In theory the thing was fairly simple, and the process by which the ordinary photographic lens was converted into a sort of photographic telescope was not at all difficult of comprehension. In its simplest form, indeed, it was and is quite captivating in its artlessness. Behind an ordinary photographic lens is placed a 'negative' lens, and a greater or less separation between these negative and positive elements, coupled with a corresponding adjustment of the camera extension, produces a greater or less magnification of the image produced by the ordinary lens when used alone. With a single telephoto lens a number of different magnifications can be produced; and by using a 'high-power' combination, and a fairly long camera extension, marvellous results, especially in the clear air of Switzerland, were obtained in the early nineties by skilled enthusiasts.

But in practice the telephoto lens often proved disappointing, and it soon dropped out of favour, in spite of the heroic efforts which the late Mr Dallmeyer made to popularise it. In reality it is rather a complicated instrument, which, if the best results are looked for, has to be constructed with the very greatest precision, and which even then needs expert handling to produce pictures which can be readily mistaken for those taken with the ordinary lens. The latter as manufactured by a good optician is full of beautiful 'corrections' for chromatic and other aberrations, and when a negative lens is added in order to convert it into a telephoto system those corrections are liable to be disturbed. Then, again, the amount of light which is passed by a telephoto lens is small compared with that passed by the ordinary lens when the latter is employed by itself. To use the technical formula, it varies inversely as the square of the magnifications. In other words, in taking a telephotograph at five magnifications the exposure has to be, *mutatis mutandis*, twenty-five times that which would be needed in an ordinary photograph of the same subject.

Lastly, as the rays which go to form the telephotographic image enter the lens at a very small angle, a good deal of superfluous light is sometimes admitted, which causes internal reflections and consequent flatness or veiling of the negative. This used to be a common failing in almost all telephotographs, and was perhaps the principal obstacle to the early popularity of the telephoto lens. It was, to say the least, disheartening, after buying a costly telephoto attachment and mastering its peculiarities, to be able as a rule only to get negatives more or less marked by that ugly obscuration which is familiar to all photographers under the name of 'fog.'

The telephoto lens still needs careful handling, and cannot be readily used at any but very low magnifications for snap-shot work. But latterly the simple expedient of using an extended hood to prevent internal reflections has practically banished the demon of 'fog' from the region of telephotography, and one can now get just as bright pictures with the telephoto as with the ordinary lens. Opticians, too, are producing new and distinctly improved negative lenses specially calculated to work harmoniously with certain positive lenses, with the result that telephotographs taken with a comparatively short exposure at about ten magnifications can now be fully enlarged three or four diameters without any serious loss of definition. In this way enormous magnifications can be produced with the help of an attachment of only moderate power. But a high-power lens has recently been patented which enables direct high-power telephotographs to be taken in an ordinary half-plate camera, and in these pictures a distant object is rendered the same size as it would appear if taken with an ordinary lens having a focal length of six yards!

Naturally, military men are interested in the possibilities of the telephoto lens, and both in this country and abroad a good deal of quiet attention is being given to it. The need for increased exposure makes it difficult to use the lens for balloon work, but even here there are signs that practical

results will eventually be attained. Those interested in the potentialities of balloon photography will find the subject very fully discussed in *Airships Past and Present*, by Captain Hildebrandt, of the Prussian Balloon Corps. But incidentally they may take it from the writer that instantaneous telephotographs can now be taken under favourable conditions which will nearly, if not quite, satisfy the requirements of the military aeronaut.

The extent to which telephotography may become serviceable to the Navy is at present doubtful; but there seems little question that eventually the telephoto lens will play an important part in naval reconnaissance. The fact that a ship standing several miles out to sea can secure a permanent record of an important piece of coastline is alone of some significance, to say nothing of the opportunities which the telephoto lens affords for studying details of forts, harbours, and naval construction without exciting observation. Apart from the more serious purposes of the fighting naval service, telephotography offers a new and delightful pastime to the yachtsman, who at present does not take the trouble to photograph much of the littoral which he passes, because he knows that with the ordinary lens the result would be a mere uninteresting thread in which details would hardly be discernible with a strong magnifier.

Travellers, and more especially explorers in mountainous regions, will soon come to regard the telephoto lens as the most important detail in their photographic equipment. Already telephotography is successfully employed in the Alpine region for the purpose of mapping out the details of peaks for the benefit of future climbers. But this is a circumstance compared with the services which a carefully selected telephoto lens might render on an expedition such as, for instance, that with which the name of the Duke of the Abruzzi is associated. Architects and engineers, again, have many uses for the power which telephotography places in the hands of a skilful and intelligent operator. It must often occur in the course of great building and engineering operations that a record of progress is desirable which with the ordinary photographic outfit is only to be obtained, sometimes at considerable risk, by means of scaffolding, cradles, or other contrivances. Here the telephotographer steps in and easily does what is necessary from firm ground, simply because he is to all intents and purposes turning the ordinary lens into a very effective sort of photographic telescope.

It is almost needless to expatiate upon the value of the telephoto lens in natural history. The public are already familiar with some excellent examples of bird and animal telephotography; and, now that the telephoto lens is becoming better known, it is probable that a considerable impetus will be given to its employment for this class of work. At the same time it must be borne in mind that it is in this particular connection that the limitations of the telephoto lens are specially obvious. The lens, as already explained, is essentially and necessarily a 'slow' lens, owing to the decrease in the amount of light which it passes as compared with that passed by the 'positive' lens when used alone. The advantage of being able to photograph a bird or an animal at sixty yards instead of at thirty feet is sometimes rather dearly bought by having to give an exposure nearly forty times longer than it would be in the latter case. Still, the telephoto lens in natural history has amazing possibilities, and opticians are preparing to meet the demand which will inevitably occur for objectives specially adapted to this purpose. Quite recently the great Jena firm of Carl Zeiss has placed upon the market two tele-objectives with foci of about eighteen inches and thirty-five inches respectively, which work at the comparatively large aperture of f/10, an optical achievement which can only be fully appreciated by those who have made instantaneous telephotography a special study. Several English makers also have lenses which, properly combined and properly handled, are sufficiently rapid to enable capital bird and animal studies to be made without unduly attracting the notice of the shy creatures concerned.

TO PEACE.

Oh, must thou only reign when darkness comes!
Can the white moon alone thy blessing win,
When fair above the city's towers and domes
The evening star shines? Nay, thou shouldst begin
Thy tender benediction with the dawn,
When the awakening world stirs in its sleep,
When the sun's beams across the wave-crests leap
And turn the dew to opals on the lawn.

Come forth at sunrise and at noon, and be
A shield to anxious hearts and brains that strive
Through weary hours, when most we crave for thee
To keep the pulses strong, the soul alive.
Whisper the magic words which can dispel
The doubt-mists of the mind and calm wild fear—
Thou, who dost bless the forests bleak and sere,
Thou, who dost guard the wild-flowers in the dell!

Wrapped in imperial robes, serene of brow,
A goddess, dwelling in far realms divine!
So high above the restless world art thou,
Dost thou not care that mortals fret and pine?
That we must seek thee veiled, with bated breath,
Lest ugly scar or sigh should fright thy grace?
That we must woo thee in some darkened place,
And win thee only with the plea of death?

'Tis life that needs thee! As a mother fold
The tired children closely to thy breast;
And, as a maiden loving, proudly hold
The lordlier souls who give the world their best.
Oh, come across the mountains and the sea,
And dwell beside us all the busy day!
Then, when the azure deepens into gray,
Lead us to thy still land of mystery.

Constance Farmar.

Chambers's Journal
SIXTH SERIES.

AT THE DAWN OF BRITISH HISTORY.

By Sir ALEXANDER MUIR MACKENZIE, Bart.

DR THOMAS RICE HOLMES, assistant master in St Paul's School, London, author of a learned work on *Cæsar's Conquests in Gaul*, which has met with high approval, has followed it up with an equally interesting and important book on *Ancient Britain and the Invasions of Julius Cæsar* (Oxford: Clarendon Press). In his inquiries regarding Ancient Britain he has made his work practically an account of the country, as far as was possible, from far beyond the date to which the creation of man used to be referred, down into historic time; from tertiary and quaternary strata, through the Stone Age, the Bronze Age, and the Iron Age, down to the tribes that resisted the Romans, who threw the first illuminating glance upon our condition at the dawn of written history. On the main questions discussed in the book hardly any certainty can be attained, for the author points out that 'it is impossible to define with anything like arithmetic of chronology, to fix the exact date of the commencement, the duration of, or the transition of any age.'

We present a few notes gleaned from or based upon the eminently suggestive epitome of our unwritten history by Dr Holmes.

It is coming to be generally admitted as probable that there was in the Tertiary period a creature who may be termed man, the progenitor of the more highly developed man of the Quaternary period, with its Ice Age or ages. One of the earliest efforts of the Palæolithic man, the man of the older Stone Age, would be to make use of some kind of weapon to defend himself against the carnivorous animals more powerful than himself, and accordingly he began to fashion flint and other stones into knives, hatchets, and arrows.

Those who made the very first efforts are named 'eolithic' man, and their rude attempts at tools 'eoliths' (i.e. 'stone implements of the dawn of time;' as palæoliths are 'ancient stone implements'). Mr Harrison of Kent, who has been investigating different finds of flints of the Palæolithic Age, as well as those of the Neolithic, has classified those relics found in the Kentish chalk as eoliths — flint implements of a ruder or more primitive type than even the palæoliths. They seem to have been in existence at a time when Britain was receiving its last touches from the mighty scalpels of the disappearing Ice Age; but flints, wherever found, must always be received with caution, as it is by no means certain that all of these show marks of human workmanship.

There are two kinds of chips, or flints—those of nature and of man. On Dartmoor and in Cornwall the granite chips, here named 'clatters,' lie in confused masses round their parent tors, and no man can guess the age of these fragments, which, due to purely elemental causes, can by careful inspection be distinguished from the very rudest of human efforts. But the value of the human-made chips is a convincing evidence to those who can read. In one of the Cheddar caves in the Mendips there is a well-worn seat, fashioned out of a block of stalagmite, some feet in thickness, on which must have sat the primeval man, chipping his flints—'massy fragments of another world'—into arrow-heads, spear-points, or knives, of which numerous tiny chips at the base of the seat buried in the débris of centuries testify to this day. Naturally, 'chipping' infers a hammer.

Another step forward, and we find man in a state of transition, but improving on his predecessor in his weapons, arms, and ornaments. Greater care and skill were used in preparing the flints and antlers for tools or spear-heads. The relics found in the valley of the Somme and in every quarter of the inhabited globe bear witness to this. According to Johannes Ranke, in the caves of Mentone and Gibraltar, and Kent's cavern, man was further engaging in the development of his religion, in commemorating the attributes of his gods, and paying respect to the deceased. Honour to the dead was as much a religious sentiment in the Neolithic Age as it is to-day among the Japanese, while the different branches of the Aryan or Celtic

 [*All Rights Reserved.*]

families have left behind them many mighty monuments of this idea. To confine ourselves to Ancient Britain, the dolmens, barrows, men-an-tol, cromlechs, monoliths, and circles are 'stones crying out' to us to demand their meaning. From Land's End to Orkney we find these expressions of worship, of a cult lost to us, and of which we have hardly a key.

'It is easy to laugh at the guesses of Camden and the theories of Stukeley; but they were only framing the hypotheses which are as necessary for the progress of archæology as of other sciences;' they were indeed, Dr Holmes reminds us, the pioneers of antiquarian lore. He specially notes such circles as the 'Hurlers' in Cornwall, associated as it is with legend of the very earliest British Age —a rough double circle of undressed monoliths; Stanton-Drew, with its elaborate circles, attributed to the sun, moon, and planets; together with an avenue styled the 'Weddings,' having its counterpart in many parts of the world, set up with huge masses of breccia, each huge stone hauled, as old writers tell us, by one tribe. Similar methods were employed by the Egyptians of old in moving huge monoliths, and Professor Gowland in his *Stonehenge* shows illustrations of these.

The barrows are a distinctive feature of the Neolithic Age, in their various shapes, according to the custom of the tribe or individual. Dolmens and cromlechs mark places of sepulture. The dwellings of this period assume some better form. Weapons, implements, and ornaments show attempts at decoration; but toward the end of the period working in metal had made its appearance and so marked the beginning of a new epoch, known as the Bronze Age.

It appears, though not in Britain, that there was a Copper Age, before the alloy of copper and tin was discovered. The oldest piece of bronze to which a date can be given is believed to have been cast in Egypt in 3700 B.C. Working in metal naturally produced a great improvement in all kinds of tools and weapons, as well as ornaments, amber (electron) and gold being found on the latter; while axes, spears, and javelins were pushing out the stone weapons. The 'beehive' huts and hut-circles—of which 'Grimspound' on Dartmoor is a notable example—belong to the Bronze Age. Broken pieces of pottery are found in different localities, and numerous vessels of metal, more or less ornamental, show the step forward.

The great temple, in double circle, of Stonehenge is treated by Dr Holmes as a sort of climax to the Bronze Age. The huge trilithons, fixed as they are by mortise and tenon, show a decided advance on the equally large undressed blocks of Avebury, scarce a score of miles away; to be surpassed in due time by the acme of pure architecture, the Early English of Salisbury Cathedral (in 1225–70). The standing stones of Stennis in Orkney are not commented upon.

It was in this age that Pytheas, a Greek, sailed from Massilia (Marseilles) to explore the British (Tin) Islands. Passing through the Pillars of Hercules, he coasted Iberia (Spain) and Gaul, and explored the coast of Britain as far north as Ultima Thule. Whether this be Shetland, Orkney, Iceland, or that mysterious place called the 'Green Island' (by a latter-day writer) is a matter of conjecture, and is not determined; but doubtless he obtained a very good idea of the form of our islands, the probable riches therein, and last, but not least, of the races inhabiting them. The island is supposed by some to be called 'Bretanic' from *Qrtanoi*, possibly the Brythonic or Gaulish equivalent of the Goidelic or Irish *Cruthni*.

His voyage marks a new era—the Age of Bronze is passing, and making way for the early Iron Age; although, as found in the camps of southern England (notably at Cranbourne Chase, excavated by General Pitt-Rivers), there still remained stone and bronze implements for some time to come.

The working in iron—mining, smelting, and fashioning—was probably introduced into Britain by the Gallic invaders five or six centuries before Christ (of whom the best known are the Belgæ); and the innovation naturally had a great effect on the form of implements and weapons.

About 400 B.C. coins were introduced bearing the head of the Greek Philip, although already there were extant some coins of the Bronze Age; but the first actual British coin does not date before 200 B.C. Though there were still cave-dwellers in various parts, dwellings and towns were being formed, and 'hill-forts,' strongly entrenched, such as Worlebury on the Severn, Carnbrea in Cornwall, the vitrified forts in Scotland, and exemplified by the city of the Picts; this might be Abernethy or Inchtuthill, Perthshire. In these are found ornaments, such as brooches, wheel-shaped pins, bracelets, and decorations in many forms, all showing a considerable advance upon the work of the bronze period.

Religion was much influenced by the Roman mythology, and the British deities became mixed up with the classic gods, such as Jupiter, Minerva, and Mars. Sepulture reached a higher phase. The cult of the Druids was now extending, and had a large part in the religious, social, and probably political life of Old Britain.

The ordinary scholar or antiquary has been too apt to generalise all monuments which he cannot satisfactorily account for under the term Druidical; and it may be useful even here to treat them to a mild douche of explanatory chronology.

Druids and their cult are not heard of until 200 B.C., and it is held that Druidism originated in Britain and passed over into Gaul. The origin of customs and laws is traceable back to the neolithic period, and Druidism was quite probably at its height when Stonehenge was completed. It cannot be held as an inseparable part of the Celtic religion, but it is by no means proved that it was

universal in Britain. Druidism was doubtless of comparatively late growth, and the old temples and sepulchres met with in Ancient Britain have an ancestry far earlier than is suggested by the too general designation of 'Druids' stones.'

Divitiacus, an Arch-Druid, was a friend of Cæsar and of Cicero. The Druids, as a sacerdotal caste, resembled the Brahmans of India. Some of their customs were not peculiar to them; thus the cutting of the mistletoe was a German rite. Here is the adjuration of the Druids, as conceived by the Yorkshire antiquary, Godfrey Higgins, in his *Celtic Druids* (1829):

> By the bright circle of the golden sun,
> By the bright course of the errant moon,
> By the dread potency of every star,
> By the mysterious Zodiac's burning girth,
> By each and all of the supernal signs,
> We do adjure thee by this trusty blade
> To guard yon central oak whose holy stem
> Invokes the spirit of high Taranis.
> This be thy charge.

To Soldiers:

> Worship God, do no evil, be valiant in battle.

The voyage of Pytheas to Britain having prepared the way, as it were, for a further change, the Romans cast their eyes beyond the continent of Europe, and determined on exploring pastures new in the island visible from the shores of Gaul.

In 55 B.C. Julius Cæsar, the great Roman general, determined on landing in Britain—the 'Cassiterides,' or 'the Tin Islands'—of which he had heard as having been visited by the Phœnicians from southern Spain and the Greeks from Marseilles. 'In the war of the Gauls, he [Cæsar] resolved to pass into Britain, whose peoples had ever assisted the Gauls.' Cæsar landed in Kent in 55 B.C., at a spot between the North Foreland and Dover, and the scene of that debarkation is most graphically described by him. Cavalry, Balearic slingers, Numidian archers landed, and were met by the Britons with their chariots and hurlers of javelins.

Next year, 54 B.C., Cæsar again invaded Britain, landed between Sandown and Sandwich, and engaged with Cassivellaunus, the commander-in-chief of the Britons, who seems to have relied greatly on his force of chariots to keep the Romans at bay. Having defeated Cassivellaunus, Cæsar advanced inland, and crossed the Thames at some point between Richmond and Oxford. The most likely place is said to have been Brentford, and his march inland and his method of crossing the river were minutely recorded.

The result of the two campaigns of Julius Cæsar, as far as the Romans were concerned, was to open out new regions for conquest, to be entered upon in future years, and carried out by Plautius (41 A.D.), Agricola, Vespasian, Prefect Lollius Urbicus, and Septimius Severus.

But the chief operations of which we have any record were conducted by Agricola in his seven campaigns, culminating in 84 A.D. in the great battle of Mons Grampius, and his recall by the Emperor Domitian.

The effect was to introduce the British islands to the civilised world, to teach the Britons the arts of war and the methods of building and bridging, as well as to lay the foundation of many laws and customs traceable to this day. As an island of great natural wealth, Britain attracted the notice of the general traders of the world, and its position was geographically and politically recognised. So that we of the twentieth century look back with interest to the visit of Julius Cæsar to Ancient Britain, for it was then we were linked on to the highest civilisation in the world at the time.

CASIMIR LE SOMBRE.

CHAPTER XV.

AS I turned into the broad avenue of the Champs Elysées and walked up toward the Arc de Triomphe, I met a crowd of holiday folk enjoying the first really warm rays of the spring sunshine.

Nurses in spotless white caps and bright-coloured ribbons; charming children running and romping gaily among the trees, which were already bursting into leaf; dapper little soldiers in blue coats, red trousers, and white gaiters; stout, well-to-do shopkeepers, with their wives and families, all chatting, laughing, and sitting on the iron chairs in merry groups to watch the splendidly appointed carriages that were fast beginning to fill the central drive. Everybody seemed bright and happy except myself! Had none of these cheerful, smiling, well-dressed people any cares or memories of lost dear ones to temper their mirth? No doubt they had, for not a few of them were in black; but with the facile gaiety of their race they had thrown themselves heart and soul into the enjoyment of their holiday, and they were happy.

I soon discovered that I was not able to pass through the crowd without attracting attention. Many of the people that I met turned round and looked after me; some even overtook me and passed me again, not staring rudely, but evidently regarding me with curiosity. Was it because among all these joyous faces mine alone was sad? A whispered conversation that I overheard behind me solved the mystery. 'I tell you, *ma chère*,' said a voice, the bluff tones of which the speaker was trying in vain to subdue, 'it is a

boy, a handsome boy if you will, but still a boy in woman's clothes.'

Nor was the honest bourgeois who confided this theory to his wife to be blamed for his suspicion. My short-cut hair and the dragoon-like stride which I had acquired from the habit of walking about in spurs, with a sabre dangling at my heels, must truly have made me look very different from the coquettish little Parisians, tripping daintily along in their high-heeled shoes. Trying to subdue my walk to a more conventional standard, I at last got clear of the crowd and entered the *porte cochère* of a handsome hotel in the Avenue de l'Imperatrice, where, I had been told, the Countess lodged. The *concierge* said she was at home, and bade me ring at the right-hand door on the first floor; so, passing up a broad marble staircase, I soon found myself ushered into a handsome drawing-room full of mirrors, gilding, and costly upholstery, where everything seemed to speak of wealth and comfort.

'Will madame tell me her name?' said the servant with his hand on the door.

'Casimir,' I replied mechanically.

'Madame Casimir,' he repeated, and before I could stop him the man was gone. In a few minutes there was a rustle of silk behind me, and Deotima entered with that air of polite inquiry on her face with which people generally greet a complete stranger. I must have been sadly changed by my wound, for even when we stood face to face it was a moment or two before she recognised me; but when she *did*, a low cry of delighted surprise escaped from her lips, and her greeting was so tender, so warm, and sister-like that, as I was still far from strong, my eyes filled with tears—though not of pain.

'Here come Sigismund and Ladislas,' said Deotima at last, as she heard her husband's footstep on the stairs, 'and they shall thank you themselves.'

'Brother, this is the young soldier to whom you resigned your command, and to whom you owe your life.—Sigismund, you know that had it not been for Gabrielle your poor wife would now be in Siberia.' In their good-nature they would insist that I had done them all a great service, and if love and kindness on the part of my friends could have made me happy I ought to have been so.

Of course Deotima and the Count insisted that I should stay with them, and had I wished to move in the brilliant society of that gay capital I could have done so to my heart's content, for my story had got about, and many great ladies of the Faubourg St Germain begged the Countess as a special favour to bring me to their parties. Even the special correspondent of an English daily paper, a portly little Jew, whose head reached hardly as high as my shoulder, did me the honour to interview me. But all this gaiety and notice only caused me pain, and I longed to return to the rustic quiet of my native village, and be free to dream *alone* of the past among the hills and woods which had been so familiar to me in my happy childhood.

CHAPTER XVI.

IT was not without difficulty that I induced my kind host and hostess to consent to my leaving Paris, for they wished me to make my home with them always; but when they really discovered how ardently I longed to return to Alsace, they promised that if I would delay my departure till May they would themselves accompany me there, and see me settled in a new home before taking leave of me. Thus another month slipped away; and one lovely spring morning we all took our places in the train for the nearest station to my native village.

The only public conveyance we could obtain on our arrival was an old char-à-banc that had seen better days; but when the driver, cracking his long whip, shouted, '*Heu! heu!*' and the bells began to jangle on the horses' necks, I felt happier than if I had been driving in the Empress's carriage; for I was going *home*.

My heart beat fast and thick as I looked once again on the soft, undulating line of the Vosges mountains, clothed almost to their summits with waving chestnut-woods, and saw the little thatched hamlets nestling in the valleys, gay with bright gardens and rich, green pasture-lands—they spoke of *home!* Presently the driver discharged a whole volley of cracks from his whip, like pistol-shots, and we found ourselves jolting and bumping over the round stones that paved the long, straggling street of my own village. I was at *home!* Nothing seemed changed; there were the Père Galoche, our old Tourenne cooper, and the Mère Poupo with her seven children in white caps and blue pinafores, and Fritz the sabot-maker, all sitting at their doors just as I left them sitting there two years before.

And that pretty girl in black with golden hair—why, that must be little Eulalie; but what a change those two years have made in her! Ah! there is Monsieur le Curé, who chided my poor father for dressing me in boy's clothes; he is getting very old now, and, like the others, does not recognise me as he politely lifts his shovel-hat in return to the Count's salutation.

Now we approach the 'Boule d'Or,' and I can see the buxom landlady smiling welcome as she watches our char-à-banc from the door; but we pass her by, and I look at Deotima inquiringly, for there is no other inn in the village.

'Sigismund has got a little cottage in the neighbourhood,' she says rather nervously, 'and we thought it would be pleasanter for you to come and stay with us for a few days till your plans are settled.'

So we emerge again on the long, straight road bordered with trees, and I soon catch sight of the white wall of my father's garden, and eagerly point it out to Deotima, who only smiles and nods.

Then—am I dreaming?—the char-à-banc pulls up at the gate, a motherly-looking servant in a snowy-white cap runs out with a pleasant greeting, and in another moment I am handed into the old familiar parlour where I have so often sat listening to my father fighting his battles over again, after the manner of old soldiers.

How the home-memories crowd upon me! for though the rooms have been freshly painted and papered, and the furniture newly covered, everything looks so familiar.

'The fact is,' says Deotima, speaking very fast, 'Sigismund heard about a month ago that the old Chevalier from whom your father rented this cottage had died, and—and we took the liberty of buying it in your name; and if you will not accept so small a souvenir from us, why, we will never speak to you again. No, I *will not* listen to a word. Come, dear, you must let me show you your room;' for she sees that my heart is too full to answer.

'And how can I accept all this from you who have lost so much?' I asked that evening as we were all seated round the dinner-table.

'Why,' said the Count gaily, 'we are not so hard up as all that. It is true, poor Deotima has lost her jewels, but they realised over a million of francs, and a little bird tells me it is not impossible that I may even save my estates; money and interest will do a great deal in Russia, and I still have a few friends in high places.'

They stayed with me a week, and then returned to Paris. When Deotima was putting on her hat in my room on the last day, and the old char-à-banc was waiting at the door, she said archly, 'You will be getting married soon, Gabrielle, and, mind, we are to have an invitation to the wedding—that's a promise. Sigismund will be so disappointed if you don't let him give you away.'

'No,' I replied wearily, for her playful speech brought back all the old pain, 'I shall not marry even if I live to the age of Père Galoche.' And I honestly thought *then* that I was speaking the truth.

'Nonsense,' cried Deotima, seizing me round the waist and drawing me to the glass. 'Look in *there* and see if your own face doesn't tell you a different story. Why, child, let me see; you are only just nineteen, and quite an eligible *parti*, too, with your house and your garden and your father's 3 per cent. Rentes. Ah, I fear the young men are more mercenary in France than they are with us; you will have to come back to Poland if you want to find a good husband.'

She little knew how her words pained me, for was not my heart already in Poland, buried with my poor Maurice in the dark waters of that fatal swamp!'

CHAPTER XVII.

THE spring bloomed into glorious summer, summer ripened into fruitful autumn, the corn was cut in the yellow fields, the grapes grew ruddy on the trailing vines, the vineyards rang with the merry voices of women and children gathering the juicy harvest; and still I lived apart in my pretty cottage, dreaming of the past, not bitterly, but gravely and sadly; trying to find occupation in the homely duties around me, visiting the sick or helping the poor according to my modest means, tending my little garden, and occasionally taking long walks into the country, where the sweet companionship of birds and insects, rippling brooks and rustling woods, soothed my spirit, and at last taught me the lesson that the world of nature around me is *always* beautiful in every varying phase, and that it is the discontent of our own hearts alone that makes it ever appear dark and sad.

Thus time glided quietly by, till one evening near the close of the vintage season, when all our people were away at the vine-presses, and the sun was sinking slowly behind the purple line of mountains in a tender glow of golden light, as I was working in my garden I heard the distant tones of a violin.

The sound made my heart beat, for it brought back memories of that ride through the sombre glades of the Polish pine-forest when I first met Maurice; and going to the little green gate, I leant over it and looked along the straight, dusty, sunlit road, across which the tall poplar-trees cast their shadows in parallel lines like the rungs of a ladder.

Slowly climbing up this shadowy ladder came the figure of a poor beggar-man, stopping every now and then before the windows of some cottage to play the violin he held in his hand, and then wearily resuming his journey, for the villagers were away in the vineyards, and there was no one to give him money.

At last he paused before my own house and struck up a lively little gavotte which I believe was composed by Louis the Thirteenth; but its gaiety only brought tears to my eyes, for it had been a favourite with Maurice. Crossing the road hastily, I placed a franc in his hat, and as I did so I noticed that he reeled slightly and sat down on the bank with his hand to his forehead.

'It is nothing,' he said faintly; 'I have not tasted food since yesterday. Thank you for your charity, mademoiselle.'

His face turned towards mine with the dying glory of the sun upon it, and *then* I knew him.

Pale, careworn, and emaciated, it was my own Maurice risen from the dead!

'Come in,' I said hoarsely, almost choked with my own emotion; and, taking him by the arm, I led him into the parlour and placed food and wine before him. He ate it gratefully, as one who has not tasted food for many hours; but every now and then I saw his large blue eyes turned on mine with a strange, dreamy, wondering expression.

'You have a good heart, mademoiselle,' he said at last. 'Do you know, you remind me somehow of a dear friend whom I have lost.'

'Really! How did you lose him?' I asked in a strange, muffled voice which I hardly recognised as my own.

'He was my commander, mademoiselle. I was a soldier once, and we were parted by—the chances of war. Poor Casimir! I afterwards heard that he had been shot.'

'But how were you parted?' I asked in the same strange voice.

'I was badly wounded and left for dead in a Polish swamp. When I recovered consciousness I was lying up to my neck in water. It was night, and I could see the Russians—against whom we had been fighting—hunting about for their dead with lanterns, so I had to remain in my hiding-place till morning, and this gave me the fever. I believe I wandered about the woods in a delirious state till some good peasants found me and nursed me kindly, for the Russians had left their village. It was many months before I was able to get about, and then no one was allowed to cross the frontier without a pass; so I stayed with my kind preservers, trying to do what work I could to repay them for their hospitality.

'At last I succeeded in reaching Austrian Poland, and the French Consul gave me some money, with which I bought this fiddle; but the authorities ordered me to leave the country, and I begged my way till I reached France. I had written home two or three times, but my letters were either stopped or lost, and I got no reply; so I am now on my way to my native village to prove my identity, for I am an orphan, mademoiselle, and I fear all my little property has gone to strangers. I have had many trials,' he continued, sighing, 'and your kind face reminds me of the friend whose loss seems the hardest trial of all. He did not love me as I loved him, and yet once I thought, as I lay wounded in his arms, he kissed me on the forehead, and spoke to me as tenderly as a woman could have done. Ah, mademoiselle, you have a good heart;' for he saw that my face was bathed in tears.

'Oh Maurice!' I said, 'I am your friend Casimir. Do you not know me?' And all my heart seemed to go out to him in that cry. He grew deadly pale and rose from his seat, looking at me eagerly by the fading light that streamed through the little window.

'You Casimir, my old leader! You—a girl!' he said with a half-sob. 'Yes, it is—it *is* the same face! Ah! this accounts for the strange way in which I felt drawn towards you.' Then our eyes met, and opening his arms, he took me into them.

CHAPTER XVIII.

MAURICE did not continue his journey that night, but stayed at the 'Boule d'Or,' and shortly afterwards, with the assistance and advice of my father's old friend the Juge de Paix, he was able to prove his identity and recover his property.

One sunny day late in the autumn, when the woods had put on their robe of russet leaves and the mountain-peaks were sparkling with freshly fallen snow, we two were made one before the altar of our little church.

The Count and Countess, true to their promise, were there to give me away; and before returning to Paris, Deotima hung round my neck a beautiful gold chain to which was suspended a locket with a White Eagle on it set in diamonds. Of the five happy years we spent in our Alsatian home till the disastrous war between France and Germany broke out I need not speak. Then some of the principal people of our district, to whom my story was known, came and formally asked me to take command of a corps of Franc-Tireurs, in my old character of a guerilla leader. But while I was still thinking what to reply, our little Deotima opened her innocent blue eyes and smiled at me from her cot; and if before I had any doubts whether women should take part in scenes of bloodshed and violence, I now felt quite certain that a mother ought not to do so.

Maurice, therefore, took the command of the Franc-Tireurs and fought all through the war, while I busied myself in organising an ambulance staff.

After Alsace and Lorraine were finally ceded to Germany, we sold our house and bought a pretty little estate on the banks of the Loire, in that part of Touraine which is called the 'Garden of France,' and where the softly wooded hills sometimes remind me of my native valley. Here the Count and Countess, who have now regained their possessions in Poland, often come to visit us; and over the fireplace in our drawing-room hangs a sword of honour which was presented to Maurice by the members of his corps, together with the sabre that I once wore as Casimir le Sombre.

THE END.

OUR MOTHER MOSCOW.

PART II.—A DAY'S SIGHT-SEEING IN MOSCOW.

THE next morning on entering my sitting-room I was greeted by a flood of sunshine. I wondered whether it was very cold; the rooms being at one uniform high temperature, it was impossible to tell. So I mounted upon a table in order to open the one and only little square pane which was openable at the top of the window, and, lo! I was in the midst of a miniature snowstorm; everything in the room was covered with tiny particles of snow, and I felt a stinging sensation of cold. I promptly shut the aperture, wiped the furniture guiltily, and calling to mind forgotten science, concluded that the air in the room had frozen, with the above result.

At all events one fact was clear: it was a day for furs; so, enveloped in furs, I stepped into my friend's *troika* (that is, a three-horsed vehicle like a victoria, very near the ground and decidedly narrow for two people). The horses, all three abreast, were very fine, and against the middle beast I have nothing, but the two outside animals turned their heads incessantly towards us, the right-hand one keeping his eye determinedly on me, while the other one observed his mistress. This is an acquired accomplishment and much admired in Russia; unfortunately to English eyes it is reminiscent of a circus performance. Moreover, we were decidedly over-horsed, with the result that we sped over the snow at breakneck speed along streets crowded with traffic, and round corners which, if a church happened to be situated there, were dangerous, as the coachman, on arriving in front of the church door or of the holy picture which is to be found outside most churches in Russia, divides his attention between his horse and his devotions. Having taken off his fur hat, our coachman tucked it under his arm; one hand was occupied in crossing himself innumerable times, and this left only his left hand free for driving. The only fairly safe drive I ever took in Moscow was with a godless cabby, who passed churches and even the holiest shrine without any notice.

Our coachman was a quaint enough figure in his astrakhan turban, and enveloped in a long, wadded, full-skirted, blue cloth coat, which broadened out from the shoulders, was about two yards round where the waist generally is, and from there resembled a crinoline. The more inflated your coachman the smarter, and in the merchant classes his belt—of two yards, remember—and his buttons are often costly and gorgeous affairs.

The attitude of Russians of the upper class towards their servants struck me as half parental and half that of a slave-owner. My friend was very good and kind to her servants, and they seemed to regard her with great affection; her maid had been in the family sixty years, and was treated like a valued friend. All the family kissed her affectionately when leaving home, and yet I have heard her scolded like a naughty child.
